## SALES BY AUCTION.

## Anthurium Andreanum.

MR. J. C. STEVENS has received instructions from Mr. F. Sander to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, May 5, at half-past 12 o'clock precisely, a splendid importation of

## ANTHURIUM ANDREANUM.

collected and brought home by Mr. F. C. Lehmann. The plants are in splendid growing condition, with healthy leaves and growths. This grand species far surpasses in beauty the well known Anthurium Scherzerianum, its colours being more vivid, and the size of the flowers immense. The plant was described in the *Gardeners' Chronicle* of April 10, p. 464, and it says:—"This time a plant which attracted all eyes was Anthurium Andreanum;" and again it is fully described and figured in the *Gardeners' Chronicle*, April 17, p. 499, which states:—"This is the very striking plant which we noticed last week as having been exhibited at Ghent, where it attracted much interest; a similar feeling was experienced here when the plant was shown before the Floral Committee of the Royal Horticultural Society. The plant is an Aroid of tufted habit, with oblong, cordate, glabrous, leathery leaves, dark green above, paler beneath, and marked by comparatively few but prominent nerves; the leaf-stalks are ascending cylindrically, slender and thickened at the top, the blade being attached, as it were, hinge-wise, so as to allow of varying positions, deflexed or spreading. The flower-stalk is double the length of the leaf-stalk."

Undoubtedly the plant is one of the most brilliant and remarkable discoveries of recent times. Those who remember what Anthurium Scherzerianum was on its first introduction and what it is now, are justified in looking forward to the career of the present plant as of quite exceptional importance. This is fully borne out by the statements of Mr. Lehmann. The flower lasts in beauty four months, its colour is most brilliant, and the plant is of easy cultivation. It grows at an elevation of from 3500 to 4200 feet, and in a temperature of from 60° to 70° would suit it best.

At the same time will be Sold a splendid importation of the rose-coloured variety of ODONTOGLOSSUM VEXILLARIUM, the grand new blue-flowering PESCATORIA LEHMANNI, and ODONTOGLOSSUM ALEXANDRÆ LEHMANNI. Also various other ORCHIDS, together with a splendid lot of the Burmah variety of VANDA CŒRULEA, collected by Mr. Freeman. Flowers and Drawings on day of Sale.

May be viewed the morning of Sale, and Catalogues had.

## Vanda cœrulea, Burmah Variety.

MR. J. C. STEVENS has received instructions from Mr. F. Sander to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, May 5, at half-past 12 o'clock precisely, a splendid importation of VANDA CŒRULEA, collected by Mr. W. B. Fresman. The variety offered has immense flower-spikes and very broad leaves, and is of sturdy growth. Collector says flowers are much larger and darker than the Kasia Hill variety. The plants are in a healthy state of growth and in altogether splendid condition, and among the importations will be found extra large masses. See flower-spikes on plants. May be viewed the morning of Sale, and Catalogues had.

## Established and Imported Orchids.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, May 10, at half-past 12 o'clock precisely, several small collections of ESTABLISHED ORCHIDS, consisting of *Odontoglossum vexillarium*, *O. crispum*, *O. triumphans*, and others; *Angraecum sesquipedale*, *Madevillia*, *Cypripedium*, *Dendrobium*, &c., in variety; also several importations of *Dendrobium formosum giganteum*, *D. tortile roseum*, *Cattleya citrina*, *C. Mendelii*, *Saccolabium guttatum*, *Cypripedium Stonei*, *Hookera*, *Dayanum*, &c., in fine condition. May be viewed the morning of Sale, and Catalogues had.

## Dendrobium Jamesianum.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, May 10, at half-past 12 o'clock precisely, a quantity of plants of this beautiful and rare DENDROBIUM, just received from Burmah, where it grows at an altitude of 4000 feet in a cool temperature; added to the beauty of its flowers, the length of time they last makes it a desirable species in every collection. May be viewed the morning of Sale, and Catalogues had.

## Dendrobium litniflorum.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, May 10, at half-past 12 o'clock precisely, a quantity of plants of DENDROBIUM LITNIFLORUM. This is the beautiful Burmese variety, just received from Burmah in good condition. May be viewed the morning of Sale, and Catalogues had.

## Important Collection of Established Orchids.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on TUESDAY, May 11, at half-past 12 o'clock precisely, a COLLECTION of ESTABLISHED ORCHIDS, the property of W. S. Gore Langton, Esq., M.P., of Newton Park, Bristol, comprising many of the finest plants and varieties in existence. Amongst them will be found *Saccolabium guttatum*, *Loddige's var.*, which plant gained the Veitch's Memorial Medal, June 24, 1873, at the Horticultural Exhibition at Bath; other fine specimens, such as *Dendrobium filiforme*; *Aerides Lindleyana*, fine specimen and splendid variety; *Angraecum sesquipedale superbum*; *Cattleya Skinneri*, five new growths; *Dendrobium densiflorum*; *Aerides Fieldingii* and *Lobbia*; *Cattleya gigas*, *Odontoglossum Roezlii*, *Vanda Davis*, *Veitch's var.*; *Vanda tricolor*, a splendid large variety; *Vanda insignis*, *Camarotis purpurea*, *Aerides affine majus*, *Phalenopsis amabilis* and *Schilleriana*, and many other valuable sorts. May be viewed the morning of Sale, and Catalogues had.

## Highly Important Sale of Established Orchids.

MR. J. C. STEVENS has received instructions from W. Turner, Esq., Over Hall, Winsford, Cheshire, to offer for SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, June 2, and following days (instead of the days previously announced), at half-past 12 o'clock precisely each day, without the least reserve, the entire COLLECTION of ESTABLISHED ORCHIDS. Amongst other grand things will be found *Lælia Warneri*, *Saccolabium Turneri* (spikes nearly 2 feet long), *Cattleya Skinneri alba*, *C. Morgani*, *C. Wagneri*, *Lælia Wilhami*, and many other rare and valuable plants. May be viewed the morning of Sale, and Catalogues had.

## Established and Imported Orchids.

## MONDAY NEXT.

MESSRS. PROTHEROE AND MORRIS will SELL at the Mart, Tokenhouse Yard, E.C., on MONDAY NEXT, at half-past 11 o'clock, a collection of about 400 lots of ESTABLISHED ORCHIDS, in the best possible condition, many of them showing flower, including *Cattleya Warneri*, *C. exoniensis*, *Madevillia Chiriana*, *M. Harryana*, *M. Ignea*, *Odontoglossum vexillarium*, *O. Pescatorei*, *O. Alexandræ*, *Cypripedium niveum*, *C. caudata*, *Cymbidium eburneum*, *C. Lowii*, *Dendrobium Griffithianum*, *D. Farmeri*, *D. Wardianum*, *Oncidium curtum*, &c.; a variety of STOVE and GREENHOUSE PLANTS, IMPORTED ORCHIDS, and a Consignment of CYCAS MEDIA, from Australia. Catalogues at the Mart, and 98, Gracechurch Street, E.C.

## Established Orchids.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at the Mart, E.C., on MONDAY, May 10, 400 lots of ESTABLISHED ORCHIDS. Further particulars next week. Catalogues at the Mart, and 98, Gracechurch Street, E.C.

## The Beech Nurseries, Southend.

MESSRS. PROTHEROE AND MORRIS beg to announce that this Property was NOT SOLD at the AUCTION on MONDAY LAST, and may be treated for privately. Particulars and price at the Auctioneers' Office, 98, Gracechurch Street, E.C.

Wiltshire, 5½ miles from Swindon Junction, where the Metropolitan is reached in 2 hours, and within about a mile of the Purton Station on the Great Western Railway. An extremely choice FREEHOLD RESIDENTIAL PROPERTY, of remarkable beauty, distinguished as Purton House, in the parish of Purton, situate near the pleasant village of Purton, and close to the interesting church. The residence is solidly constructed of stone, and presents an agreeable elevation in the classic style. It is most conveniently arranged, and briefly comprises 4 Reception Rooms and 16 Bed, Secondary, and Servants' Bedchambers, Bath-room, and ample Domestic Accommodation; Stabling for 6 horses, Carriage-house, and Dwelling-rooms over, and every appurtenance essential to a well-ordered English country residence. The Pleasure Grounds are singularly beautiful, and are adorned with a large lake fed by a perennial spring, affording bathing, boating, excellent fishing, and skating. There are Croquet and Archery Grounds, Lawn Tennis Court, walled Kitchen and Fruit Gardens, Orchard, Vinery, and Fencing-houses, and other accessories. The grounds are encircled by finely-timbered and most luxuriant pasture land, bounded on the south by a woodland walk. The estate adjoins the lands of the Earl of Shaftesbury, and there is a good frontage to the road. The whole demesne a little exceeds 30 acres in extent. Immediate possession may be had on completion of the purchase.

MR. ROBINS (of 5, Waterloo Place, Pall Mall, London) is honoured with directions from H.H. the Rajah Brooke, who is returning to Sarawak, to offer the above RESIDENTIAL PROPERTY to PUBLIC COMPETITION (unless an acceptable offer should be previously received), at the Mart, Tokenhouse Yard, Lothbury, E.C., on FRIDAY, May 21, at 1 for 2 o'clock precisely, in one lot. The Property may be viewed by orders only, obtainable of the Auctioneer.

Particulars, Plans, and Views, may be had of Messrs. BOOBY AND BAYLIFFE, Solicitors, 1, Raymond Buildings, Gray's Inn, W.C.; at the Mart; and of Mr. ROBINS.

FOR SALE, a Small, Old-established NURSERY, cheap, with Houses and Frames complete. Apply on the Premises, 22, Jeffrey's Road, Clapham, S.W.

Grange Nursery, Heaton Mersey, near Manchester. TO BE DISPOSED OF, by Private Treaty,

Grange Villa, Heaton Mersey, with the site thereof and adjoining Land used as a Nursery, and containing together by admeasurement 14,520 square yards or thereabouts. The house comprises Dining, Drawing and Breakfast-rooms, with Kitchen, Scullery, Six Bed-rooms, Dressing-room, Water-closet, and Store-room, and is Cellared throughout. The Outbuildings consist of Stabling for Three Horses, Coach-house and Harness-room, with large Loft and Store-cupboard, Cow-house, Piggeries, Pigeon-house, and Hen-house. There is a Greenhouse attached to the house. On the land there is erected a range of Glass 225 feet long, consisting of Vineries, Fernery, Greenhouse, and Propagating Pit. There are materials on the ground requisite for erecting another Range of Glass, the foundations for which are already laid. There is a good Stock of Rose Trees, Shrubs, Fruit Trees, and other Plants, Flowers, &c. The Premises have for some time been used as a Nursery by the late proprietor, Mr. Thomas Studd deceased, and are replete with every convenience for carrying on the Business of a Nurseryman. The situation is healthy, and the premises command an extensive view of the Derbyshire Hills, Alderley Edge and Bowdon.

The Premises can be inspected on application at the House, and any further information can be obtained from Mr. W. R. MINOR, Solicitor, 26, Brown Street, Manchester.

Fifty Nurseries, Market Gardens, Florist and Seed BUSINESSSES to be DISPOSED OF.

MESSRS. PROTHEROE AND MORRIS, HORTICULTURAL REGISTER contains full particulars of the above, and can be obtained gratis at 98, Gracechurch Street, E.C.

Packing included. Terms cash. Cemetery Nursery, Gravesend.

# NEW PLANTS FOR 1880.

## B. S. WILLIAMS

Has much pleasure in intimating that he is now sending out the following New Plants, for the first time, all of which will be found great improvements upon any hitherto offered:—

### ALPINIA ALBO-LINEATA.

A very striking and beautifully variegated Stove Plant, 3 to 4 feet high when fully developed. The leaves are 9 to 12 inches long, elliptic-lanceolate, pale green, marked divergently with broad bands of white and pale green. This is a grand addition to our ornamental Stove Plants, and makes a fine contrast intermixed with other Foliage Plants.

Native of New Guinea. Price 10s. 6d. to 21s. each.

### ALSOPHILA LUNULATA (R. Brown).

A Polynesian Tree Fern, called "Balabula" in the Fijian vernacular. It is a common plant throughout the group, its stems attaining a height of about 25 feet, and a thickness of 8 to 10 inches, with a magnificent crown of fronds, which renders it a noble feature in the landscape. The fronds are large, tripinnate, with a nerved stramineous rachis; the pinnae are from 1½ to 2 feet long, furnished with close sessile pinnules, 4 to 5 inches long, and divided into close-set ligulate falcate blunt segments an inch long, with crenulate margins. The fronds are green and glabrous on both surfaces, and of a subcoriaceous texture; the midrib below being sometimes furnished with a few scales. The sori are minute, and placed near the midrib. In the Fijijs, according to Dr. Seemann, the trunks are used as posts, and are very durable; while the abundant scales which cover the stipes are used by the white settlers as a luxury for stuffing pillows, since they do not become so much heated as feathers. As an ornamental Tree Fern for a house of intermediate temperature no finer object could be desired.

Price 21s. each.

### ARALIA MONSTROSA.

This is a very elegant and distinct Aralia, admirably adapted for table decoration and ornamental purposes generally, where variegated plants are required. The leaves are pendent, pinnate, having three to seven oblong elliptic leaflets deeply and irregularly serrated; sometimes the serration takes most fantastic forms, and gives the leaves an altogether unique appearance. The leaflets are broadly margined with creamy-white, the surface blushed with grey.

Native of the South Sea Islands. Price 21s. each.

### ASPENIUM NOVÆ-CALEDONIÆ (Hooker).

This strikingly distinct Fern belongs to the groups of Dareae, a section of Asplenium, in which the veins are simple in the ultimate divisions of the frond, and in which the sori are consequently solitary in each segment. The fronds are remarkable for the coriaceous character of the long narrow divisions, which are not much wider than the rachises to which they are attached. The frond itself is somewhat triangular in outline, tripinnately divided, both the lower pinnae and the pinnules being deltoid, while the rigid segments are half an inch long or more, and distant from each other, the pinnules being also distant from the main rachis, so that the centre of the frond is peculiarly open, while the long interlacing segments of the adjacent pinnae give a crowded appearance to the circumference. The sorus occupies one side of the segment, and nearly equals it in length. The plant, which, as its name indicates, comes from New Caledonia, is an evergreen, and will be a useful acquisition amongst those of well-marked character, cultivated in our warm ferneries.

Introduced by us from New Caledonia.

Price 21s. each.

### ASPENIUM SANDERSONI (Hooker).

A charming dwarf-growing tufted evergreen Fern, with spreading fronds, which are proliferous at the tips, and bear a solitary proliferous bud on each of the small peculiar-formed pinnae. The fronds are 8 to 10 inches long, narrow-linear in form, pinnate in division, the rachis slightly winged, the pinnae shortly stalked, set on obliquely, somewhat deflexed, about half-an-inch long, eccentric, the posterior side straight or entire, curved backwards, the anterior side divided into a few blunt rounded teeth. On the upper side towards the apex is a small black dot, which on examination is seen to be a bud; the rachis also runs out beyond the upper diminished pinnae, and terminates in a bud. The small size and well marked form of the pinnae give it a very elegant aspect, and recommend it as a useful basket Fern of small size. The membranaceous edge of the indusium is pectinately fringed. It is a native of Natal, and therefore may be grown in a greenhouse.

Price 21s. each.

### AZALEA "MRS. GERARD LEIGH."

This Azalea is of the same parentage as the six varieties we had the pleasure of offering in 1878, and which have now become so generally popular. This variety has, however, the advantage of producing much larger trusses, several of which on a plant we flowered this year contained as many as fourteen or sixteen flowers, quite Rhododendron like. The colour of the flowers is bright rose. It is well adapted for cut-flower work, and is very effective as a decorative plant, and like *A. amena* requires but little forcing; it may be had in bloom from November till Spring, by having a succession of plants to come in at different times. This is, without doubt, the grandest variety of this new type of Azalea.

Price 21s. each.

### BAMBUSA MAXIMOWICZII VITTATA.

The Bamboo has long been a great favourite as a decorative plant for conservatories and lawns, on account of its graceful and delicate foliage. The plant before us will therefore be welcome on account of its variegation, as producing a fine contrast with the many green varieties already in cultivation; the leaves of this variety are distinctly longitudinally variegated with pure white and light green.

Price 10s. 6d. each.

### BEGONIA "BRILLIANT."

The name of the new Begonia is legion now-a-days, and many growers are somewhat shy in taking up with new varieties. There need be no fear, however, with the one now before us, as it is totally distinct both in habit and profuseness from anything we have yet seen. The habit is dwarf and robust, the flowers produced in profusion, several together, from the axils of the leaves, bright scarlet vermilion in colour. This plant is well adapted for either bedding purposes or pot culture.

Awarded a First class Certificate by the Royal Horticultural Society.

Price 10s. 6d. each.

### COLEUS "MRS. GEORGE SIMPSON."

This is undoubtedly the most distinct and attractive Coleus we have yet seen, and is the commencement of quite a new type. The leaves are 7 inches long by 5 inches broad, ground colour bright crimson, suffused with rich dark velvety crimson, in some cases almost black. It is of free branching habit, and makes a splendid pot plant.

Awarded a First-class Certificate by the Royal Horticultural Society.

Price 10s. 6d. each.

### CELOGYNE OCELLATA MAXIMA (Rehb. f.).

This is a great beauty, and flowers in March and April, the flowers lasting a long time in perfection; pure white, with rich orange spots on the lip, encircled with light brown.

Professor Reichenbach says of this beautiful Orchid—"According to my taste it is a great beauty, it is far stronger than the common plant, having a rich flowered raceme of expanded blossoms coming near those of *C. cristata*; the colour is a usual one, the lateral yellow blotches spread widely apart, the anterior central is confluent and overrun by side keels, these, quite outside, being the adventitious ones urged by Dr. Lindley. I am told that the bulbs are a good deal larger than those of the genuine species, being 3 inches in circumference. The inferior sheath under the inflorescence usually persistent in this species is very much developed." This plant has received a First-class Certificate.

Price 105s. to 147s. each.

### CROTON STEWARTII.

One of the most distinct Crotons ever offered of the broad-leaved kinds, the habit is dwarf and bushy, and this variety colours when in a very small state. The leaves are obovate, tailed, rounded at the base, shortly stalked, dark olive-green, irregularly banded and margined with rich orange; the midrib and petioles are bright magenta, which produces a striking contrast to the carmine markings on the remaining portion of the leaf. This variety is named after A. B. Stewart, Esq., of Glasgow, an ardent admirer of this popular class of plants.

Introduced by us from New Guinea.

Price 31s. 6d. each.

### CROTON WARRENI.

This is truly a grand Croton, of free-growing bold habit, producing spiral linear-lanceolate leaves, from 25 to 30 inches long, by 1 to 1½ inch broad, pendent, arching, dark green irregularly mottled and suffused with orange-yellow and carmine, which in the old leaves changes to rich crimson. This is the most graceful rich coloured Croton we have yet introduced, and has been pronounced by all who have seen it to be the king of the narrow-leaved varieties of this popular genus. It is suitable either as an exhibition or decorative plant, and as an object for the dinner-table is unsurpassed. It is named after G. Warren, Esq., Handcross Park, Crawley, a great admirer of this fine class of plants.

Introduced by us from the South Sea Islands.

Price 31s. 6d. each.

### CROTON WILSONI.

An elegant bright-coloured variety of the narrow-leaved type, of free branching habit, with leaves 18 to 20 inches long, and 1 to 1½ inch broad, linear-lanceolate, pendent, arching, bright green, irregularly suffused with rich yellow. This will make a grand table plant, and form a fine contrast with the above described variety.

Introduced by us from New Guinea.

Price 31s. 6d. each.

### DIPLADENIA PROFUSA.

This grand species will prove invaluable as an exhibition plant, being very floriferous in character, blooming when very small, and lasting a long time in perfection. The flowers are 5 inches in diameter, rich carmine, of fine substance, produced abundantly in bunches from the axils of the leaves. This species has the best constitution of any Dipladenia we have grown, keeping its foliage nearly all the season. There is no plant more beautiful than the Dipladenia, lasting as it does four to five months in flower. It is very useful for cut-flower work, and lasts a long time in water; its flowers may be taken from the plant without cutting the stem, as many flowers are produced from the same spike. For training along the roof of a stove, as a climber, the Dipladenia is unsurpassed.

Price 21s. to 42s. each.

### DRACÆNA "EARL OF DERBY."

This is a highly coloured and most effective variety, with recurved oblong leaves 14 to 18 in. long, by 4 to 5 inches broad; bright green, broadly margined with rosy-crimson, which in the young leaves become partly suffused over the remaining portion of the surface. The leaf-stalks are also well coloured. It is a good ornamental variety, somewhat after the style of *D. Cooperi*, but superior to it on account of its robustness and the brighter colouring of its leaves. It also colours in much smaller plants.

Introduced by us from the South Sea Islands. This plant has received a First-class Certificate.

Price 21s. each.

### DRACÆNA MIRABILE.

A very pretty variety, with leaves 18 to 20 inches long, by 3 to 4 inches broad, of dwarf stocky habit; pale green, with various shades of creamy white and bright rose colour. This will make a fine distinct variety in a collection for exhibition.

Introduced by us from the South Sea Islands.

Price 21s. each.

### ERANTHEMUM ALBO-MARGINATUM.

A very pretty ornamental plant, with oblong elliptic leaves, 4 to 6 inches long, by 2 to 3 inches broad, broadly margined with white, and irregularly suffused with grey.

Native of the South Sea Islands. Price 7s. 6d. each.

### HIBISCUS BAPTISTII.

A very handsome species, with brilliant crimson-scarlet double flowers, of which the petals are of good substance, crimson-scarlet, flaked with cream colour at the base. This is one of the finest of the double-flowered kinds, and is quite distinct from anything hitherto sent out.

Native of the South Sea Islands. Price 10s. 6d. each.

### LASTREA MEMBRANIFOLIA (Presl).

This is a recent introduction to our gardens from the Islands of the Pacific, and is a neat-growing species, with a short erect stem or crown, from which the moderate-sized but broadish-lobed fronds arch out gracefully on all sides. The fronds have a pubescent scaly stipes 6 or 8 inches long, and an ovate caudately-acuminate lamina of a foot or more in length; they are pinnately divided, the pair of lower pinnae being similar in form, and divided at the base into a few crenately toothed falcate lobes. The upper pinnae being narrower, the uppermost adnately decurrent, so as to become confluent into a pinnatifid apex, the divisions of which are coarsely toothed, and the sori are numerous. The long caudate apices of the frond and of each of the pinnae give it a peculiar and elegant character. The colour of the frond is an opaque green.

Price 10s. 6d. each.

# B. S. WILLIAMS' NEW PLANTS, 1880—(Continued).

## IXORA PICTURATA.

A very beautiful and distinct hybrid between *I. Williamsii* and *I. coccinea*, having leaves and growth after the style of *I. Williamsii*, and flowers intermediate between the two, with the fine compact truss of *I. coccinea*, and the size of flower of *I. Williamsii*. This is a great acquisition, as *I. coccinea* is always a bad grower, and becomes spotted on the leaves when exposed to the least cold; it will, therefore, be in great demand as an exhibition plant.

Price 21s. each.

## LYCOPodium ULCIFOLIUM.

This beautiful Indian Lycopod, called also *L. Hookerii* and *L. pulcherrimum*, has been lately imported by us from Khasya, and will be a welcome introduction to all collections of ornamental plants. It is of pendulous habit, producing dichotomously branched stems 2 feet long, which are densely clothed with linear-lanceolate very sharply pointed leaves, giving to the leafy portion of the stems the thickness of one's little finger. Towards the ends, the branches change into drooping fertile spikes, 6 inches long or more; these, in many cases, but not always, being dichotomously forked. The spikes, like the branches, are thickly clothed with leaves, each containing a spore-case in its axil; but they have a peculiar appearance from being distinctly smaller in bulb, not much exceeding the thickness of a stout goose-quill. The pendulous habit and bright green colour give it a very elegant appearance, and will make it a desirable acquisition wherever drooping plants can be appropriately introduced.

Price 10s. 6d. each.

## NEPENTHES LAWRENCIANA.

A very distinct hybrid between *N. phyllamphora* and *N. Hookerii*, with pitchers 4 inches long, ground colour pale green, spotted profusely with dark crimson. The plant is very compact in its habit of growth, and produces its pitchers very freely; the edges of the leaves are slightly serrated.

Price 105s. each.

## NEPENTHES OUTRAMIANA.

This is a grand Pitcher-plant, with pitchers 5 inches long, of fine form, ground colour pale yellowish-green, densely spotted with dark blood-red; in some instances the markings coalesce and nearly cover the entire surface. The interior and mouth are also well marked in this species. This is a very free grower, and produces its pitchers abundantly.

Price 105s. each.

## NEPENTHES ROBUSTA.

A very free-growing hybrid, the result of a cross between *N. Hookerii* and *N. phyllamphora*, with pitchers intermediate between the two, with the colour and markings of *N. Hookerii*. This is a very distinct-shaped pitcher, the lower portion being much wider than the upper, having somewhat the appearance of a Pear.

Price 105s. each.

## NEPENTHES "WILLIAMSII."

This is indeed a gem, and with the exception of *N. sanguinea* has the brightest red "pitcher" we have seen. It is the result of a cross between *N. Sedeni* and *N. Hookerii*, having a pitcher in shape intermediate between the two parents, 4 to 5 inches long, densely spotted with blood-red, the red in many cases predominating. The interior is also marked with the same colour; the under side of the lid with reddish-brown. It is a very compact grower, and pitchers very freely in a small state.

Price 105s. each.

## OLEOBACHIA PALUSTRIS.

This is a very elegant plant, having the general appearance of *Aralia Veitchii*, with green leaves; it has, however, an advantage over that plant, inasmuch as it succeeds well in a greenhouse temperature. The leaves are digitate, with five to seven filiform leaflets, produced upon a simple stem, dark green, with pale green midrib. This is a great acquisition as a table plant, and one that will become universally popular.

Price 21s. each.

## PANAX ELEGANS.

This is a great improvement on the old *P. excelsa*, and is of dense habit, the leaves are very finely divided, and it has the advantage of keeping its leaves during exposure to a cold atmosphere. This will prove a valuable exhibition plant, as it attains large dimensions.

Price 10s. 6d. each.

## PTERIS INTERNATA (Moore).

A pretty evergreen hothouse Fern, of dwarf habit, which, without the central fertile fronds, bears a close resemblance to *P. heterophylla*; these lower fronds are, however, equally fructiferous with the taller ones, and are ovate in outline, tripartitely divided, with oblong bluntish segments, sericeous along both sides nearly to the apex. The taller fronds are a foot high or more, twice the height of the others just described, with a long thickish angular stipes, the lamina bipinnately cut into narrow linear distant decurrent fertile lobes, sericeous throughout. The segments are from 1 to 1½ inch long, and about an inch apart, the terminal one longer, and those at the top of the frond simple; these fronds therefore have quite a different aspect from the shorter ones. It was found growing on Orchids imported from the West Indies, and has been raised from spores of the plant thus obtained. It has the appearance of a possible hybrid between *P. heterophylla* and *P. mutilata*; the shorter fronds, however, are constantly fertile in all the plants we have seen, and in this respect, coupled with the production of taller dissimilar fertile fronds, differs from either of the species just named, and from all other known Ferns.

Price 10s. 6d. each.

## PYRETHRUM AUREUM SELAGINOIDES.

This is an entirely new and distinct form of *Pyrethrum*, of an exceedingly dwarf and compact habit, the flat foliage resembling the fronds of *Selaginella Mertensii* overlying each other, which gives the plant a wonderfully pleasing and level appearance.

Its chief attraction, however, will be found in the fact that it does not flower the first year, thus saving the vast amount of time which, in consequence of the constant attention required in pinching back, &c., the old variety consumes—a great object where bedding is carried out on an extensive scale.

Price 3s. 6d. each; 30s. per dozen.

## VALLOTA MAXIMA OCLATA.

This is a grand improvement on the old well-known *Vallota purpurea*; being much stronger in growth, the flowers are much larger, and of greater substance, of a rich crimson-scarlet colour, with a large white eye.

Price 10s. 6d. each.

## DOUBLE-FLOWERED GOLDEN TRICOLOR PELARGONIUM.

MRS. STRANG.—Although we have had some beautiful colours and forms of this fine decorative class of Pelargoniums, this is the first variety with double flowers; the foliage of this is the richest we have seen, and, having fine scarlet flowers, very double, forms a desideratum long wished for, and cannot fail to please.

Price 10s. 6d. each.

## NEW ABUTILONS.

The following seven varieties have been selected from a large number of seedlings; and B. S. W. can confidently recommend them as being superior to anything yet sent out, both in colour, habit, and profuseness.

The Abutilon is one of the most useful decorative plants we have, and can be had in flower all the year round; for cutting purposes there is nothing better.

CHARMER.—A grand acquisition, with bright rosy-crimson flowers of fine shape, dwarf and profuse.

CRIMSON BANNER.—Habit dwarf, compact, very profuse, deep crimson, of fine form.

GOLDEN NUGGET.—Flowers roundish, of fine form and substance, rich orange inside, outside rich orange veined with crimson.

PURITY.—Flowers pure white, an improvement on *Boule de Neige* both as regards size and substance, very profuse.

PURPLE EMPEROR.—Large flowers, good substance, rosy-purple, distinct and pretty.

QUEEN OF THE YELLOWS.—This variety has very large flowers, of fine form and substance, lemon-yellow, very distinct.

VIOLET QUEEN.—Flowers of fine form and substance, of a bright violet colour, very distinct, and quite a new colour amongst Abutilons.

Price 7s. 6d. each.

## NEW CALADIUMS.

The following Caladiums are quite distinct in character to any hitherto offered, and may be considered the origin of a new type. The leaves are generally long and narrow, not so arrow-shaped as the ordinary forms, having a peculiar grotesque appearance.

ADNESCENS.—Leaves from 12 to 15 inches long by 3 to 4 inches broad, bronzy-red veined with crimson, margin pale green, very distinct and fine.

FULGIDUM.—The leaves of this variety are from 6 to 9 inches long by 4 to 6 inches broad, rather oval in shape, centre salmon-rose with rich metallic hue with bright veins, broad margin of pale green.

METALLICUM.—The leaves of this very distinct variety are from 9 to 12 inches long by 3 to 4 inches broad, the centre rose with a bronzy metallic band on each side, the margin pale green and wavy.

PULCHERRIMUM.—Leaves from 9 to 12 inches long by 4 to 6 inches broad, the centre transparent white with a broad margin of green, beautifully spotted; very distinct.

Price 10s. 6d. each.

## NEW GLOXINIAS.

The following set of Gloxinias have been selected from the finest collection that we have ever had the good fortune of choosing from, and will be sure to give general satisfaction. As a Spring decorative plant the *Gloxinia* stands unsurpassed.

ADMIRATION.—The flowers of this variety are drooping, throat deep violet; mouth rich purple shaded with crimson, lobes lavender-purple; extra fine.

AMENA.—Flowers semi-erect, throat pure white, mouth deep lavender-blue, lobes same colour; fine shape.

BERKSHIRE.—The flowers of this variety are drooping, throat pure white, mouth bright rosy-pink, large white lobes. First-class Certificate.

BESSIE.—The flowers of this variety are drooping, throat pure white, mouth slightly shaded with lavender, lobes white; fine form and distinct.

COUNTESS AMELIA.—Flowers semi-erect, upper lobes and throat pure white, the lower lobes faintly marked with rosy-salmon; extra fine. First-class Certificate.

EVATINA.—Semi-erect, throat and mouth pure white, lobes pale lavender-blue, flowers fine substance and very profuse.

INCOMPARABLE.—The flowers of this variety are erect, large, and of fine shape, throat deep crimson-scarlet, spotted at the base, mouth crimson, and white lobes.

MAGPIE.—Flowers semi-erect, throat and lobes white, mouth lavender, running into the lobes; a distinct handsome variety.

MIRABLE.—Flowers semi-erect, deep rosy-purple throat, violet mouth and lobes, margin pale lilac, splendid shape, and large.

PICTURATA.—Flowers drooping, throat light shaded with blue, lower part of the throat rosy-purple; a fine distinct flower.

PULCHERRIMA.—Semi-erect tube, pure white, with pale lavender mouth, lobes round and smooth, splendid shaped flowers.

SELECTA.—Flowers erect, tube, throat, and mouth bright salmon-red, with a broad margin of white, large, and good shape.

Price 7s. 6d. each.

## NEW PELARGONIUMS.

GENERAL ROBERTS.—This is a very distinct variety; flowers pale salmon, fine shape and free flowering. A splendid pot plant.

LORD MIDDLETON.—This variety has not been tried for bedding, but its free-branching habit is a pretty safe guarantee; but for pots as a winter decorative plant it has no equal. Flowers bright purplish-crimson, and fine majestic trusses.

MR. WADDS.—This is named after the best grower of this class of plants that we have met with. Any one going to Birdsell during the autumn and winter months will have a treat. It is of medium growth, very free flowering, colour bright orange-scarlet, fine shape.

MRS. BURNS.—The flowers of this variety are bright pink, with a white eye, good shape, and compact free-branching habit, profuse blooming. This will become a general bedding plant.

MRS. INGRAM.—This charming variety is of medium growth, producing an abundance of well-formed trusses of deep rosy-pink flowers, shaded violet, white buds in the upper petals.

MRS. TAYLOR.—Close compact habit of growth, and dark mottled leaves, producing fine trusses of flowers well above the foliage, pure white, with a salmon centre.

Price 7s. 6d. each.

NEW ILLUSTRATED PLANT CATALOGUE NOW READY, POST-FREE TO ALL APPLICANTS.

VICTORIA AND PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

CALCEOLARIA.

The best varieties only. Price 2s. 6d. and 5s. per packet, post-free.

SUTTON AND SONS, The Queen's Seedsmen, Reading.

Special Cheap Offer of Good Plants.

All for Exhibition or Garden Decoration, and fine named varieties of our selection.

PANSIES, PINKS, PHLOXES and DAHLIAS, 3s. per dozen, 20s. per 100, or 12 of each for 11s. CHRYSANTHEMUMS, FUCHSIAS, COLEUS, SALVIAS, 2s. 6d. per dozen, 15s. per 100, or 12 of each for 9s. LOBELIAS and AGERATUMS, best sorts, from store-pots, 1s. per dozen, 4s. per 100.

CATALOGUES of all Indoor and Outdoor Plants for the largest or smallest Gardens, Conservatories, &c. Very comprehensive. Prices very reasonable. Plants true to name. WM. CLIBRAN AND SON, Oldfield Nursery, Altrincham.

GIANT ASPARAGUS PLANTS, the best that money can procure, all certain to grow. 2s. 6d. per 100. This delicious vegetable does not require half the expense usually incurred in planting it. See Richard Smith & Co.'s Seed List for 1880.

RICHARD SMITH AND CO., Nurserymen, Worcester.

F. AND A. SMITH'S BALSAMS.—Seed of the above can be had from most Seedsmen throughout the world, in 1s and 2s. packets mixed, and in 2s. 6d. collections of nine colours. Also Cineraria, Primula, and Calceolaria, in 1s., 2s. 6d., and 5s. packets, or direct from F. AND A. SMITH, West Dulwich, S.E.

New Japanese Azalea.

AZALEA ROSÆFLORA.—This beautiful species, which is now offered for the first time, differs from every other Azalea in cultivation. The flowers in the bud resemble those of a miniature Tea Rose, whilst as they expand they regularly imbricate like those of a Camellia. These qualities, combined with the fact that it does not fall off, render it invaluable for coat flowers, bouquets, as well as for exhibition and general decorative purposes. It is compact and free in growth, and much branched; colour deep rosy-red.

First size, 6 inches high, some in flower, 10s. 6d. Second size, 6 to 9 inches high, some in flower, 21s. Third size, 1 foot high, many in flower, 31s. 6d.

WM. HUGH GOWER (Manager to the late Wm. Rollisson & Son), The Nurseries, Tooting, S.W.

New Catalogue for 1880.

WM. CLIBRAN AND SON, The Oldfield Nurseries, Altrincham, Cheshire, will have great pleasure in sending their DESCRIPTIVE PRICED LIST on application. Their stock of Florists' Flowers, Bedding and Soft-wooded Plants generally, is surpassed by none either in extent or quality, all the newest and best varieties being constantly added to the various classes, and the greatest care is taken to keep the varieties true to name. Another great advantage to purchasers is that none of the Plants offered are taken from a warm propagating-house and sent off immediately, but are all carefully hardened, and most of them potted off singly, and are thereby fitted for transit by post or rail without the slightest injury. A great proportion of the under-mentioned are autumn-struck plants, and can be had in pots if required, and all in a variety of sorts and colours, all good for exhibition or home decoration.—

Table with two columns: 'Our Selection. Per doz.—s. d.' and 'Our Selection. Per doz.—s. d.'. Lists various plants like Abutilons, Achimenes, Ageratum, Begonias, Bouvardias, Caladiums, etc., with prices.

SELECT INDEX OF PLANTS

The Publisher of the Gardeners' Chronicle recommends Subscribers who wish to have extra Copies of the Numbers containing the

SELECT INDEX of PLANTS from 1841 to THE END of 1878,

TO SECURE THEM AT ONCE.

The following is a List of those already published:—

Table showing publication dates: 1879.—October 11, 25, November 8, 15; 1879.—November 29, December 13; 1880.—January 10, 24; 1880.—February 7, March 20, 27, April 3.

Price 5d. each, post-free 5½d.

W. RICHARDS, 41, WELLINGTON STREET, STRAND, W.C.

NEW YELLOW FRENCH MARGUERITE, CHRYSANTHEMUM ETOILE D'OR.

Awarded a First-class Certificate by the Floral Committee of the Royal Horticultural Society on the 13th inst.

A splendid Conservatory Plant, blooming profusely all the year; flowers excellent for cutting.

Equally adapted for Bedding in the Flower Garden in Summer.

Now being sent out, 24s. and 36s. per dozen.

W. HOWARD, FLORIST, SOUTHGATE, LONDON, N.

Orders to be accompanied by a Cheque or Post-office Order.

CHOICE PELARGONIUMS FOR SPRING, 1880.

PELARGONIUM VOLUNTE NATIONAL.

I have great pleasure in recommending this beautiful decorative Pelargonium, as being one of the most distinct, free flowering, and best habited plants ever sent out. As a Decorative Plant, or for Cut Flowers, it is invaluable.

Awarded a First-class Certificate by Royal Horticultural Society, July 8, 1879.

Price, 3s. 6d. each, Strong Flowering Plants. 2s. 6d. each, Small Plants—Free by Post.

Coloured Plates free to Customers when one dozen and upwards are ordered.

Pelargonium Lucie Lemoine. Pelargonium Madame Charles Konig.

Both of these varieties are pure white, of great substance, free and continuous bloomers. Will be very valuable for Cut Flowers.

2s. 6d. each.

SEMI-DOUBLE-FLOWERED PELARGONIUMS.

ALBA PERFECTA.—Pure white flowers, very dwarf and free flowering. Will prove one of the very best white bedders, as the flowers have no shade of pink in them.

EMILE DE GERARDIN.—Soft bright rose-pink, very dwarf and free flowering.

LA NUBIEN.—Deep fiery crimson, very free flowering.

The above three semi-doubles are very distinct, and quite new in colour, and will be invaluable to cut from—in fact, would make a lovely bouquet by themselves.

Plants 2s. 6d. each. Usual Trade Price.

ONE PLANT of EACH, PACKAGE or POST-FREE, for 12s. 6d.

POST-OFFICE ORDERS TO

FREDERICK PERKINS, NURSERYMAN, 37, REGENT STREET, LEAMINGTON.

# ANTHURIUM ANDREANUM.

---

MR. J. C. STEVENS has received instructions from Mr. F. SANDER to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, May 5, at half-past 12 o'Clock precisely, a splendid importation of

## ANTHURIUM ANDREANUM,

Collected and brought home by Mr. F. C. Lehmann.

The plants are in splendid growing condition, with healthy leaves and growths. This grand species far surpasses in beauty the well-known *Anthurium Scherzerianum*, its colours being more vivid, and the size of the flowers immense. The plant was described in the *Gardeners' Chronicle*, April 10, p. 464, and it says, "This time a plant which attracted all eyes was *Anthurium Andreanum*." And again it is fully described and figured in the *Gardeners' Chronicle*, April 17, p. 490, which states:—"This is the very striking plant which we noticed last week as having been exhibited at Ghent, where it attracted much interest; a similar feeling was experienced here when the plant was shown before the Floral Committee of the Royal Horticultural Society. The plant is an Aroid of tufted habit, with oblong, cordate, glabrous, leathery leaves, dark green above, paler beneath, and marked by comparatively few but prominent nerves; the leaf-stalks are ascending, cylindrically slender, and thickened at the top, the blade being attached, as it were, hinge-wise, so as to allow of varying positions, deflexed or spreading. The flower-stalk is double the length of the leaf-stalk."

Undoubtedly the plant is one of the most brilliant and remarkable discoveries of recent times. Those who remember what *Anthurium Scherzerianum* was on its first introduction, and what it is now, are justified in looking forward to the career of the present plant as of quite exceptional importance. This is fully borne out by the statements of Mr. Lehmann. The flower lasts in beauty four months, its colour is most brilliant, and the plant is of easy cultivation. It grows at an elevation of from 3500 to 4200 feet, and a temperature of from 60° to 70° would suit it best.

At the same time will be sold a splendid importation of the rose-coloured variety of *ODONTOGLOSSUM VEXILLARIUM*, the grand new blue-flowering *PESCATOREI LEHMANNI*, and *ODONTOGLOSSUM ALEXANDRÆ LEHMANNI*; also various other ORCHIDS, together with a splendid lot of the Burmah variety of *VANDA CÆRULEA*, collected by Mr. Freeman.

FLOWERS AND DRAWINGS ON DAY OF SALE.

*May be viewed the morning of Sale, and Catalogues had.*

---

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

Lawn Mowers — Lawn Mowers.

THE GREAT SUPERIORITY OF  
**GREEN'S PATENT "SILENS MESSOR"**  
AND  
**"MONARCH" LAWN MOWERS**

Over those of all other Makers is universally acknowledged. They will Cut Either Short or Long Grass, Bents, &c., Wet or Dry.

These advantages no other Lawn Mowers possess. They have been in constant use for upwards of twenty years in

- The Royal Gardens, Windsor,**  
Fuckingham Palace Gardens  
Marlborough House Gardens  
Royal Horticultural Society's Gardens, South Kensington  
The Royal Botanic Gardens, Regent's Park  
The Crystal Palace Company's Gardens, Sydenham  
The Winter Palace Gardens, Dublin

An effectual and speedy Eradicator of Scale, Thrips, Green Fly, Mealy Bug, Red Spider, American Blight, and all Parasites affecting Plants, without injury to Foliage.

It may be used with perfect safety and efficiency for the Destruction of Gooseberry Caterpillars.

Especially adapted for the Destruction of Blight on the Coffee Plant.

The Proprietors have great pleasure in bringing to the notice of Horticulturists generally this valuable preparation, the basis of which is Nicotine, or the Oil of Tobacco, with which is blended other essential ingredients, to render it available as a general INSECTICIDE.

It has now undergone a thorough test by some of the most practical men in Horticulture, and it is proved beyond all doubt that no Insecticide will bear comparison to it for killing properties with Perfect Safety to Foliage.

It may be used as a Dip or Wash for any description of out or indoor Plants, and as a Dressing for the Bark of Fruit Trees, Vines, &c., it has no equal.

The following is a fair sample of Testimonials, selected from some hundreds lately received from men of considerable experience—

Messrs. J. & J. HAYES, Nurserymen, Edmonton, London, N., on Feb. 9, 1880, write:—

"We consider your Nicotine Soap a great boon to all who have anything to do with plants or fruit growing, as it is so very useful for dipping and syringing when it is not convenient to fumigate. You are quite at liberty to make what use you please of this."

Messrs. OSBORN & SON, The Fulham Nurseries, London, write:—

"We have given your Nicotine Soap a fair trial, and our experience confirms the character you give it, that it is an unrivalled preparation for killing insect life, without injury to plants."

Mr. B. MALLER, Burnt Ash Nursery, Lee, London, S.E., on Feb. 21, 1880, writes:—

"I have given your Nicotine Soap a fair trial, and I must now say it is very satisfactory. I am now having it used freely for syringing 1/2 pint to 4 gallons of water, without the least injury to the foliage."

Mr. J. C. SYVERS, Orchid Grower to Sir Trevor Lawrence, Bt., Burford Lodge, Dorking, on Nov. 24, 1879, writes:—  
"I have now tried in many ways your Nicotine Soap as an insecticide for Orchids, and it has given me great satisfaction," &c.

Messrs. BARNWELL & TILBURY, Nurserymen, Worthing, on March 19, 1880, write:—

"Having used Corry & Soper's Nicotine Soap this year, we can with pleasure say it is the most useful insecticide that has ever come under our notice. We have tried it on Strawberry plants when in bloom, and find it most effectual in destroying the fly, whilst it does not in the least injure the plants or flowers, but gives a better and healthier growth to the plants."

Mr. GEORGE ABBEY, Gardener to C. M. Palmer, Esq., M.P., Greville Park Garden, Saltburn-by-the-Sea, on February 20, 1880, writes:—

"The Nicotine Soap I had from you I find a safe and powerful insecticide, being destructive of every kind of insect infesting plants, and in no instance has any injury been done to the foliage. At a strength of 3 oz. to a gallon of water, I have used it for syringing Peaches during growth for the destruction of red-spider, without injury in any way (only to the insect!—which it instantly kills). At that strength to 4 oz. to the gallon it may, with perfect safety, be employed for syringing every description of fruit tree, whether under glass or outdoor, and a majority of plants, without the least injury, whilst at the same time it destroys aphides—green, brown, blue, and black—thrips, and red-spider. At a strength of 6 to 8 oz. to a gallon of water, I have employed it very successfully for destroying mealy-bug, brown and white scale, both by syringing the plants and applying with a brush, its effects upon the insects making its application gratifying; whilst from its grateful smell, it is pleasant than otherwise. At a strength of 8 oz. to the gallon I found it a first-rate winter dressing for fruit trees, mealy-bug on Vines, as well as a destroyer and preventive of red-spider, thrips, and aphides. It also destroys American blight."

The following Nurserymen authorise us to say they have used the Nicotine Soap with unqualified satisfaction:—

- J. Laing & Co., Forest Hill, London, S.E.; Hawkins & Bennett, Twickenham, S.W.; G. Edwards, Balham, S.E.; James Walton, Lee, S.E.; D. S. Thomson, Wimbledon, Surrey; F. & A. Smith, Dulwich, S.E.; J. Peed & Son, Roupell Park, Lower Norwood, S.E.; G. Brand, Wynchmore Hill, N.; Hooper & Co., Covent Garden, W.C.; Lucombe, Pince & Co., Exeter; Edwin Cooling, Derby; T. Frost & Sons, Maidstone; W. C. Drummond, Bath; G. & W. Yates, Manchester; W. Bryant, Rugby; J. Stewart & Son, Dundee; J. Cocker & Son, Aberdeen; J. Charlton, Tunbridge Wells; Edmonson Bros., Dame Street, Dublin, &c.

Sold in jars, 8 oz., price 1s. 6d.; 20 oz., price 3s.; and in tins, 14 lb., price 15s. 6d.; and drums, 28 lb., price 25s.; 56 lb., price 50s.; 112 lb., 95s. Full directions for use on each package.

And 2 oz. sample jars, 6d. each. Full directions for use on each package.

THE  
**Gardeners' Chronicle.**

SATURDAY, MAY 1, 1880.

KIDNEY BEANS: DWARFS AND RUNNERS.

WHAT we term French Beans—the Haricot Bean of the French—are not of French extraction, but come from Phaseolus vulgaris, a native of India, which is mentioned as being in common cultivation in England in the year 1597. Phillip Miller, of Chelsea, in the edition of his *Gardeners' Dictionary* published in 1731, devotes a good space to the genus Phaseolus, and states that it takes its name from a Greek word meaning "a long swift ship," because the husk of the fruit or pod resembles such a ship. His description of the general characteristics of Phaseolus is well worthy of being reproduced. "It is a plant with a papilionaceous flower, out of whose empalement rises the pointal, which afterwards becomes a long pod pregnant with seeds, for the most part shaped like a kidney, or oval; to these notes may be added leaves growing by threes on each pedicel, and the plant for the most part climbing." Miller enumerates several species as cultivated for their flowers or as curiosities, and then mentions three sorts of Kidney Beans cultivated for the table in England, viz., the common white or Dutch Kidney Bean—the White Case-knife, or White Dutch Runners of the seed lists of the present day; the lesser garden Kidney Bean, commonly called the Battersea Bean, answering to our dwarf French varieties; and the Upright, or Tree Kidney Bean, which would appear to be the same as our modern Scarlet Runner. Concerning the Dutch Bean, Miller states it was formerly more cultivated in England than at the time he was writing (150 years ago), but it was the chief sort grown in Holland, from whence, probably, it had the name of Dutch Kidney Bean. He alludes to it as a tall-growing variety, rising "to a very great height," requiring to be supported by tall stakes, which trouble rendered it difficult to cultivate the sort in plenty; "and the Beans being much broader than the small sort renders them less valuable in the London markets, which, I suppose, occasioned their being neglected in England." The dwarf type was preferred in many gardens then as now, because "the plant never rambles too far, but is always of moderate growth, so that the air can pass between the rows and keep them from rotting; it is also a plentiful bearer, and the best Bean of all the rest for eating." In these days the Scarlet Runner is generally regarded as the best flavoured Bean, though Miller thought they did not eat so firm and crisp as the commonly cultivated dwarf Beans.

The Scarlet Runner was introduced from South America in the year 1633, at a time when the question of the royal privilege in England was shaping itself into that form which eventually brought Charles I. to the scaffold. It is supposed that the scarlet variety, which grows

so tall and is so prolific, was first cultivated about that time by Tradescant, the celebrated gardener at Lambeth. It was then, we are told, in so great repute for its flowers that they formed the leading ornament in the nosegays of the ladies; and it seems to have kept its place only as an ornamental plant for nearly a hundred years, as its legumes were seldom used as an edible substance until brought into notice by Miller of Chelsea in the eighteenth century.

It is difficult to discover any reliable information as to the origin of and the times when the leading varieties of the dwarf French or Kidney Beans were introduced to commerce. The earliest seed catalogue I can put my hand on—that of James Carter, 238, High Holborn, published in 1842—simply states, "Kidney Beans, dwarfs and runners, in sets;" and this practice of cataloguing appears to have been common at that time. In Messrs. Peter Lawson & Sons' seed list published in 1852 there is a list of varieties of dwarf Kidney Beans, and the Dun, Negro, Canterbury, Fulmer's Early, and Wilmot's Early, appear in this list. As far back as 1836 I find that the light or Early Dun, and the dark or liver-coloured Dun, were mentioned as early varieties, very hardy and productive; the dwarf Negro, or Black Kidney Bean, "as much esteemed both in this country and the Continent for its green pods," an opinion quite as freely held at this distance of time—nearly half a century; and the Negro was at that time very much used for food by the black population in the Brazils. The dwarf Canterbury, with its small clear white seed, was then as now a well-known dwarf early sort, but rather unproductive in some cases; still it is an esteemed sort for an early crop, the young pods being very tender. Fulmer's Early was also in cultivation then, but Wilmot's Early appears to have been a later introduction; and both these are little grown in our days, except by some of the older school of gardeners.

There are now a great many varieties of dwarf French Beans. The Royal Horticultural Society's trial of dwarf Beans at Chiswick in 1877 included forty-two distinct varieties, many of which were received under almost innumerable synonyms. It is worthy of notice that Kidney Beans are in increased demand every year; and it is believed that the increase, though owing to a great extent to the growth of the population, is also occasioned in part by a greater appreciation of Beans as an article of food.

One of our leading wholesale seed houses states that they get through from 2000 to 3000 bushels of Kidney Beans every year; the demand rising higher as the years roll round. The two most esteemed market Beans are the Early Dun and the Negro, with the Canadian Wonder, Williams' Early Prolific, and Osborn's Forcing also in good demand. The two last-named are improved speckled varieties, and they have proved to be of excellent quality and improved value over many other new introductions during the past few years. Market gardeners are found sticking to the Dun and Negro, because early reliable croppers, quick to turn in, and the earliest to be put in the market. Both the dwarf and long-podded Negro Beans are in great demand; the long-podded Bean of one of the large seed houses is of a peculiar small-seeded stock. The Long-pod Negro is a selection from the old dwarf type. Messrs. Hurst & Son have this season put into commerce a monster Negro Kidney Bean, which is a greatly improved variety, said to rival the Canadian Wonder in length of pod and good quality: it is said to be very early and extremely prolific, and was considered by the Royal Horticultural Society worthy of its First-class Certificate of Merit. The Canadian Wonder French Bean is now grown by almost every gardener, and it is, in consequence, in great demand. A leading wholesale house requires at least 500 bushels every year. Good judges of dwarf Beans assert that the Canadian Wonder is distinct from the Crimson or Scarlet Flageolet of the French, and an older type, viz., Cutbush's Giant Dwarf Bean, though much like

it in the dry state, but has a more erect rather than a spreading growth, and the pods more obtuse at the points. How it originated Mr. Cutbush is unable to say; a few seeds were given to him nearly thirty years ago, and he has grown the stock continuously up to this time.

It may interest some to know that the White Advancer Bean is identical with the White Flageolet; that Best of All is simply a good stock of the old Sion House Forcing and that the old round-seeded China Kidney Bean, which is marked in a very handsome manner, is still a favourite variety: it is also known as the Robin's Egg. It may be stated that the pale Dun and the dwarf Negro are still standard varieties; and that the following may be regarded as acceptable improvements on the sorts generally cultivated, viz., Williams' Dwarf Prolific, Osborn's Forcing, Canadian Wonder, and the Monster Negro.

The wax-podded Beans, both dwarf and runner, introduced a few years ago, with their singular looking yellow pods, though awarded First-class Certificates of Merit, were never better than garden toys in this country. There was a kind of un-English look about them, and they are now in but small demand; while their table quality was no doubt a little overrated. *R. D.*

(To be continued.)

## New Garden Plants.

MASDEVALLIA ROSEA, *Lindl.*

"What is *Masdevallia rosea*?" some of our readers may ask. Well, it is a peculiar type of *Masdevallia*, quite distinct from any species we have, bearing flowers of a length of 11 centimetres. The even sepals are 3 centimetres broad, of the most lovely rich rose-purple, the long tube of an exquisite purple-scarlet. Dr. Lindley sketches it: "flowers pink, 2 inches long, very showy." This glorious thing, so long desired, was saved from the wrecked ship, *Para*, at St. Michael's, Azores, by our friend F. C. Lehmann. The very few plants will appear at Mr. Stevens' rooms, to make their European *début*. We hope to give very soon further details and a woodcut of the queen of *Masdevallias*. *H. G. Rehb. f.*

MASDEVALLIA CHELSONI (VEITCHIANA × AMABILIS).

This is a mule between *Masdevallia amabilis* and *Veitchiana*, just intermediate between the two. The scarlet outer perigone is covered inside with beautiful mauve papillæ, as in the glorious *M. Veitchiana*, but the shape of this part is far nearer to that of *M. amabilis*. The petals are white, with a falcate, much developed process at the base on the anterior side, and a mauve spot at the top. Lip pandurate, mauve at the border, brown at the blunt apex, white on the disk of the inner side, with a mauve line through the middle line beneath. Column white, with an entire border to the androclinium, and a very short mauve streak on each side of the middle border. Leaves with a very long petiolar part.

It is, as far as I know, the first *Masdevallia* raised from seed in Europe, and, moreover, the first mule produced in Europe. This sounds very glorious for the Veitchian establishment. So far it is all bright and shining; but as to myself, I do not delight so much in it. The new thing is very very near *Masdevallia splendida*, and chiefly distinct in the nature of the petals, lip, and column, and by ratiocination. Mr. Davis, who appears to have looked with sharp eyes for *Masdevallias*, gathered *Masdevallia Barleana*, *Davisi*, *Veitchiana*, *spectabilis*, but, as far as I know of, no *amabilis*. Hence *M. spectabilis* cannot be the same, but they are very much like one another at all events, as occurs in the case of the mules of *Gymnadenia nigra*, and *Gymnadenia conopsea* and *odoratissima*. *H. G. Rehb. f.*

## HARDY FLOWERS AT THE ROYAL HORTICULTURAL SOCIETY.

LOVERS of hardy flowers owe their thanks to Mr. Elwes for his numerous contributions to the meetings of the Royal Horticultural Society. Many of the flowers cultivated by him are new to English gardens, or at least are but imperfectly known. Others were favourites a quarter of a century or more ago, but are now seldom seen in cultivation. It was by the persistent devotion of a few old florists that many of the choicest varieties of *Auriculas* and laced *Polyanthuses* were preserved through a long period of comparative neglect. Many beautiful herbaceous and alpine plants have been preserved in the same way, and they will probably be heard of as the demand for them increases. A large proportion of the flowers

grown by Mr. Elwes are cultivated in the open garden; but it is convenient to plant some specimens out in frames, or to grow them in pots, so that they may be sheltered by glass to preserve them from damage by wind or rain. Many such flowers are rather fragile, and the month of April in England seldom passes without dashing rains, or even snow and hail storms, which make sad work with beautiful flowers. Still it is very astonishing how much rough weather many of our hardy spring plants will endure, especially such as succeed well in sheltered nooks of rockwork.

One of the fine old-fashioned flowers which might have been seen years ago in cottage gardens in Scotland, is *Pulmonaria virginica* (*Mertensia*). It grows freely in any garden soil, and the drooping racemes of bright blue flowers are very beautiful at this season.

*Helleborus guttatus* (?) from the Caucasus had eight flowers on a spike; these were 3 inches across, reddish-purple in colour, and densely spotted with purple. It grows 3 feet high, and lasts in flower three months.

*Corydalis bracteata*, a Siberian species of singular beauty, was much admired. It has glaucous green leaves, and the whole plant is not more than 1 foot high, and half the length of the stem is clothed with a dense spike of primrose flowers. It was honoured with a First-class Certificate.

*Streptopus roseus*, though introduced from North America in 1806, is seldom seen. It is not a showy plant, but its numerous small rosy-pink flowers which droop from large branched stems are pretty; the beauty and interest of the plant is continued by a profusion of red berries.

*Arnebia echinoides*, introduced from the Caucasus, was honoured with a Certificate, and described last year. Its dense corymbs of bright yellow flowers, marked with five distinct maroon spots each, are very striking; these spots die off as the flowers get older. This should be grown in every garden if it can be obtained.

*Dieleytra cucullaria*, grown in English gardens for more than a century, attracted considerable notice for its finely divided glaucous green leaves and remarkable white flowers, which have gained for it the name of Dutchman's Breeches. Then we were shown many different species of Tulips, the irregularity of outline of which would cause their rejection by the florist; but they are beautiful exceedingly, as free-born children of Nature, from the small Indian *Tulipa stellata* to the noble *T. Greigii*. I much admired a small unnamed species, with pink flowers, from Teheran. In size and form the flowers are like *T. stellata*; but the base of the flower is rich yellow, more faintly marked outside.

*T. Kolpakowskyana*, under cultivation, had improved immensely in two years; the cultivated flowers were three times as large as those that flowered from the wild bulbs in one year. The flowers are a rich deep crimson-velvet. It is Siberian, and was received by Mr. Elwes from St. Petersburg.

In the collection were several species of *Fritillaria*, and one of the most useful for open-air culture in English gardens is *F. latifolia*; the original species had been received from the Caucasus, but it has been introduced to this country since 1604. In Mr. Ware's nursery at Tottenham several varieties of the species are now in flower. *F. recurva* was shown for the first time at South Kensington probably, but I was disappointed with it. The flowers, five or six on a stem 18 inches high, are scarlet, yellow internally, but densely spotted with reddish-scarlet; the petals reflex, hence its name. There are probably more highly-coloured varieties than this: I hope so.

*Erythronium grandiflorum* had five very beautiful bright primrose flowers on a stem. This is a very distinct hardy plant. Introduced from North America in 1826, it was lost to cultivation until the last few years, but it is well worth looking after for its interest and beauty.

The hardy *Cypripediums* are my favourites amongst hardy plants. There was a beautiful flower of the pretty *C. candidum*. The pure white lip, from which it derives its name, is like polished ivory. *C. pubescens* is well known, and it is one of the easiest to cultivate; the lip of some of the varieties is quite golden.

The above are not half the fine flowers shown by Mr. Elwes—indeed, many of them had to be sent to Kew to be named; but they show the rich variety that can be had in our gardens at this season without the aid of artificial heat. What a wealth of instruction and

pleasure could be derived from cultivating a collection of hardy plants in pots, and placing them in a greenhouse or in a pit reserved for the purpose all through the spring months. We grow numbers of such plants for this purpose at Loxford. To the greater number of our visitors nearly all of them are marvels unknown before; and fresh interest is excited when they are told that all of them are quite hardy in cold frames or in the open ground. *J. Douglas.*

### GYPNUM FOR POTATOS.

THE value of gypsum as a deodoriser and fertiliser appears to have dropped nearly out of sight in this country for many years past. In America, however, it has been, and still is, largely used, particularly for crops of Potatos. Since Benjamin Franklin sprinkled the letters of his name on a field of red Clover by a roadside near Washington, which caused the Clover to grow so much stronger that his name could be read a long distance off, gypsum has been in great favour in America. So much was this the case that many years ago nearly every corn-mill in New York State had a detached shed, or outhouse, in which there was one or more pairs of stones for grinding gypsum. On the Hudson, too, we are informed, there was a large mill built fifty years or so ago for the express purpose of this trade. The source whence gypsum was then obtained was the mines in France, and it used to be shipped in its raw state as ballast in vessels trading between New York and the northern French ports. It was then taken up the Hudson, and in other directions, for grinding for horticultural and agricultural purposes. This foreign trade in gypsum has, however, been greatly reduced, we are informed, by the discovery of gypsum in America.

In England this subject has been recently revived by the discovery of large and valuable seams of gypsum in Sussex. This occurred in 1872, during, or subsequent to, the meeting of the British Association at Brighton in that year. It happened in this wise. An enthusiastic geologist, Professor G. A. Ramsay, held a theory that the Belgian coal bed extended across the Straits of Dover and the English Channel, and was within workable depth from the surface of South Sussex. After the Professor had read a paper on the subject, a subscription was raised for the purpose of boring, with a view to testing the Professor's conclusions. This experiment was carried out in a valley at Netherfield, near Battle; but although a depth of upwards of 1900 feet was reached, no coal seam was struck, and as the size of the boring tools was not adapted for going deeper, the subscription fund at the same time having been exhausted, the project was abandoned. In the interval, however, at a depth of 125 feet, a seam of gypsum of very fine quality, and 7 feet in thickness, was passed through by the boring tools.

The reports of this discovery, as they appeared in the London papers, attracted the attention of Messrs. Bosworth & Ison, of Ashby-de-la-Zouch, who had had much experience in mining for gypsum in Derbyshire, and they went down to Netherfield on an exploring expedition. From what they saw they were satisfied in regard to the great value of the discovery. Whereupon they laid the matter before Mr. J. C. Baxter, of Reigate, a gentleman with large resources and great commercial experience, particularly in organising companies, and in a few days a landowner was treated with, and a private company formed under the title of "The Sub-Wealden Gypsum Company." Of the works we need only say that the best engineering skill has been employed, while every modern appliance of the most approved kind has been adopted. When we visited the works last year, soon after they were in full working order, we found that the company had obtained a siding on the South-Eastern Railway at Robertsbridge; that they had a private railway winding up a valley in a beautiful wood of Oak and Hazel; and when we turned the last curve that there was a chimney-shaft and blocks of buildings which reminded us of the large coal-mines of Durham and Northumberland. As a further proof that much enterprise has been displayed in this business, we may say that the items of the first outlay amounted to upwards of £40,000.

These introductory remarks will, we think, lend an additional interest to this subject.

The manner of applying gypsum to Potatos in America is to drop as much as can be held between

the thumb and finger on the "set" after it has been deposited in a dibbled hole, or on the bottom of a furrow before it is covered up. Then, before it is "hilled" or moulded up, another similar pinch is dropped around the stem or stems of the plant. This dressing is looked upon as acting beneficially in two ways—(1) in assuring the health of the plant, and (2) in increasing, as a natural result, the quantity, quality, and flavour of the tubers.

Potatos generally may be benefited in this country by the same means. Early, or new Potatos, however, are not of so much consequence, as they are eaten in their waxy stage, and at a season before the well-known disease, which has been more or less prevalent since 1846, generally makes its appearance; but for late Potatos, which are liable to the disease above referred to, an experiment with gypsum in all parts of the kingdom may be advantageously carried out. What we would recommend is, that a number of alternate rows of late sorts of Potatos should be dressed with gypsum at the time of planting, after the American plan, as above described. This would be a conclusive experiment to prove whether the rows so dressed were freer from disease, larger in size, and better in quality, than the rows which had only an application of ordinary stable, farmyard, or other manure. We have before us some letters from some well-known growers of seed Potatos, and they say that where gypsum was applied in addition to ordinary manure, the difference in the crop was very marked and highly satisfactory. This cheap experiment is certainly worth an extensive trial.

But there are other uses in horticulture to which it seems gypsum may be put with advantage. It is a well-known fact that vegetables—that is, Cabbages, Broccoli, Savoys, Potatos, and so on—cannot be grown with safety and profit on the same land for more than three or four years at the most. This is because these plants when heavily manured, as they are in the market gardens around London and other large towns, deposit so much free acid by means of their numerous decaying roots, that the soil becomes poisonous to a new crop of similar plants. The result is "anbury," or "fingers-and-toes." The preventive adopted is to grow a crop of some cereal, such as Wheat or Rye. This crop alters the character of the soil in the required way, when vegetables may be again planted with safety for the following three or four years. But as the crop of vegetables and Potatos that can be grown in one year is worth five or six times as much as a cereal crop is at the present time, it is worth while to further experiment with gypsum, to prove whether ten shillings' worth per annum will not keep land cropped with vegetables perfectly healthy for any number of years. From observations we have made, we believe it will. Carbonate of lime, or quicklime, will not do it, as we know, but sulphate of lime, or gypsum, is a very different chemical combination, and we have every reason to believe that its value is almost entirely overlooked by horticulturists and market gardeners.

As to the deodorising capacity of gypsum, it is remarkable that this well-known quality should be so generally neglected. This view applies particularly to suburban market gardeners, with whom straw is always scarce, and the quantity of town manure they use is very expensive, if the carriage be reckoned. If a few tons of gypsum were used per annum for absorbing or fixing the ammonia of their stables and piggeries, the value of tons of the best Peruvian guano might be secured. We now have to pay £14 per ton for guano which contains about the highest known amount of ammonia, yet men's eyes and noses are irritated with the volatile salts in stables, while horses are sometimes blinded by its effect, and this, too, at the same time that gypsum can be obtained in abundance, and at a low price per ton.

The sulphate of gypsum is an essential element of all plants which come under the head of vegetables. To prove this no analysis is required; for when they have been carried long distances, or otherwise been kept a few days till decomposition has partially set in before they are cooked, the nose can readily detect their sulphurous character by the disagreeable odour they emit at the dinner-table. If all these points be taken into account together, too much cannot, in our opinion, be said in favour of gypsum as a deodoriser and fertiliser.

The quality of the Sussex gypsum, which led to the above views, is, as we have intimated, of the finest quality. French and Derbyshire gypsum is ingrained

with a red or rusty substance. This is oxide of iron, which is generally superabundant, and often to an injurious amount, in soils. In gravelly soils it is always superabundant, and often noxious to plants, unless its effect is neutralised by a large deposit of vegetable substances. But, on the contrary, the ingraining of the Sussex gypsum is of a bluish-grey colour. This is carbonate of lime in the form of limestone. Therefore, if the small quantity found in the Sussex gypsum be slowly soluble in soils, it is perfectly harmless when applied, and when it has been made soluble by the action of the roots of plants, it is as valuable a fertiliser as the more soluble carbonate of lime, which is known as chalk. *H. H. G.*

NEW AURICULAS.—The National Auricula Society has been the means of bringing before the public numerous seedling Auriculas which they would not otherwise have seen, and many fanciers who were not able to be present at the exhibition will be pleased to learn that many of those exhibited were of the highest order of merit. Indeed it seems evident that in a very few years the new sorts will displace the old varieties that we have so long clung to so fondly.

First in order is the green-edged class, but any really good varieties contained in it are either difficult to grow, difficult to obtain, or are so inconstant that they are scarcely worth growing at all. For instance, Freedom (Booth) and Champion (Page) have become so debilitated in their constitution that it is almost impossible to get them to grow with sufficient freedom to produce a satisfactory bloom. Colonel Taylor (Leigh) is another celebrated flower, and first-rate when it can be had, but I grow about a dozen plants of it, and had not one good truss this year; Mr. Horner and Mr. Simonite both grow it, but it is seldom exhibited by either of them. Imperator (Litton) is a first-class flower when it can be had at its best, but I have grown it for years and have had nothing but the most wretched flowers. Mr. Pohlman, of Halifax, had it very fine on the 20th, and once before I saw it good. Prince of Greens (Trail) has a pale tube, which sometimes dies off inky; but it has a most beautiful green edge. Anna (Trail) has a bad constitution. As far as one can judge at present Mr. Horner stands highest for *bona fide* seedlings of his own raising in this class. Like the rest of us, he was not able to show what may probably be the best flowers, owing to their not being in good condition. Cyclops (Horner) is certainly a very fine flower, and it has what many in this class lack—a rich yellow tube; the paste is good, the ground colour dark maroon, the edge a good green. Rob Roy (Smith), exhibited by Mr. Richard Dean, was not fully developed, being only a small plant, but it promises well; the tube is yellow, the paste circular and dense, the ground colour black, and the edge rich green. Orion (Horner) is a good flower, but the tube is rather pale, paste good, ground colour almost black, with a rich deep green edge.

In the grey-edged class it cannot be said that any of the flowers exhibited came near George Lightbody (Headly), although some of them are distinct and in advance of most of the others in the class. Rev. F. Tymons (Dean) promises well; it has a rich yellow tube, with almost black ground colour, but rather too much of it, and a pleasing silvery-grey edge. Next in order came a seedling of Mr. Llewelyn's, which was too young to judge fairly of its merits; the paste was rather thin, yet it has a good grey edge, and maroon ground colour; the flowers are also of large size. Thetis (Horner) is a neat flower, rather like George Levick, with a good yellow tube, dark maroon ground colour, and silvery-grey edge.

In the white-edged class there is, I think, as much room for improvement as in the green, and the general public will probably be of the same opinion while a variety like Catherina (Summersdale) stands 1st in its class. Conservative (Douglas) promises well; it has a rich orange tube, which improves with age, the ground colour is black, and the edge not very pure, but broad and well defined. Mrs. Doddwell (Simonite), has a pale yellow tube, the ground colour purplish-red; the edge is rather narrow, white, good, and the flowers very distinct. Neither of these

flowers have the pure white edge of John Simonite, nor the rich black and striking ground of Smiling Beauty.

In the class for selfs some very striking flowers were exhibited, and although we possess some good flowers already, some of the new ones will be sterling acquisitions. Last year Ringdove (Horner) was the best seedling self; it was again exhibited, but not in such good form. Heroine (Horner) must stand highest on the list this year, indeed the judges had to decide between this and Champion for the prize for the best Auricula in the exhibition. All the parts are well balanced, the tube is a good yellow, paste pure and circular, the edge reddish-maroon, and quite round. Mrs. Douglas (Simonite) is probably the best violet self: the flowers are of great substance, segments quite flat, tube rich yellow, paste white, circular, and contrasting well with the rich colour of the edge; as shown it is deeper in colour than Chas. J. Perry, and a better flower. Lord Salisbury (Mellor) is a red or reddish-crimson self, with a good orange tube, the paste is good; we are short of good crimson flowers, and this may be worth growing for its colour, but I was not particularly struck with it.

All the above received prizes in the seedling classes in the order of their names, and First-class Certificates were awarded to all of them except Mr. Lewelyn's seedling, the flowers of which were not sufficiently developed.

In the class for alpines a few good seedlings were exhibited, and two First-class Certificates were awarded. Unique is a very smooth flower, the centre is yellow and quite circular, the edge shaded purplish-maroon. Titian is a very bright flower with gold centre; the edge is reddish-crimson shading to maroon; the whole plant is of a dwarf, neat habit. On the following day Mrs. Ball, alpine, was shown very fine at the Royal Botanic Society's exhibition, and received a First-class Certificate. It is a good shaded edged flower with a gold centre. The above were raised in the Royal Nurseries, Slough.

Before closing I must beg a little space for the Polyanthuses. These were exhibited in very fine condition. It is but seldom that any striking new flowers are exhibited, but on this occasion S. Barlow, Esq., of Stakehill House, Castleton, had a very fine red-ground seedling, far in advance of any variety now in cultivation; indeed there is but one, and that is Lancer (Bullock), a fairly good flower, but Sunrise is quite a crimson flower. The centre is round and, like the edge and division lines, a rich yellow. The pips were not large, but under other circumstances they will probably be as large as Lancer at its best. J. Douglas.

### THE BUCKLAND YEW.

THIS venerable relic, certainly over 1000 years old, has lately been removed from its former resting-place to a quiet home in Buckland Churchyard [a distance of 60 yards]. This "act of vandalism" is not such a serious matter after all, when one considers that a final place of rest more appropriate could not be found for the old Yew tree, than to be with all due reverence deposited in its own burial ground. This was most satisfactorily accomplished on March 1, 1880. This Samson of Yew trees, which has weathered so many wintry storms, and is yet in luxuriant health, has been doomed to speedy and certain death on the authority of no less than two of our leading professors of tree lore! Poor old tree. In accordance with this view, the coroner of Dover kindly offered his services to hold an inquest over the tree; but I could not conscientiously employ him, knowing that in all probability this grandfather of the forest will outlive some generations yet unborn. I am charitable towards a doubting public when I find men who, notwithstanding their high position as public teachers, are so far behind the times as to give proof of their ignorance by speaking or writing with authority on a subject of which they have little or no practical knowledge. In justification of these remarks, which I make with no intention of giving offence, I give a quotation from a letter received by the Vicar of Buckland, in answer to an application for advice about removing this tree: "I thank you for your very interesting letter, and for the opportunity it gives me of protesting against any attempt to injure, much more to transplant, the old Yew, which latter will result in its death. There is no precedent for the successful transplantation of any tree of considerable age or bulk, and to experiment

on such a specimen as that at Buckland Church would be an act of vandalism that would surely be reprobated for as long as the memory of the tree, and the history of Dover lasted." Another eminent professor in dendrology said to me on my return from Dover that I was "a real Vandal among trees." To this charge I suppose I must plead guilty, seeing that my knowledge both of the tops and roots of trees, and of their requirements for successful culture, and in several instances for their identification, have caused me to be called upon to use my grub-axe to uproot the prejudices and opinions of those who have been opposed to my rough practice. It would be more to the credit of scientific men when asked their advice on practical matters to say, "Really I do not feel competent to advise you on this question; you had better apply to — to do so," than to dogmatically assert what they do not understand.

For the benefit of such as are troubled with short memories, or wanting in practical information, allow me to say that, instead of there being "no precedent for the successful transplantation of any tree of considerable age or bulk," as aforesaid asserted, the gentlemen who recently obtained the City of London

this vault all the roots on that side had been cut for a distance of 8 feet. As soon as I saw the vault I told the Vicar at once the sole cause of the main trunk being laid horizontal, viz., that we should find that large roots which had been the mainstay to support and keep the stem upright had been sawn off. This I found to be the case as soon as the brickwork was removed.

The removal of the large block of soil, the massive and weighty trunk, and heavy branches of this gigantic tree, was, with the great experience which I have had in former years, comparatively an easy task compared with the great difficulty of supporting and carrying in their horizontal position the main trunk and the two enormous limbs, extending south and west, with their extended branches, over 33 feet, as seen in fig. 97. Fig. 98 shows the tree supported in its horizontal position on a large timber-dray on four long balks of timber. This dray, with its heavy load of limbs and branches, was made to move simultaneously with the main trunk, with its upright limb, and mass of soil containing the brick vault and the whole of the roots. The entire block of soil and roots removed measured as follows:—Length, 16 feet 5 inches by 15 feet 8 inches, by 3 feet 6½ inches deep,

FIG. 97.—THE BUCKLAND YEW BEFORE ITS REMOVAL.

appointment as Superintendent of the Epping Forest, and who carried out the planting of the Thames Embankment, gave his evidence on oath in the Court of Queen's Bench some years ago, that he had examined two large Cedars of Lebanon which I transplanted in Surrey, one in the third week of July and the other in the first week of August, both then in active growth, and that two years after they were transplanted, he found them both growing and in perfect health. One was over 50 tons, and the other over 60 tons in weight. Both trees were about 50 feet high; the largest was removed with a mass of soil undisturbed which measured 18 feet long, 15 feet 6 inches wide, and 3 feet 7½ inches deep. The circumference of the trunk was 11 feet 6 inches, and the branches measured across 50 feet. Large old Yew trees, from 300 to 800 years old, have been removed many miles on my transplanting machines to Elvaston Castle and other places more than thirty years ago.

The Buckland Yew had originally a double trunk, which divided a few feet above-ground; the larger of the two had been thrown down (not struck by lightning, as erroneously stated, but) by an "act of vandalism," which was allowed to be perpetrated some 150 or 200 years ago, as follows:—A brick vault had been built close to the trunk of the old tree on the south side, and in excavating for

together with eight large balks of timber. Many planks were used to hold the soil together, it being very friable—a mixture of chalk and sand. The circumference of the main trunk is 22 feet; do., upright trunk, 6 feet 10 inches; do., second horizontal trunk, 10 feet 10 inches; do., south limb, forking off at 9 feet from main trunk, 7 feet 10 inches; do., west limb, forking off at 9 feet from main trunk, 8 feet 8 inches; extent of branches from centre of main trunk southwards, 30 feet 10 inches; and from north to south, 48 feet; they extend from main trunk westward 33 feet. The entire mass removed was 56 tons.

In placing the tree in its present position, by preparing the ground on a slope two ways and by leaving one balk of timber under, I was enabled to cant the horizontal trunk and limbs to nearly the same angle as the limb, which was formerly upright; and by so doing the fine mass of foliage now presents a uniformity of outline which could never have been accomplished by any other means. The Vicar has written me as follows:—"The tree, by universal consent, looks far grander than it has ever done before, and when the grass grows will be a beautiful object."

This remarkable tree is of the male sex, with a most extraordinary exception, viz., a small solitary female branch. In the whole course of my experience I only know one other example of a similar kind,

which still exists in the original Golden Yew which I planted at Elvaston Castle more than forty years ago. When I mentioned this singular freak of Nature to the late Sir William Jackson Hooker, then in charge of the Kew Gardens, and whom I knew when Professor of Botany at the Glasgow University, he told me that he had never known another instance of the kind. From this branch, several years ago, I obtained a very superior breed to the elegantissima var., that being only a cross with a green and golden variety.

Before concluding, I take this opportunity of thanking most cordially the Vicar and his lady for their extreme kindness, and also my other Dover friends, who seemed to vie with each other in rendering us every help in their power in supplying us with such necessary appliances as were requisite to be obtained on the spot. The motive-power used was obtained by the aid of crabs, pulley-blocks, and powerful screw-jacks. *William Barron, Elvaston.*

[We have laid ourselves open to Mr. Barron's rebuke by our comment on this proceeding at p. 305 of our present volume, where we spoke of it as an "act of sacrilege;" and even after Mr. Barron's explanation we are not disposed to alter our opinion as

three yokes. There is the arable land of one team. In demesne there is one. And three villans [tenant-farmers] with two bordars [labourers], have half a team. Eight slaves there. In the time of King Edward, it was worth four pounds. And afterwards three pounds. And now seventy shillings." It will be a matter of surprise to hear of slaves in the time of the Conqueror, but, as the Editor points out, the condition of these *servi* was not worse than that of many an agricultural labourer in our own times. In another entry relating to "Bochelard" the church is specifically mentioned, but not the Yew. Hasted relates, that "in the reign of Edward III. Agnes Barrie was seized of this manor and 42 acres of pasture of the King, by the service of paying one red Rose yearly to the King." We should like to know what that Rose was like! Reverting to the Yew which has led to these remarks, we may mention that, in 1833, the Rev. W. T. Bree published in *London's Magazine of Natural History* an account of this Yew, to which he applies the quotation—

"A noble wreck in ruinous perfection."

Mr. Bree's paper is accompanied by a woodcut illustration, so different from those we now publish, that

dead wood, viz., one on the inner part of the northern limb, hollow and forming a sort of tunnel or chimney; the other on the western limb more solid and exhibiting the grain of the wood, singularly gnarled and contorted. These, which I have ventured to call portions of the original trunk and arms, are partly encased, as it were, on the outside by living wood of more recent growth. . . . The trunk is decayed and hollow at the bottom, but from within the shell there arise two or more vigorous detached portions of small diameter, which soon unite to the main wood, and run up to a considerable height, lapping into one another, twisting and interlacing in a very striking manner, so as to suggest the idea that the trunk has been ripped open, and is now exposing to view its very entrails." Mr. Bree goes on to reprobate the wanton spoliation and injury to which the tree was subjected in his day. "Many considerable boughs, which must have trailed almost on the ground, have lately, it seems, been lopped off in the fine spirit of modern vandalism." EDS.]

## Foreign Correspondence.

FROM NAPLES TO MALTA.—The steamer which took me from Naples to Malta stopped the greater part of a day at Messina, but owing to heavy rain I had hardly three hours for botanising.

The hills rise immediately from the beach, and the town is built on their lower slopes. Being formed of very loose material, irregularly stratified sand and gravel, they are scored by the rains into deep ravines, whose steeply sloping banks meet in sharp ridges above. Following the dry torrent bed at the bottom of one of these ravines, I left the town behind, and found myself among Orange groves mixed with Olives and Peach trees, the latter just coming into blossom. The prevalent flowers were *Fedia cornucopiae* and *Linaria reflexa* upon walls and banks, *Silene colorata* and *Senecio leucanthemifolia* covering more level spots, mixed with a variety of small Leguminosae—*Medicago*, *Ornithopus*, *Lotus*, &c., of common South Italian species. *Bellis annua* was usual in sunny places, *B. sylvestris* in more shady ones. *Parietaria lusitanica*, already in flower, grew among the larger masses of the common species. Of shrubs *Anagyris fetida* hung over the damp bed of the stream in full flower, *Calycotome spinosa* was common on dry banks; *Cytisus triflorus*, *Erica mediterranea* and *Arbutus Unedo* formed a thicket in the lower parts of the valley; while higher up stunted Stone Pines and dwarf Rosemary clung to the gravelly conglomerate. The only *Anemone* was *hortensis*, the only Orchid, *Orchis Morio*. *Cyclamen verum* grew among the latest Violets on the shady side of the valley, and a single flower of *Romulea Bulbocodium* represented the whole bulbous flora.

Next day, February 29, during the stay of the steamer at Catania, I found on the north side of the town a very fertile tract of ground covered with gardens and Olive yards. Waste corners were full of *Asphodelus ramosus* and the smaller *A. fistulosus*, both just beginning to flower. *Silene colorata* dyed the ground as at Messina, but its companion there, *Senecio leucanthemifolia*, was absent here, in fact, replaced by the much less common *S. squalida*, so well known as growing far away from its natural habitat, at Oxford and in Devonshire.

As I advanced, this luxuriant vegetation stopped abruptly. On one side of a wall were the vigorous spring green Lupines in flower under the Olives and Peach trees hanging their clouds of pink in the air, on the other side a rugged waste of black cinders. The lava stream, for such it was, though here and there spotted with grey lichens, seemed as bare of everything green as on the day when it flowed down from Etna, almost exactly 500 years ago, in 1381. On closer examination a few patches of vegetable life could be made out, a stunted bush or two of *Spartium*, a few grasses and Spurge, and a single flower, *Arabis Thaliana*; but the general aspect of the lava was one of utter desolation, even heightened by the bright sunshine which had no power over it, while inspiring life in everything else. *Cactus Opuntia* had here and there established itself on the edge of the lava, and its dull masses of uncouthly jointed branches formed, as it were, a natural transition from the barrenness of the lava to the fertility of the adjoining fields.

On the following morning at daylight we entered

FIG. 98.—ON THE JOURNEY.

to that point. That Mr. Barron could, given the proper appliances, move Westminster Abbey itself we do not doubt, but it would be none the less an act of sacrilege to attempt it. Nevertheless, the feat, in the case of this celebrated Yew, has been accomplished with all the skill and care that Mr. Barron's previous work in this department would lead us to expect. But Mr. Barron will not, we presume, deny the risk he has run, and we now await the result, in earnest hope that our fears may prove to have been vain. It would be interesting to have a record of successes and failures in the removal and transplantation of trees of over 50 tons in weight.

We supplement Mr. Barron's account with a few notes on this now doubly famous Yew. There is a tradition that the tree is mentioned in *Domesday Book*, but after diligent search in Hasted's "Kent" and in the Rev. L. B. Larking's magnificent fac-simile and translation of that portion of our national record pertaining to Chent (or Kent), we find no reference to the Yew in question, though *Bochelard* is frequently mentioned. It may be of interest to some of our readers to see the plan upon which this famous record is drawn up. We therefore cite the following passage, relating to the manor in question:—"Osbern holds of the Bishop, *Bochelard*. [The Bishop was Odo of Baieux.] It answers for

it is difficult to understand how they could have been taken from the same tree. Mr. Bree, however, admits that the woodcut he gives is not a faithful portrait. Mr. Bree alludes to the story of the tree being struck by lightning upwards of sixty years ago—he wrote in 1833. This information he obtained from an old inhabitant, who told him that the steeple of the church was demolished at the same time.

It is worth citing Mr. Bree's account of the appearance of the tree nearly fifty years ago, and comparing it with that given by Mr. Barron. "To this catastrophe [the stroke of lightning] no doubt is to be attributed in great measure much of the rude and grotesque appearance which it now presents. At a yard from the ground the butt, which is hollow and on one side extremely tortuous and irregular, protruding its knotted fangs like knees at the height of some feet from the surface, measures 24 feet in circumference. It is split from the bottom into two portions; one of which at the height of about 6 feet again divides naturally into two parts; so that the tree consists of a short squat butt, branching out into three main arms, the whole not exceeding in height, to the extreme top of the branches, more than about 25 or 30 feet. Of what may be regarded as the original branch and arms, but little I conceive now remains alive: two considerable portions, however, are still conspicuous in the state of

the harbour of Valetta. No scene could be more picturesquely beautiful. The massive houses of the town rise in rows above rocky points crowned with bastions and batteries, while the harbour winding far into the land is diversified by side creeks opening into it from various directions. Here there is ample room for all the varied shipping, sail and steam, commercial and warlike, which, even packed in the closest order, would more than fill most other ports. Having landed, I was not long in leaving the town, but soon made the discovery that Malta is no paradise for the botanist. The population is so dense and the cultivation so thorough, that there is very little waste ground, while the white sandstone of which the whole island is composed is too uniform in structure to promise much variety in the vegetation which it supports. The glacis, indeed, which opens out on the land side of the town, was brilliant with great masses of *Chrysanthemum coronarium*, *Silene colorata*, *Diplotaxis ericoides*, &c., but there was nothing that was not quite familiar to an eye accustomed to the South Italian flora. The great enemy of vegetation in Malta is the violence of the winds which blow over the island; consequently, to protect the crops as far as possible, the fields are made small and all surrounded by high walls, often rising to 7 or 8 feet, so that from a distance nothing green can be seen, and the whole island looks like a huge stone quarry. And yet it is really very fertile: enormous crops of Wheat are raised, Maltese Potatoes are famous, and I saw fields of *Hedysarum coronarium*, with the plants over a yard high, and having stems almost stout enough for walking-sticks. Many Oranges and Lemons are also grown, but as the trees are all carefully protected by walls, one may pass from one end of the island to the other without becoming aware of their existence. The only tree, if tree it can be called, is the Carob, *Ceratonia Siliqua*; this forms round masses 10 to 15 feet high with twice that diameter, the branches twisting in every direction and touching the ground all round. Many of these overgrown bushes seem to be of great age, and they are said to bear large crops of the Bean, which is valuable as food for cattle. The feature in the Maltese flora which first strikes the attention is the extraordinary abundance of *Oxalis cernua*, which is found everywhere by the roadside and even as a troublesome weed in the fields. And it is remarkable that the double flowered variety is almost as common as the single. The numerous minute bulbils have so many opportunities of spreading that propagation by seed is superfluous. Among the old quarries I found a tolerably luxuriant spring vegetation, *Lathyrus Aphaca* and *articulatus*, *Lotus purpureus*, *edulis*, and *ornithopodioides*; *Trifolium stellatum* and *nigrescens*, *Arthrolobium scorpioides*, *Astragalus hamosus* and several *Medicagos*, but almost the only plant which could not be reckoned among the common ones of Central and Southern Italy, was *Hippocrepis multisiliquosa*—not as I had previously seen it, a slender weed of 4 or 5 inches, but a stout fodder-plant reaching 1 foot or 1½ foot in height. The Botanical Garden was in a state of the most pitiable poverty and neglect. A recent change however in the holder of the University chair will, it is expected, not be long in making its influence felt here. In the meantime, I could form some idea of the difficulties of gardening in Malta, by seeing small plants of *Magnolia*, *Aucuba*, *Retinospora*, &c., protected from the wind by tall cylinders of basketwork, and even so presenting anything but a thriving appearance. The Governor's garden at Sant Antonio, 3 miles inland, is famous for its Oranges and Lemons. Though it is of no great size, its produce fetches annually from £250 to £300, the average wholesale price of the fruit being about 2*s.* a dozen. A small garden attached to the house was interesting from the size and luxuriance of some of the exotic plants which it contained. *Ficus elastica*, 20 or 25 feet high, with a trunk 8 or 10 inches across; equally large *Erythrina*s; fine plants of *Cycas*; bearing fruit, *Sparmannia africana* and *Polygala capensis*, very luxuriant, and covered with flowers; *Bignonia capensis*, never out of flower; *Bougainvillea*, with its masses of bracts of the most intense purple; above all *Stephanotis floribunda*, covering one side of the house and, as I was assured by the intelligent gardener, Mr. Bonavia, flowering profusely every autumn. And yet the past winter has even at Malta been unusually severe. I noticed that in many situations *Schinus Molle* had suffered almost as much as at Rome, more, however, in all probability, from the wind than from the actual cold.

During my four days' stay in Malta I collected rather more than 100 species, but there was not one among them which is not also found in Italy. A more remarkable point is that I did not find a single bulb of any kind. After the abounding bulb vegetation of an Italian spring—*Crocus*, *Bulbocodium*, *Scilla*, *Muscari*, *Ornithogalum*, &c.—this seems surprising. Neither were there any Orchids. In fact, with the exception of *Asphodelus ramosus* and *Arisarum*, with half a dozen grasses, I found no Monocotyledons at all. It is of course impossible from such a mere glance to form a judgment of a flora, particularly so early in the spring, still the fact remains that out of more than 100 plants only eight were monocotyledonous. *Visitor*.

## Notices of Books.

**Pathologie des Poissons; traité des Maladies des Monstruosités et des Anomalies des Œufs et des Embryons.** Par Michel Girdwoyn. Paris: Rothschild. London: Dulau. (*Diseases of Fish.*)

This is a valuable treatise, handsomely got up and illustrated with eleven large folio plates. The various diseases which attack the egg, the embryo, and the adult fish are briefly described, their causes explained, and the appropriate remedies detailed. So far as we are concerned, the section of most interest is that relating to vegetable parasites. The *Achlya prolifera* is a fungus which attacks only diseased eggs. The only means of preventing the access of this fungus is to keep the water scrupulously pure by removing all diseased fish or dead eggs. The water should be kept in motion, at a temperature of 4° C. above zero, and well aerated.

The *Saprolegnia*, which attacks the young fish, is probably the same fungus as that which attacks the eggs, and its history is well expounded in these columns, together with some excellent woodcuts, by Mr. Worthington Smith, in 1878 (May 4). The section relating to monstrous conditions is treated very meagrely considering how great is the interest of such phenomena. From a practical point of view, however, such monsters are anything but desirable, and hence probably the brevity of the chapter on this subject—a chapter supplemented by numerous valuable illustrations. We recommend the book to those interested in fish culture as an unpretending but valuable treatise, the illustrations to which are especially useful.

**La Pisciculture, par M. Jules Pizzetta, et l'Os-treiculture en France, par M. de Bon.** (*Fish and Oyster Culture.*) Paris: Rothschild. London: Dulau.

This is one of a series of useful little manuals which we owe to the same publisher. The subject is not one which we can treat in detail in these columns, so that we must confine ourselves to the mention of the principal subjects handled in this volume, viz., the history of the subject, the structure of fishes in general, practical fish culture, the collection and fertilisation of eggs, incubation, hatching, treatment of the young fry, dissemination of fish, industrial fish culture, fishing, description of various sea and fresh-water fish, crayfish, and leeches. Oysters are treated in the same manner, and the work ends with an account of the laws made to regulate the fisheries in France. We recommend the book to the attention of those interested in this source of wealth and pleasure.

— *On the Frost of December, 1879, over the British Isles.* By Wm. Marriott.—It is evident that the weather of 1879 will not lack for historians. The tale they have to tell is, for the most part, uniform, though as to plants there seems to be considerable variation. In Berwickshire, at Blackadder, the thermometer on December 4 fell to -23°, 23' below zero, a statement almost incredible, but one that is sufficiently verified. Peach trees were killed to the roots, Cherry Laurels, Portugal Laurels, Rhododendrons, many Hollies, Wellingtonias, Araucarias, Deodars all killed. At Portpatrick -20° were registered. The only comparatively mild districts were the West and South of Ireland and the extreme South-west of England. The documents we have cited will be studied with interest in connection with the records of the effects on plants which will not be fully visible till summer is well advanced.

## Garden Operations.

### FLOWER GARDEN, ETC.

**FLOWERING TREES AND SHRUBS.**—Whether it be the long dreary winter through which we have passed that has given one a keener relish for the beautiful in the vegetable world, or whether it be attributable to previous *nonchalance* in the matter, certain it is that to me these have never appeared so beautiful as they are this season, and the enjoyment of them has led to the determination to increase their number as soon as the planting season again comes round. I have made especial note of the double-flowered Gorse (*Ulex europæa flore-pleno*), the Almond (*Amygdalus sibirica*), the flowering Currant (*Ribes sanguineum*), the wild Cherry (*Cerasus Avium*), and *Berberis dulcis*. These are all now in fine flower, and will very shortly be succeeded by *Laburnums*, *Lilacs*, *Hawthorns*, and several other species, which, if planted in large numbers, either in clumps by themselves or singly on the lawn, or as standards in beds of Rhododendrons and other evergreens, might appropriately be designated as but the development of spring flower gardening, unaccompanied with any of the anxiety and labour of spring flower gardening in the ordinary acceptation of that term. At any rate, it will be generally conceded that of recent years the planting of such kinds of shrubs and other deciduous trees has been neglected by reason of the many new introductions amongst evergreens and Conifers—fashion, unfortunately, having domination in gardening as in most other matters.

**HARDY FERNERY AND ROCK GARDEN.**—Remove all dead fronds and the winter's mulching; give additional soil to all that require that assistance; and any that have yet to be planted should be done forthwith. In planting well consolidate the soil about the roots, and, till they are established, artificial watering will be necessary. If the soil has been brought from ground in which the common Bracken (*Pteris aquilina*) has been growing, care will be requisite to pick out every particle of root, or it will soon smother the weaker-growing Ferns; and the same remark will apply to Couch-grass, which usually abounds in such soils. In the rock garden some of the earlier flowering plants, such as *Arabis alba* and *Saxifraga crassifolia*, should, for neatness' sake, have their old flower-stems cut off, and seedling weeds be checked in growth by breaking the bare spaces of soil with a handfork. As a rule, formal edgings to walks in such gardens are undesirable and out of place, but where such must be had, *Sedum glaucum* is about the most appropriate plant for the purpose I have ever seen used. It looks best planted about 4 inches wide. *Aubrieta Campbellii*, *Omphalodes verna*, *Myosotis dissitiflora*, *Anemone apennina*, and *Alyssum saxatile*, are among the most showy of the plants now in bloom, and are of the easiest culture.

**ANNUALS AND BIENNIALS.**—Thin out seedlings of these that were sown in the open ground, and guard them from slugs by dustings of fresh lime, or by laying down small patches of bran, which they soon find out, and late at night, or in early morning, may be caught in the act of purloining the same. Prick out in frames, or sheltered spots in the garden, Wallflowers, Asters, Stocks, Everlastings, Sweet Williams, Sweet Sultan, &c. Make another sowing of Mignonette and Sweet Peas; stake those that were first sown, and also stick Carnations, Pyrethrums, *Dielytras*, Peonies, and all similar plants that require such supports. The pressure of work is now so great that such little jobs as these are apt to get put off till too late, and so the plants suffer.

**BEDDING PLANTS.**—Where spring bedding is not practised, the beds being vacant, several of the hardier kinds of summer bedding plants may be at once planted. Pansies, *Violas*, *Gnaphalium lanatum*, *Calceolarias*, and *Verbenas*, may all be safely transferred to permanent quarters. A slight protection for the three last mentioned kinds may be requisite, such as that afforded by Yew, or other evergreen spray. *Lobelias*, *Petunias*, and *Ageratums* may be planted out in turf-pits, and covered up nightly. This plan sets pots and boxes at liberty, and saves an immensity of labour in watering. *Pelargoniums*, too, ought now to be got out, and be placed in a convenient sheltered spot, where if needed some slight protection may be applied. The space thus afforded will admit of *Iresine*, *Coleus*, and other tender kinds being potted off, and grown on as rapidly as possible consistent with sturdiness; for growth is so slow when first planted that to obtain immediate effect they should be planted closely together. Propagation of these may still go on, such late struck plants being the best for working out geometrical designs, for which purpose also there should be plenty of *Pyrethrum Golden Feather*—one of the most accommodating of plants—which, if sown thinly in hand-lights, or even on a warm border in the open, gives no further trouble. One is sometimes

apt to wish that it was more difficult to raise, seeing that in so many gardens it is the supreme plant, imparting to the garden, when used in such profusion, an air of vulgarity, and effectually proving that it is possible to have "too much of a good thing." *W. Wildsmith, Heckfield.*

#### HARDY FRUIT GARDEN.

So far as can be seen into the future at present, the prospects of a crop of hardy fruit remain unchanged from what they were a fortnight ago. Upon the whole, however, growth has been slow—not vigorous, but hardy looking and healthy. This satisfactory condition is entirely owing to the steady dry atmosphere of the past month. A few warm showers accompanied by bright sunshine would have excited the trees into full action, and propelled the rising sap to flow in streams into the perpendicular branches. A period of cold and drought succeeding such conditions would then have brought black and greenfly in shoals, which, owing to the softness of the growth, would have been difficult to checkmate effectually. All these troubles are so far saved, and the sap in the trees having been set in motion slowly and regularly, and the young growths being unusually hardy, the prevention of the attacks of insects will be all the more easily accomplished.

CHERRIES occupying south situations have set abundantly, but there are already symptoms that large quantities will turn yellow and drop. The protection is now reduced to a very scanty covering of fishing-net, which will be kept on a little longer until the young leaves outgrow the softness which was rendered unavoidable by covering. It is quite as important to shield the young shoots of fruit trees, especially those that have been lately basking under cover of thick fir-boughs and other similar materials, as it is to shelter the blossoms. The latter are fed by the former, and the young fruits can only progress according to the health in which the vital power of supply is kept up. Standard Cherries, Pears, Plums, and Apples now in full flower should be well provided for by having an abundance of netting, tiffany, or branches ready should a sudden change occur.

The pinching and disbudding of APRICOTS, PEACHES, and NECTARINES will have to be undertaken vigorously before the shoots grow too long or get overcrowded. Apricots are likely to be very scarce upon open walls, and when growth gets into full swing there will be some difficulty in keeping the trees in a state of fertility for next year. When trees are bearing a full crop of fruit the young growths are usually of moderate size and regular; lacking this timely pinching and disbudding is the best remedy. Allowing shoots to grow 1 foot long or more and then removing them is not the way to conserve strength or infuse vigour into weakly branches. In order therefore to retain an equal proportion of vigour in all parts of a tree the base must always be kept right by encouraging clean healthy shoots from the very base of the branches produced from the leader and another from the extremity of the same shoot. Any number of intervening shoots may be pinched and made into fruiting spurs, but anything approaching overcrowding is but a useless waste of vigour that by timely attention may be diverted into weaker channels by which a fair equilibrium is struck in the motion of the sap, and shoots of moderate and equal size are distributed all over the tree. When green or black fly are discovered no effort should be spared to dislodge them upon their first appearance, by using any of the insecticides so frequently recommended. A solution of soft-soap diluted in water, at the rate of 4 oz. to the gallon, is the only insecticide except paraffin that is used here. Choose a fine afternoon for the operation, and do it sufficiently early to allow the foliage to get dry before dark if the nights are at all cold. *W. Hinds, Canford.*

#### FRUIT HOUSES.

MELONS.—For the flowering, setting, swelling off and maturation of early Melons the seasonable weather with which we have been favoured during the past couple of months has been everything that could be desired. Owing, therefore, to these favourable circumstances, the fruits are ripening somewhat earlier than usual (we cut our first fruit on the 22d ult.) this season—an event of no small importance in a desert-forming point of view at a time of year when other choice hothouse fruits are comparatively scarce. Under these circumstances—reiterating my remarks in last Melon Calendar—it will be necessary, absolutely necessary, to maintain a drier and more airy atmosphere in houses in which the fruits are ripe and ripening, in order to ensure good-flavoured fruit. Hence the advisability of leaving a little air on at night, inasmuch as pent-up air is antagonistic to the high flavouring and colouring of fruit in general—a fact well-known to all practical gardeners. Maintain a night temperature of 70°, and put a little air on at 75° in successional houses, and add thereto as the temperature increases and until it has reached 85° or 90°, reducing it as the decline of the sun's power or

other circumstances require it, finally shutting up at from 3 to half-past 3 on bright afternoons, with plenty of atmospheric moisture in the houses. Add some more soil to the hillocks as the roots push through the sides of the mounds, which must be repeated at intervals, i.e., as the roots push through the soil, until the allotted space is filled. In no case allow young plants intended for planting to become pot-bound before being so planted, for by so doing they become stunted and rarely make a kindly growth afterwards. Therefore, under these circumstances, should young plants be likely to get pot-bound before the pits and frames for which they are intended are ready, they should be shifted into pots a couple of sizes larger than those in which they are at present growing. *H. W. Ward, Longford Castle.*

#### FIGS.

The fruit in the early house, which is as a rule furnished from trees in large pots, is now ripening very fast, and on this account the supply of moisture will have to be reduced, while ventilation may be increased. Great care and judgment will have to be exercised in the management of the trees, as, owing to the fact that they are laden with fruit in every stage of growth, the daily routine must meet the wants of the succession as well as the ripening crop. In our own early house the pots, which are now surrounded with a mass of new roots embedded in virgin soil, receive plentiful supplies of warm water, the surface of the plunging material and the lower parts of the trees are regularly syringed, and the whole of the trees are well washed overhead immediately after the ripe fruit has been closely gathered. This occasional washing assists in restoring the exhausted energies of the trees, keeps them free from red-spider, and at the same time keeps the succession crop moving forward. Fire-heat is of course necessary, and a few of the strongest lateral growths require stopping and tying aside, as good Figs cannot be obtained without a free circulation of warm air, and exposure of the fruit to sun and light. Although the nights have been very cold throughout the past month, the days have been bright and bracing, and under these favourable conditions succession crops have made rapid progress. If not already stopped and tied down, no time should be lost in getting this done, as the fruit will soon begin to show signs of swelling for ripening, and if, as is often the case in succession houses, the trees have set a very heavy crop, a general thinning should be made as the work proceeds. To suppose that a tree, be it Fig, Peach, or any other kind of fruit, is more likely to mature a crop, by being oppressed with a load that would suffice for two is a great mistake, and yet we often see the Fig above all other fruits treated in this way, the result being certain loss of quality, and very often the loss of the entire crop of fruit. The general routine in the succession houses is good root feeding with tepid liquid, or clear water, through a heavy mulching, plenty of heat, air, and a good syringing twice a day—the first time when the temperature is beginning to rise, and again in the afternoon after closing with sun-heat that will raise it to 85° or 90°. Get pot trees intended for next year's forcing well advanced, in order that they may have a long and complete rest before they are wanted. By constant stopping and feeding young plants may be kept growing for a considerable time, and they soon make large trees; but size is gained at the expense of fruitfulness, and on this account a small tree thoroughly ripened and rested is more portable, prolific, and profitable. *W. Coleman, Eastnor Castle Gardens.*

#### RIDGE CUCUMBERS.

For these we make a trench as long as may be required, 5 feet wide and 18 inches deep, which we fill with long stable dung and leaves—principally the latter—mixed together, and raised about 2 feet higher than the surface, the whole being well trodden as the work proceeds, after which it is covered with the ordinary garden soil. Then we make mounds at 5 feet apart upon the centre of the ridge of prepared soil, on which we place handlights, they having been previously washed, into which our Cucumber vines are planted, and the soil pressed firmly about them. After which they are shaded for a few days during bright sunshine until they have established themselves, and are covered up at night with mats. On bright afternoons the plants should be damped with tepid water and the lights put on. *H. W. Ward, Longford Castle.*

#### PLANT HOUSES.

STOVES.—Except in extensive gardening establishments, it often occurs that the whole collection of stove plants has to be grown in one house without any compartments or divisions, and where this is the case it is a difficult matter to treat the several subjects according to their requirements, for although the heat and atmospheric conditions may suit very well, shade is a necessity to some, while others need the greater part of the sunlight we get at this season. Among those that enjoy, or are improved in the colour of their foliage by the solar rays, are the

Crotons and Dracaenas, the leaves of which are brightened by more exposure than they generally get, and the same may be said of Caladiums, which are much stiffened and strengthened in the same way, and when of thicker texture they stand better, and are consequently far more useful for table and other decorative purposes to which they may be put. In arranging these plants and others of a like character, they should therefore be so placed as to have as favoured a position as possible, and if elevated on inverted pots with their heads above others, they will do much to break up and relieve the uniformity of the surface, and be a great attraction to the eye by affording something pleasing for it to rest on. Now that growth is active, it is an important matter, when closing for the afternoon, to see that the pathways are well damped down, and a thorough syringing with clear tepid-water given, and the same again early in the morning of bright days, which, with a proper amount of root moisture, will go far to ward off thrips, red spider, and other insects.

What aids to generate these pests more than anything else is the allowing the pipes to be hot during the day, which brings about such a rapid displacement of the air within as to cause it to become parched, a state that is highly inimical to the tender foliage, as may readily be seen by its flagged and distressed appearance under such circumstances. The fires should therefore be stopped dead back till 2 o'clock or so, and then started briskly, to assist in raising the temperature, which, as night closes, ought to be allowed to fall again gradually till in the morning it stands at something like 70°, a degree of heat quite enough for the present. Young stock for winter blooming will soon do best in pits that are deep enough to hold a little fermenting material, in which plunged they may be kept much more uniform in regard to moisture at the roots, and the vapour arising from the dung, leaves, or tan is very congenial to the plants, which always luxuriate when it is present. Gardenias are particularly fond of it, and as these are generally troublesome among others where they cannot be repeatedly seen to and got at to arrest the progress of mealy-bug, I would advise their being at once put into quarters of this kind by themselves, where, with an occasional application of paraffin, in the proportion of a wineglassful to 4 gallons of water, and heavy syringings daily, these pests may be eradicated. By growing Gardenias in this way during the summer, with little or no shade, and resting them in the autumn by cool treatment, the young wood ripens up well, and produces flowers in great quantities at a time when they are of most value for cutting.

There are few stoves that do not contain at least one or two of that most useful and quaint-looking of all plants, Anthurium Scherzerianum, which from the exceedingly thick texture of its leaves and great substance of its flowers, is quite capable just now of withstanding a lower temperature than it gets in those structures, and although it may suffer in an ordinary greenhouse with air playing on it, it will be quite safe in a room, where, stood in a window recess with a Spiraea on each side its scarlet blooms show up to the greatest advantage, and last a long time in perfection. Scarcely, if at all inferior to the above-named for similar work and for general decorative purposes during the summer, is the Scutellaria Mocinana, the flower-heads of which are most striking in the rich contrast of colour they afford, and any one not having plants of this Skullcap should get it and start cuttings, which in moist heat root quickly, and if potted on soon make neat little specimens. Being very subject to red-spider it is necessary to syringe the leaves freely to keep them clean, but if grown in a moist frame, with the aid of fermenting material, along with Balsams and such-like things, the marauders alluded to seldom infest them. Light soil, such as a mixture of peat and loam, or the latter and leaf-mould, suits this Scutellaria best, which, when it begins to bloom, is much benefited by liquid manure.

It is high time that Poinsettias were cut back and gently started by placing them where they can be damped overhead, which will cause the buds to swell, when a little water may be given to plump them up previous to shaking them out of the old earth and repotting in fresh soil. The tops pruned off may be used for propagating, as, made into lengths with a couple of eyes, and inserted in sharp sand in strong heat under a bell-glass or other cover to keep them close, they strike readily, and make strong shoots, that bear finer bracts than the old plants, as do also those that are taken off with a heel after they start, and get about 2 or 3 inches long. Many growers prefer these, but in the hands of amateurs less skilled the others will be found to give the least trouble. Gesneras, too, so useful for the winter, ought now to be set to work by picking out all the strongest tubers and laying them in pans of moist leaf-mould, to be placed in a Melon frame; by-and-by they can be potted singly, and brought on as required. Should the stock of Achimenes be short, the tops of any taken off and inserted thinly will root soon and flower well in the autumn, as will also Gloxinias raised now from seed. *J. Sheppard, Woolverstone Park.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	May 3	Sale of Established and Imported Orchids, at the Auction Mart, by Protheroe & Morris.
TUESDAY,	May 4	
WEDNESDAY,	May 5	Sale at the Mart of a House and Garden at Ventnor, by Debenham & Tewson.
THURSDAY,	May 6	Sale of Imported Orchids, at Stevens' Rooms.
FRIDAY,	May 7	Meeting of the Linnean Society, at 8 P.M.
		Sale of 499 lots of Natural History Specimens, at Stevens' Rooms.
		Sale of the valuable Library of the late Mr. Waterhouse, at Stevens' Rooms.

IT is quite time that our horticulturists followed the example of their Belgian friends, and bestirred themselves to protest against the stupid and futile regulations enacted by some foreign Governments, and, we regret to add, some British colonies, in reference to the PHYLLOXERA. The object is, of course, praiseworthy, but in seeking to avoid one evil the Governments in question are quite gratuitously inflicting others. It may be quite necessary to enact stringent regulations in the case of Vines, and of plants coming from districts known to be infested with Phylloxera; but, on the other hand, it is quite certain that in those countries where Phylloxera has already got a footing—as in France, Switzerland, Italy—no fiscal enactments will prevent its spread. Again, it is well known that the insect will live only on Vines. What greater absurdity can be perpetrated than that of the Italian Government, which prohibited the introduction from Borneo of tubers of the gigantic Aroid mentioned in our columns last year, or than that which quite recently prevented Professor BALFOUR from landing at Brindisi a case full of succulents, Stapelias, &c., from Socotra!

We have already published the text of the Convention so far as regards Portugal, Germany, France, Servia, and Switzerland; Italy, Spain, and Austria have not ratified the Convention, because, as it appears, its terms are not strong enough to satisfy their exigencies. It is clear that these measures may prove the absolute ruin of some traders and some branches of horticulture, as well as most detrimental to science. If this were necessary we could only acquiesce, but it is, as we have often pointed out, not only unnecessary but futile; and therefore it is incumbent on those concerned to take action in the matter without delay, unless they wish to be stricken with paralysis. Of course no one would complain of any reasonable precautions, it is only of those whose absurdity has been again and again pointed out that we have any ground of complaint.

Representations have been made to our Horticultural Society through its Scientific Committee, who in this matter are discharging a duty which their knowledge and position impose on them, but they must be backed up by all those interested in the transit and introduction of plants.

It may be well to add that those States above-mentioned which have ratified the Convention, permit the introduction of cut flowers (such as botanical specimens), kitchen-garden produce, seeds, and fruits; but plants, trees, and other products of gardens, conservatories, &c., can only be admitted under certain irksome regulations, through certain appointed channels, and under conditions fatal to the life of many plants, if not of all. In the case of those States which have not ratified the Convention, of which Italy and Spain may be mentioned as the most important, it would seem that living plants, or parts of plants, may be arbitrarily prevented

from access or transit. The necessity for action is great, and it is immediate.

— CHRYSANTHEMUM FRUTESCENS ETOILE D'OR (fig. 99). — MR. HOWARD, of Southgate, has recently shown some nice plants of this new variety, showing how effective it is for conservatory decoration or for bedding purposes in summer. It blooms freely when of a small size, so that it promises to be one of our most useful decorative plants for general purposes. The plant is a seedling from the well-known Chrysanthemum (Pyrethrum) frutescens, so much in favour with the French, but the flowers are as a rule considerably larger and of a pale sulphur-yellow. It is said to have been raised by the late M. Nicholas Desgeorges, a gardener at Golfe Juan, near Cannes. His widow disposed of the plant to M. Nabonnaud, nurseryman, of Golfe Juan, by whom it was "sent out" (see *Gardeners' Chronicle*, vol. xii., 1879, p. 594, and vol. xiii., 1880, pp. 242 and 308). The species from which it is supposed to have originated, *C. frutescens*, is a native of the Canary Islands, and was introduced as long ago as 1699.

— HERBACEOUS CALCEOLARIAS. — MR. CANNELL sends us a quantity of cut flowers of a remarkably good strain of herbaceous Calceolaria, in which the flowers are not only very varied in colour, the majority being prettily spotted; but they are also large in size and well rounded in form, and thus represent a strain that may be highly commended for its quality. With them came huge bunches of his winter crop of Zonal Pelargonium flowers, as brilliant and effective as they have been throughout the winter shows and meetings at South Kensington.

— HERBARIUM, KEW. — We are requested by the Civil Service Commission to notify that an open competitive examination for the situation of second assistant in the Herbarium, Royal Gardens, Kew, will be held on May 25 and following days. The examination will include handwriting, orthography, elementary arithmetic, elements of systematic and structural botany, naming of plants by the British Flora. Further particulars may be obtained on application to the Secretary, Civil Service Commission, London, S.W.

— THE AROIDS, as a group, have not hitherto had many special workers in this country, though abroad several important and finely illustrated monographs have appeared relating to them. It is with the more pleasure, then, that we record the first instalment of the labours of Mr. N. E. BROWN, of the Kew Herbarium, in a valuable contribution on some new Aroideæ, with observations on other known forms, read at the last meeting of the Linnean Society (April 15). Of new species several interesting Bornean forms collected by Mr. BURBIDGE and others are described. While in general following Professor ENGLER, Mr. BROWN has nevertheless given preference to the classification of SCHOTT as being the most natural arrangement. Mr. BROWN's drawings and dissections show most accurate painstaking work, and it is to be hoped by its continuance the riches of our Kew collection may elucidate many points in the history of the Aroids which have escaped the notice of our less favourably circumstanced Continental botanists.

— FRUIT PRIZES. — At the last Court of the Worshipful Company of Fruiterers a prize of £10 10s., to be awarded for fruit, was placed at the disposal of the Royal Botanic Society. This prize will be competed for at the exhibition in the Society's garden, Regent's Park, on June 16.

— BAILLON'S "HISTOIRE DES PLANTES." — This ambitious publication has recently been advanced a step, by the issue of a part containing monographs of the genera of Rubiaceæ (including Cinchonaceæ and Caprifoliaceæ), Valerianaceæ, and Dipsacæ. Whatever may be said as to M. BAILLON's conclusions, there can be but one feeling of astonishment at his patient labour—one feeling of gratitude for the information he has brought together. The typography is good, and the woodcuts excellent as ever. The curious arrest of development, in consequence of which the ovaries of two adjacent flowers remain coherent, is shown to exist in Rubiaceæ, e.g., Morinda, Opercularia, Mitchella, as well as in the more familiarly-known Honeysuckle, Lonicera. The

exalted development of the calyx familiar to gardeners in *Mussaenda* occurs even more markedly in *Cruckshanksia*. Again, while in *Carphalea* and *Phyllo-melia* we have a large development of calyx, in *Valerians* and in some *Rubiaceæ* it is reduced to a minimum. *Canephora* is remarkable for its flattened flower-stalks, within whose cup-like apex the flowers seem to be imbedded. *Adoxa* is placed with hesitation in *Rubiaceæ* next to the *Elders* and *Caprifoliols*. From a practical point of view the plants mentioned in the present part are of peculiar importance, including, as they do, the Coffee, the *Ipecacuanha*, here referred to *Uragoga*, the *Cinchonas*, the *Madders*, the *Valerians*, and many others. As garden plants we have among many others the *Ixoras*, the *Gardenias*, the *Diervillas*, the *Honeysuckles*, the *Laculias*, the *Bouvardias*. With the present part the seventh volume is completed—the first appeared in 1868—comprising the history of nearly seventy families. The history of the gigantic group of *Compositæ* is in preparation.

— BOUGAINVILLEA SPECIOSA. — The grand plant of this splendid Brazilian climber that for years made Swyncombe famous among the Oxford demesnes, has lost much of its original glory, probably owing to age, or some cause over which Mr. DANIELS was unable to exercise control. But the species is still glorious in the neighbourhood, for sixteen years ago Mr. W. H. GOOD, the gardener at Greenlands, Henley-on-Thames, then the residence of Mr. E. MAJORIBANKS, but now that of the Right Hon. W. H. SMITH, M.P., brought from Swyncombe a young plant from the parent, then in the full height of its glory, and planted it out in a rather lofty lean-to house now used for growing Ferns, &c. It was planted in the ground against the inside of the house in one of the warmest spots, and here it flourished and threw out two main stems, which in a few years filled the interior of the roof, and during spring and early summer yielded a rich supply of its exquisitely coloured bracts. So dense was the foliage that it was found necessary to cut away one of the two main stems; the remaining one is like that of a young tree, measuring some 15 or 16 inches in circumference. Mr. GOOD is of opinion that the roots are confined within the house, but the plant flourishes bravely, and though at the present time getting past its best, is yet an object of great and surprising beauty. It deserves a house to itself, for from such a plant as that at Greenlands barrowfuls of the mauve-coloured branches could be cut at one time, so generous is the disposition of this truly magnificent subject.

— FOREST TREES OF NORTH AMERICA. — We have received from Professor SARGENT a preliminary catalogue of the extraordinarily rich tree flora of the United States, which is issued with the object of securing a more complete detailed report on the geographical distribution, botanical characteristics, and economical uses of these plants.

— CYTISUS. — Several specimens of this favourite genus are now in bloom in the Temperate-house at Kew, including *C. affinis*, with oblong-ovate, nearly glabrous leaflets, and long racemes of flowers; *C. Atleanus*, a garden variety, with very small obovate, emarginate, hoary leaflets, and close racemes; *C. canariensis*, with small obovate, slightly downy leaflets, and close racemes; and *C. racemosus*, with long narrow, oblong-ovate, emarginate, slightly hoary leaflets, and long racemes of yellow flowers.

— GALTONIA (HYACINTHUS) CANDICANS. — When the two noble plants known generally as *Hyacinthus candicans* and *H. princeps* were first introduced and were figured and described as *Hyacinths* most people experienced a kind of shock, and though unwilling to express dissent from so experienced a botanist as Mr. BAKER, yet felt that some day or other these two un-*Hyacinth*-like plants would be turned out of the genus and placed in some other or in a new one founded for their reception. The latter course has been followed by M. DECAISNE, who in the last number of the *Flore des Serres* has established the genus *Galtonia* in honour of Mr. FRANCIS GALTON, author of *The Narrative of an Explorer in South Africa*. The species of *Galtonia* differ from those of *Hyacinthus* in habit, the form of the flower, and of the ovary, as well as by the seeds in which the cylindrical embryo occupies the whole length of the perisperm.

— ANTHURIUM ANDREANUM.—We learn from M. ANDRÉ that this striking plant was discovered in the State of Cauca, Colombia (not Choco). In May, 1876, M. ANDRÉ saw the first living specimens, and sent home over forty of them, together with twenty-six other Aroids, a Tillandsia, with blood-red leaves, a Masdevallia with black filiform flower-stems and yellow flowers, some creeping Gesneraceæ with large violet flowers and a red hairy calyx, a Bamboo

excursion, succeeded better than the first, so that M. ANDRÉ had the satisfaction to receive in Paris in May, 1878, three small cases containing the Anthurium, and which, by arrangement with M. LINDEN, were placed in the hands of the latter for distribution. It is desirable to put these facts on record, as many false and exaggerated statements have been made on the subject. Anthurium Andreanum, as we learn from its discoverer, grows as

soil, and that its flowers are of long duration. The largest spathe measured by M. ANDRÉ had a length of 12 centimetres, and although the spadix bore ripe fruits, the colour of the spathe was still brilliant. If hybridisation be attempted, the best chances of success would seem to be to cross the plant with others of the Cardiophyllum section, such as *A. regale*, *magnificum*, *crystallinum*, *leuconeurum*, &c.; but on this point nothing can be advanced with cer-

FIG. 99.—PYRETHRUM ETOILE D'OR. FLOWER, PRIMROSE-YELLOW. (SEE P. 560.)

with silvery pubescence, and many specimens of a gigantic Bromeliad, called provisionally *Puya gigantea*, the flower-stems of which measured 10 metres in height, and which had at a distance the aspect of telegraph posts. These plants filled ten large cases, but arrived in Europe in such bad condition that M. ANDRÉ, hearing of their low state, had no peace till he could revisit the locality where he had obtained such treasures, and make another effort to secure them. This second attempt, made by the Indians who had accompanied M. ANDRÉ on his first

an epiphyte, or on the soil in the midst of mosses and Selaginellas. Its slender reddish brown rhizomes are creeping, and at the node from which the leaves spring the flower-stalks are developed, erect, thrown well up above the leaves, and each bearing a curious and beautiful corrugated brilliant scarlet spathe. The specimen exhibited in London shows that the plant will also assume a tufted habit like that of *A. Scherzerianum*. No doubt cultivation will reveal other peculiarities. In the meantime it may be said that the plant grows in a very rainy district in a warm

tainty, and a cross is even possible with *A. Scherzerianum*, which belongs to a different section.

— ROYAL GARDENS, KEW.—It is pleasant to see the activity displayed in the conduct of this national establishment. A new garden has been laid out expressly for the use of students near the main entrance on Kew Green. As the garden has only been constructed within the last few weeks comparatively little can be done this season, nevertheless a satisfactory beginning has been made. A new staircase

to the principal museum is in course of construction, which will not only afford increased accommodation for access, but additional space for the exhibition of objects. The wood museum has been re-arranged, the more important and instructive objects being brought to the front, while matters of detail are relegated to quarters where they will be available for the use of students. In the T-range great advance has been made in securing small well grown specimens of characteristic plants. There is no reason why botanical specimens should not be well grown as well as others of a more conspicuous character. The old botanic garden style of "leggy" plants of little general interest is gradually being superseded by well grown characteristic plants. The scientific value of the collections is not in the least liable to suffer, as the necessary arrangement for the cultivation and preservation of plants of interest can be made quite consistently with the demands of decorative horticulture. The Palm-stove, with its occupants showing grandeur of form, elegance of outline, and stateliness of aspect, has been improved by the introduction, so to speak, of an undergrowth of noble Aroids and graceful Ferns, while judicious thinning and cutting in has enabled many of the nobler plants to be comparatively isolated. In the Orchid-house the plants are in good health and development. In the Temperate-house the somewhat sombre and massive aspect of the Aracarias, &c., is relieved by brilliant Acacias and lovely Rhododendrons, not to speak of the superb Tree Ferns. A striking effect is produced by the introduction of tall Aralias with tall single stems and long narrow deflexed leaves. In one of the octagons Mr. PEACOCK'S Agaves look well. *A. Regelii macrodonta* is throwing up a noble spike of flowers. *Coprosma lucidum*, a New Zealand shrub, is laden with its orange berries and young flowers.

— ORCHIDS AT MESSRS. VEITCH'S.—The following Orchids are now in flower at Messrs. JAMES VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea. In the Odontoglossum-house 150 spikes of bloom may be seen.

<i>Aerides Fieldingi</i>	<i>Masdevallia Lindem</i>
" <i>rubrum</i>	" <i>ochrolepis</i>
" <i>virens</i>	" <i>peristeria</i>
<i>Anguloa Clowesi</i>	" <i>psittacina</i>
<i>Calanthe Dominii</i> x	" <i>Ventchiana</i>
" <i>veratrifolia</i>	" <i>xanthina</i>
<i>Cattleya amethystina</i>	<i>Odontoglossum Alexandrae</i>
" <i>Mendeli</i>	" <i>Andersonianum</i>
" <i>Mossiae</i>	" <i>Cervantesii</i>
" <i>Regnellii</i>	" <i>cirrosum</i>
" <i>Skinneri</i>	" <i>citrosimum</i>
<i>Cymbidium Lowianum</i>	" <i>cordatum</i>
<i>Cypripedium Argus</i>	" <i>Hallii</i>
" <i>barbatum grandiflorum</i>	" <i>hystrix</i>
" <i>caudatum</i>	" <i>luteo-purpureum</i>
" <i>concolor</i>	" <i>maculatum</i>
" <i>Crossianum</i>	" <i>navium</i>
" <i>Harrisianum</i> x	" <i>majus</i>
" <i>hirtissimum</i>	" <i>nebulosum</i>
" <i>Lawrenceanum</i>	" <i>Pescatorei</i>
" <i>Lowii</i>	" <i>Phalanopsis</i>
" <i>marmorophyllum</i> x	" <i>pulchellum</i>
" <i>Sedenii</i> x	" <i>Roezlii</i>
" <i>selligerum</i> x	"  " <i>album</i>
" <i>spectabile</i>	"  " <i>roseum</i>
" <i>Stonei</i>	"  " <i>triumphans</i>
" <i>vernixium</i> x	"  " <i>vexillarium</i>
" <i>violosum</i>	<i>Oncidium ampliatum</i>
<i>Dendrobium Bensoniae</i>	" <i>concolor</i>
" <i>crystallinum</i>	" <i>concolor maculatum</i>
" <i>Devonianum</i>	" <i>fuscatum</i>
" <i>infundibulum</i>	<i>Oncidium leucociliatum</i>
" <i>Jamesianum</i>	" <i>macranthum</i>
" <i>Japanicum</i>	" <i>Marshalli</i>
" <i>lasioglossum</i>	" <i>prae-textum</i>
" <i>transparens</i>	<i>Phalaenopsis amabilis</i>
" <i>tortile</i>	" <i>grandiflora</i>
<i>Epidendrum cochleatum</i>	" <i>Indemanniana</i>
" <i>erectum</i>	" <i>Parishii</i>
" <i>macrochilum album</i>	" <i>rosea</i>
" <i>syringothyrsus</i>	<i>Restrepia antennifera</i>
" <i>vitellinum majus</i>	" <i>elegans</i>
<i>Huntleya meleagris</i>	" <i>muscaria</i>
<i>Laelia Wolstenholmeae</i>	<i>Saccolabium guttatum</i>
<i>Lycaste Skinneri</i>	" <i>retusum</i>
<i>Masdevallia Backhousiana</i>	<i>Sophonrobes grandiflora</i>
" <i>Harryana</i>	" <i>Trichopila lepidota</i>
" <i>luzea</i>	" <i>Vanda suavis</i>
" <i>ionocharis</i>	" <i>tricolor</i>

— EPIMEDIUM.—Among herbaceous flowers blooming at this season few are more attractive than the species of this genus. Their foliage is at once singular and elegant, the flowers showy, and of a very curious structure, forming apparent, if not real, exceptions to the normal symmetry. Their geographical distribution is interesting, and their relationship to Berberis and Vines, which no one would guess at first sight, is very close. Among species now in bloom at Kew are *E. macranthum*, a Japanese species, with purplish sepals, and long white-spurred petals like those of a Columbine, but spreading horizontally; *E. alpinum*, with orange-yellow flowers; *E. pinnatum*, with racemes of bright yellow flowers;

*E. Musschianum*, with white flowers with small spurs; *E. Perraldianum*, with bright yellow flowers; and *E. erectum*, with white flowers, very like those of *E. Musschianum*, if it be not the same: the names given are those on the tallies. Close by are their near allies, *Podophyllum Emodi*, with its speckled, lobed, peltate leaves and white flowers; *Jellicsonia diphylla*, with its glaucous leaves and flowers of many narrow petals; *Sanguinaria canadensis* and *Podophyllum peltatum*—all flowers which should be cultivated by the lover of spring flowers.

— PEARS.—It is too plainly evident that we shall not have an abundant crop of Pears this year. The moisture and sunlessness of last summer have told more largely and disastrously upon the Pear trees than upon any other standard fruits; there was plenty of wood made, far too much of it to be beneficial, but it was soft and unripened. As a consequence throughout market orchards dead growth of this kind is abundant, and the trees have received a shock that it will take two or three favourable seasons to recover from. Even had this result not followed, the bloom would have been none the less scanty. Fruit-buds were universally lacking, and bloom now is so thin that it is but a mere sprinkling, whilst that which is expanded must be viewed with much distrust, having regard to the nature of the preceding season and the generally lacking maturing power. Of all market Pears the Hesse is one of the hardiest and makes the least wood, but this kind is little better than its neighbours and exhibits but a poverty of blossom. At the best we cannot look for better results than about a one-third average crop. Perhaps that estimate is a sanguine one. Looking at the weakening the trees have received during the past severe winter it is no doubt well that the fruit crop should be a thin one. To carry a full crop and at the same time to recuperate their weakened energies would be too much for the trees, and if a warm summer should enable even the latter need to be accomplished, great good will be done and a solid foundation be laid for the production of valuable crops in years to come.

— ODONTOGLOSSUM VENILLARIUM.—Hundreds of flowers of this lovely Orchid (including the rose-coloured variety) are now expanded and in full beauty at Mr. WILLIAM BULL'S establishment, King's Road, Chelsea. Several very rare Orchids are also in bloom there at present, such as *Odontoglossum hebraicum*, *O. Andersonianum*, *O. crispum violaceum*, *Masdevallia Backhousiana*, *Masdevallia bella*, and many others.

— THE OTTO GAS ENGINE.—A short time since when inspecting the working of the apparatus for producing the electric light at Dr. SIEMENS' garden we were so struck with the utility of this engine for garden or estate purposes where gas can be procured that we deem it a duty to call the attention of those of our readers to whom such a machine may be of service to this very serviceable engine. It may be used for any purpose for which a steam engine is required—for pumping water, sawing, chaff-cutting, and any of the numerous operations carried on in a country establishment. The great advantages it possesses over a steam engine are these:—It can be set to work immediately, it does not require the services of a skilled workman, but can be managed by a garden labourer, after very short instruction; there is no stoking, it is clean, smokeless and comparatively noiseless. What the relative cost of working may be as compared with that of a steam-engine of the same power we do not know, but from the fact of its being adopted by a large number of business firms all over the country we may assume that financially, as well as on other grounds, these engines possess substantial advantages. In case of fire these engines possess a great advantage over others, inasmuch as they can be set to work at any time without a moment's delay. In general external appearance the engine resembles a small horizontal engine, but the resemblance is only superficial. The cylinder is single acting, open at the front end, and is so arranged that it only completes its cycle of operations once in two complete double strokes. Its method of working is as follows:—The piston in moving forward draws into the cylinder a mixture of air and coal gas, the latter in measured quantity; returning, it compresses this mixture into little more than one-third of its volume, as drawn in at atmospheric pressure; these two operations take up one complete double stroke.

As the piston is ready to commence the next stroke the compressed mixture is ignited, and expanding drives the piston before it, while in the second return stroke the burnt gases are expelled from the cylinder, and the whole made ready to start afresh. Work is actually being done on the piston, therefore, only during one quarter of the time it is in motion, the gearing, as well as the work driven, being carried forward by the fly-wheel during the rest of the time." The engine we saw at work was made by Messrs. CROSSLEY BROTHERS, 116, Queen Victoria Street, E.C.

— BULBOUS PLANTS, &c., AT KEW.—Among others the following species of Tulips may be mentioned as being now in bloom at Kew:—*T. præcox*, *T. elegans*, *T. suaveolens*, *T. altaica*, *T. silvestris*, and *T. Eichleri*. Of Fritillaries, *F. Meleagris*, our common wild species, and its white variety, *F. tenella*, tall and graceful in habit; *F. ruthenica*, *F. messinensis*, *F. involucrata*, a very handsome species; *F. latifolia*, and especially *F. pallidiflora*, with its stout stem and crowded inflorescence of yellowish angular-cylindric bell-shaped flowers. *Helonias bullata*, with its stout stem of pink flowers, reminds one of an Orchid, but its flowers are more like those of a Squill. It is an old friend, as is also the *Uvularia grandiflora*, with its nodding clusters of clear yellow flowers. *Trillium grandiflorum*, with its noble white flowers, is very beautiful. Of Muscaris there are several in bloom, including *Heldreichii*, with globose, indigo-coloured flowers; *Szovitzianum*, with cobalt-blue cylindric flowers; *pallens*, with very small whitish flowers; *botryoides*, with turbinate flowers of a bright cobalt-blue, and of which there is a white variety. *M. neglectus* is a very handsome species, the lower flowers oblong ventricose, contracted at the throat, black-blue, the upper ones paler; the leaves are narrow, linear, and channelled.

— PUBLICATIONS RECEIVED.—*Transactions of the Scottish Arboricultural Society.—Science Gossip.—Cape Argus.—Catalogue of Forest Trees of North America.—Time.—Mats and Floor Coverings.—Agricultural Students' Gazette.—The Potato Disease, and How to Prevent it*, by FREDERICK BRAVENDER. — *The Cobham Journals*, edited by E. A. ORMEKOD (Stanford).

— THE WEATHER.—General remarks on the weather during the week ending April 26, issued by the Meteorological Office, London:—The weather during this period has been generally fine and bright; thunderstorms, however, were experienced at some of our inland stations either on the 21st or 25th, and very heavy rains occurred in Ireland and Scotland on the 21st. The temperature was equal to the mean in "Scotland, E.," "England, N.E.," and "England, E.," but a little below it in all other districts. The highest of the maxima (66° at Oxford and Nottingham) were registered on the 20th, and the lowest of the maxima either on the 23d or 26th. The rainfall was considerably more than the mean in Ireland and Scotland, equal to the mean in the north-west and north-east of England, and less than the mean value in all other places. "Bright sunshine" shows a marked increase, and the number of hours shows considerable uniformity over the kingdom. The sun was observed the least in "England, S.W.," and most in "Scotland, E.," where the number of hours during which it could be seen was only about a third of the time it was above the horizon. The wind was south-westerly during the first two days, westerly or west-north-westerly on the 22d, 23d, and 24th, and northerly during the remainder of the period. In force it was generally moderate or fresh, but on the 21st the south-westerly wind blew strongly, or with the force of a gale, on all except our south-east coasts.

— GARDENING APPOINTMENTS.—Mr. BRANDER, late principal foreman to Mr. JAMESON, gardener to the Earl of CRAWFORD at Haigh Hall, Wigan, and for the last twelve months gardener at Skene House, has been appointed gardener to the Earl of FYFE, Duff House, Aberdeenshire, in room of the deceased Mr. MACKIE.—Mr. JOSEPH MOIR, late foreman at Dunect, Aberdeenshire, has been appointed gardener to Mrs. CHRISTER, Brooklands, Bromfield, Essex.—Mr. JAMES SMITH, of the Gardens, Highfield, near Leek, has been appointed head gardener to Mrs. RICHARDSON, King's Standing, Burton-on-Trent.

### Home Correspondence.

**The Grape Louse.**—The Phylloxera of the Vine (for there are other species) lives only on the Vine, either on the roots, or (as a form) in galls on the leaves. To prohibit the importation, or exportation, as the case may be, of all living plants, is, to my mind, simply giving way to panic without judgment, and judgment is generally at a discount when panic arises. As to the earth about living plants, it could be suspicious only if taken from an infected vineyard or vinery. A far more serious matter, especially concerning inter-European infection, and I think overlooked in all restrictive or prohibitive enactments, is that of the earth-ballast commonly carried by ships. This is discharged at some loading port. Supposing—for the sake of argument—a vessel in ballast from Marseilles to an Italian port obtained that ballast from some infected district, there would be more danger of direct importation of Phylloxera than in any amount of plants sent out by horticulturists. *R. McLachlan, F.R.S.*

British horticulturists will have learned from the editorial article in the *Gardeners' Chronicle* for April 24, that a Convention has been signed by the representatives of Germany, Austria, Switzerland, Italy, France, Spain, and Portugal, having for its object the prevention of the spread of the Phylloxera in their respective States. Of these States, the Governments of Italy and Spain prohibit absolutely the introduction of any plants whatever into those countries. An equally rigorous exclusion is in force in Austria. Among the restrictive conditions included in the articles agreed upon by the other high contracting parties are some that cannot fail to act, when enforced, most injuriously against the interest of horticulture in this and other countries, and the note of alarm given by the *Gardeners' Chronicle* has not been sounded a moment too soon. We would particularly direct attention to Article 3, which enacts that "Plants, shrubs, products of gardens, nurseries, conservatories, &c., shall be solidly packed; the roots shall be completely divested of soil." It is evident that this amounts to a virtual prohibition of the entry of all stove and greenhouse plants, as well as hardy evergreen trees and shrubs, &c., coming from countries not included in the Convention. The futility and even the absurdity of such a repressive measure are forcibly set forth in the article above referred to. As regards the interests of horticulture it is wantonly supplementing one tremendous evil with another. Our horticultural brethren in Ghent have already formed a committee charged to watch over and protect by every constitutional means the interests thus seriously threatened. They have memorialised the Belgian Government to avert, or at least to attempt to obtain a modification of those articles of the Convention that menace the most important industry of their ancient town. They appeal to British horticulturists for co-operation. The cause is ours as well as theirs, and no time should be lost in giving a response to the call. Let a committee be formed without delay, and let all willing to support so just a cause send in their names to the Editors of the *Gardeners' Chronicle* at once. Unity is strength; a vigorous and united effort in so urgent a case cannot fail to produce good effects. *James Veitch & Son, Royal Exotic Nursery, Chelsea, April 29.*

Horticulturists, not only in this country but in all those affected by the Convention entered into by Germany, France, Italy, Austria, Spain, and Portugal, excluding the introduction of plants into their countries, owe you a debt of gratitude for bringing the subject before the horticultural public, in your leader of last week—a subject of no slight importance, because its effect will be to paralyse an important industry. One naturally feels regret that wine-growing countries should have been devastated with the Phylloxera, but the regulations adopted, instead of preventing or remedying that evil, unnecessarily create another, for, as you plainly state, the obnoxious regulation can have no effect on the introduction or otherwise of Phylloxera, for the simple reason that that pest will absolutely not live on any other plant than the Vine. You probably have seen that a meeting has been held in Belgium, and a petition presented to the Minister there of Foreign Affairs, with the object of getting the Convention modified or rescinded, and that the Ghent deputies are going to bring the subject before the Belgian Parliament; but my principal object in writing is to ask

if, while other countries are protecting their industries, nothing can be done in this? Cannot the Royal Horticultural Society, that has pioneered horticulture in times past, do something in such an emergency? Will not the Royal Botanic Society come to the aid of a branch of commerce, in other ways is nourishing? Cannot a petition be prepared and presented to our Secretary of State for Foreign Affairs, setting forth the gravity of the case? For a regulation, and one, too, that must be futile in its object, that will paralyse an industry not only in this country but in all countries where it flourishes, should be a subject that concerns any Government. How such a Convention as that alluded to can have been signed without consulting authorities capable of advising on the subject is an enigma; professional horticulturists have a considerable grievance against the powers that have so interfered with their occupation, for nothing was known of this Convention until it suddenly burst upon us, and we cannot now at so short a notice withdraw from the Cordilleras of South America, the jungles of India, or the Valley of the Amazon, our collectors who are exploring and seeking for plants, not for one country, but for all countries; indeed the enterprise in scientific horticulture absolutely requires international commerce for its existence. I do therefore hope that something will be done to avert the calamity that at present threatens horticulture, and shall be glad to see the subject discussed in your columns. If not possible for the Convention to be annulled, the best course to prevent the injury I have named would be to add to the usual form required by the Customs a declaration that the plants exported have not been grown in or near any place where Phylloxera exists. *William Bull, F.L.S., Chelsea.*

**The Winter and the Plants.**—This part of the country is about 100 feet above sea level, with a gently sloping south aspect. Owing to the influence of the sea air we seldom get such low temperatures as recorded by some of your correspondents more inland and further north. This may account for things being less injured here than in other localities; the place being well drained and the soil kindly, all tells in favour of the various things in the grounds here. To begin with Camellias in open border with west aspect, there are four large plants of Double White (plena alba) which have this spring shed all their buds, not retaining one; the leaves are a little browned, but not to such an extent as I expected, and they seem now to be pushing their wood-buds stronger than usual, no doubt owing to their not having bloomed. The largest of the four white ones has a circumference of 30 inches at 6 inches above the ground, is 15 feet high, and as much through; the other three are nearly as large. A plant of the old double red, mottled, in the same border, is nearly or quite as large, has stood the winter without any injury; the leaves are as healthy and dark green as usual; it has bloomed fairly, but the flowers are small, and the sun and wind seem to dry and shrivel them up very quickly. There is in the same border a Lady Hume's Blush, which has suffered more than any of the rest, losing more than half its leaves, and setting no buds. In good seasons it flowers profusely, the blooms being as fine as any under glass. There is a fact worth noticing about two large Camellias a little way from the others, which have been planted seventeen years under the drip of a Silver Fir 50 feet high, which killed the Box edging, planted several times. The Camellias have thriven as well here as elsewhere; the leaves look the picture of health. One of the two is Bealii, the other a large red Anemone-flowered variety. On a south aspect is one, Rosa Mundi, which has not flowered as usual, but it is not much injured; concinna, on same aspect but more shaded, has no bloom, but is not in the least injured. Single plants in the pleasure-ground are a little browned, with no bloom on them. The covered way, which is merely a span glazed coping to the wall, on cast-iron front uprights, with south-east aspect: first is a Double White, with no flowers; next is a large plant of single red, with very few flowers; then there is a fine plant of Lady Hume's Blush, which has not been the least injured: it has flowered well, the blooms cut from it being as fine as usual. Donkelaari, close to the last, is profusely covered with bloom, the flowers being nearly as fine as they were in other seasons. Dunlop's americana has a fair amount of good blooms; Hendersoni is also well-flowered and in good health; Bruceana, a fine plant, with fine healthy foliage and some fine flowers; delicatissima, with a quantity of beautifully imbricated white flowers, which have opened better this spring than usual. The various things injured are Aloysia citriodora, Mandevilla suaveolens, Passiflora cœrulea: these three are killed to the ground; Buddleia globosa has stood with only the points of the shoots killed; Arundo Donax is breaking from the bottom; Bambusa Metake and Pampas-grass are uninjured; a large plant of Chimonanthus fragrans has had no flowers this season, though usually well flowered; Magnolia grandiflora is very much browned on walls—of two standards one

has the points of the shoots killed; large and small plants of Arancaria imbricata have escaped with no injury; Myrtles are not injured so much as in 1867, when they were killed to the ground, as they were again in 1871. The lowest temperature registered here was in January, 1871, 25°; January, 1879, 20°; January, 1880, 18°. *James Menzies, Gr. to W. R. Fryer, Esq., South Lytchett, Poole.*

**Primula Sieboldii.**—Both Mr. Llewelyn and Mr. Douglas amply demonstrated at the recent Auricula show by the admirable examples of these Japan Primulas staged by them that there is in them, beyond all other hardy imported Primroses, the making of very effective and pleasing exhibition plants. The comparative failure to produce examples of other species at a given time that could in any way compare with the Primula Sieboldii may perhaps stimulate the committee of the Auricula Society next year to substitute for the class for species, one for this fine Primrose only, as it is evident that it may be relied upon to produce a really showy and well-filled class at the Auricula season. The comparative abundance of varieties, and the ease with which they can be increased and grown, makes this Primula practically everybody's flower, and another year, no doubt, such a class would produce a large competition. There are one or two things connected with Primula Sieboldii that may be worth stating. First, to ensure good and plenty of blooming crowns, the plants must be kept in a cool shady place during the summer, and a robust leaf-growth encouraged. Poor foliage this summer means small crowns and poor flowers next spring. A little weak manure-water may be given occasionally during the growing season, as, after the bloom is past, the pots are, or should be, very full of roots, and these will freely take up moisture. Second, the best heads of bloom are got from plants that have stood two years in the same pots; for, although feeding in the summer is well, there is an evident liking in the roots for the sides of the pot, and to be crowded suits better than too much room. Seven-inch or 24-sized pots are large enough for all useful purposes, whether for exhibition or the decoration of the conservatory. To keep a stock of plants in pots for two years it is desirable to have duplicate stocks of each, because the plants should be broken up and be re-potted after the second year, or otherwise the excessive crowding of the crowns will result in starvation. My own rule is to break up the strong pots in the autumn, pick out and pot up singly into small 6's all the very strongest crowns, and re-pot the weaker ones in bulk in 24's. In the spring some half-dozen of these single plants blocked into a 24 make a nice head of bloom, and these stand unbroken for a second year, when the bloom is abundant, the heads being all that could be expected in a 7-inch pot. Where this arrangement is continued yearly there is always one-year or two-year pots of plants in bloom. The third thing essential to the production of exhibition specimens is that there should be plenty of light and air to keep the stems firm and erect, and where this is the case little or no support is needed for the blooms. Further, the denser and more robust the foliage, the better is the pot hidden and the ideal of the plant realised. Some very hypercritical persons have charged upon many of these newer Primroses that the colours are too pale or "washy." It is just in the delicacy and refinement of the various tints that so many find their special reasons for liking them; deep and glaring colours are abundant enough in other plants, but these Primulas give tints that are neutral and delicate yet beautiful. Some need more stiffness in the stem, but culture on the one hand, and selection from seedlings of kinds that bear erect flowers will soon remedy those defects. As spring hardy pot plants these Japan Primroses must rank amongst the most charming introductions of recent years. *A. D.*

**Mackaya bella.**—I am glad to see a notice or two in the *Gardeners' Chronicle* again of Mackaya bella; it is a plant which certainly deserves to be better known and more extensively grown. I scarcely know a plant more lovely than it when in full flower planted in a warm greenhouse, or even as a pot plant. The plant here, from which your illustration was taken in May last, has at the present time about a hundred sprays in flower, and more to come, thus showing that it is a very desirable plant. *Charles Green, The Gardens, Pendell Court, Bletchingly.*

**Molinia cœrulea for Paper-making.**—My experience of the Melic grass is, that on clay lands it requires great moisture, but on bog it does not, as it grows best on partially drained bogs. I transplanted some roots on to a bog that had had the entire surface removed, and they are growing well. The expense would be heavy. I think, however, what I did was on too small a scale to judge. I have not been able as yet to get any quantity of good seed, but trials that have been made show that it germinates very slowly. In one case the

seeds were soaked in water for thirty hours, then sown in a pot, but it was exactly one month before they came up. In another case the seeds were sown in flannel and water, and though kept in a warm room it was three weeks before they showed any signs of life. I trust that those who have conducted experiments will give us their experience, and that botanists and others will study the habits of the plant. B. L.

#### The Effect of the Past Winter on Vegetables.

—The account which I recently furnished you with regarding the deaths, and other injuries more or less fatal inflicted upon hardy plants by the unusual and protracted severity of the past winter following close upon the heels of what, to borrow an editorial phrase, can only be called by courtesy a summer, was so slight in comparison to what would be naturally expected, that the slaughter of vegetables and the utter derangement of rotation amongst important culinary crops may seem difficult to account for by those of your readers who are not accustomed to ponder and think over the *pros* and *cons* of vegetable physiology nor to reason logically upon the inevitable effect that certain conditions must have upon succulent vegetation. To the person who observes the work of Nature with a superficial eye, or to the practical man who bases his decision in these matters chiefly upon analogy and reasons by comparison upon what is no more or less than mechanical routine, it may seem difficult to reconcile results in two cases which, according to previous experience, have not differed so widely, but which upon minute inspection are rendered perfectly clear when allowance is made for the divergence of structure between succulent vegetables and hardy plants and shrubs. In the latter case there is the inherent vigour which was consolidated in the structure of the plant during favourable seasons to sustain it, or in the case of temporary injury there is the work of years, it may be, lying latent in the underground channels (the roots) ready to come into full play whenever a favourable reaction sets in. The majority of esculents, however, being of extremely slender calibre, and their roots and leaves being of annual formation, are indisputably hardy or tender according to the proportion of air and sunshine to which they have been exposed during their short period of growth, and according to the aspect in which they have been grown, as also the nature and condition of the soil in which they have been planted. It may be urged that the same thing occurs amongst other plants and shrubs, as indeed it does so far as the growth of a season is concerned, but no further. One of the most striking features of last year's experience with vegetable crops was the caprice or rather the uncertainty of succession. I had personal reasons for exercising more than ordinary caution in regard to sowing crops to come in at particular seasons, yet it is a singular fact that where I did succeed it was more by good luck or accident than anything else, for in not one single case was any crop fit for use at the time it was originally intended for, notwithstanding that the precaution was taken of making two sowings of most things that were considered of importance. We had splendid early Celery, that is to say, that which was sown to come in early was first-rate, whilst the late crop was hardly fit for soups. The autumn crop of Turnips, grown upon a north border, by a mere accident took the place of the winter crop, which was of little use except to supply "tops" (greens) during the past spring. Spinach, which was sown on a rich piece of ground in an open plot running parallel with the west wall, has survived the winter, but the supply was amenablely short all the winter. This position was chosen because the north and west walls prevented the sun from having much effect upon the leaves after severe frosts; perhaps the position saved the crop from being wholly destroyed, as it is now affording abundant supplies, but still the fact remains that there was a dearth for this as for other things last winter, and the question is, are we to benefit by our experience in future? What made last winter so distressingly severe in regard to a supply of vegetables was, that the storm set in so severe in November—a date unusually early of late years—that crops, such as Cauliflowers, that were lost might have been saved, had a continuation of the frost been expected. As it was, most people only expected the frost to last for a night or two, and so little was done until the ground was frozen so hard as to render removal of the plants to where they could be protected beyond the range of the practical. The same thing occurred with roots for forcing, where proper measures were not taken at the commencement to keep the frost from penetrating into the earth, which, although dry, was frozen in a few days as hard as iron. It is probable that after such experience, there will be a display of misdirected anxiety in forwarding crops for the present year, which although they may, as crops, be both abundant and of good quality, would nevertheless cause disappointment in not coming in for use at the proper time. It will therefore be the most prudent course not to

deviate too far from the time of sowing, or the system which has served us best, but to supplement in auxiliary form by strengthening the weak points as indicated by last year's results, in order to avoid a vegetable famine in future. Two sowings and plantings in different situations, give a succession in favourable seasons, and it is seldom that with experience of climate and other circumstances, one or other fails to meet ordinary requirements. The planting of Broccolis and other winter greens amongst summer crops of Potatos, although an economical way of utilising land, has its disadvantages, as the plants are drawn up weakly in a young state, and are never stubby nor strong as they ought to be. It is a mistake to plant a succession of winter crops in damp or backward situations, especially if the soil is rich and the rainfall of the locality heavy. There are plenty of late varieties to choose from amongst the Brassica family, and if these are sown late and grown moderately they will always pay for themselves, and be quite as acceptable at table, if not more so, than overgrown monsters. Spinach we intend to grow upon raised mounds of earth, as well as having a couple of sowings in a dry, open plot, where the leaves will not damp in winter. The result of last year's experience with roots for forcing has been that warmer and drier quarters are provided for Rhubarb and Seakale, and I am not sure that it would not pay if we could afford

of this article can be, and has often been, ascertained by analysis. The average quantity produced per head of the population per diem can be approximately calculated, and hence an approximation to the value of the total quantity produced in Great Britain, or in the whole world for the matter of that, per annum, can be made. Now, say—and I believe we shall be well within the mark when we do so—that at least half of that produced in the United Kingdom is, to put it mildly, wasted; what a vast sum of money the annual value of only this half reaches! I never pass a urinal in a town without thinking of and grieving over the waste constantly going on there—a waste which, except in a very few instances indeed, might be so easily and profitably avoided. That which finds its way to those apologies for or grandchildren of ignorance and stupidity, sewage farms, is not of course quite wasted, but that which finds its way to rivers or dead wells frequently becomes a curse instead of being, as it should be, under enlightened management, a blessing. Mr. Baines mentions the times and seasons when he considers liquid manures may be used with the greatest advantage, and I think I shall not be disagreeing with him much when I say that at no time of the year need any liquid manure be allowed to run to waste for want of places or subjects to which to apply it. In spring and summer when green crops are in full growth these receive

FIG. 100.—IN PORT. (SEE P. 556.)

a sunny border for Asparagus for the earliest forcing also. Growth should be made early, and the leaves should fall and the crowns be well ripened early in the autumn, and this can only be accomplished by choosing a soil that is not over-rich nor heavy, and a warm congenial situation. Dorset.

**Liquid Manure.**—I was glad to see in a recent issue so eminent a horticulturist as Mr. Baines advocating the more general use of liquid manure. The importance of this subject can hardly be over-rated, and it is certain that not a tithe of the attention it both deserves and demands is given to it in this or perhaps any other country. How many gardeners, professional as well as amateur, complain of the scarcity or dearth of manure? What horticultural establishment would not be better for more than it gets? and further, I beg leave to ask, where is the garden or farm in or near to which considerable quantities of liquid as well as perhaps solid manures are not wasted or worse than wasted? I do not now allude to the giving of liquid manure to pot plants, which is to some extent understood and fairly generally acted upon, but to the much more extended application to crops out-of-doors of natural liquid manures, principal in value amongst which, I suppose, no agricultural chemist would deem me wrong in placing human urine; at any rate, it is to the wicked waste of this most valuable fertilising agent that I especially desire to call attention. The average value of a given quantity

great benefit from copious and frequent applications, which must of course be in a sufficiently diluted form; eight or ten times its bulk of water will not too greatly dilute human urine for application to most kinds of plants, though rank-feeding things like most of the Cabbage tribe—Rhubarb, Asparagus, as well as almost all kinds of trees and shrubs, Roses, &c., when once established, will bear it much stronger. To give it often weak is better than giving it seldom and too strong. At all times of the year it may be applied to the surface of soil surrounding and occupied by the roots of trees and shrubs with advantage. The slop-water from dwelling-houses usually contains the urine in a sufficiently diluted form for immediate application, and the soapsuds also contained therein are an additional element of fertility. Thrown on bare land in the winter or at other times when no crop occupies it the fertilising properties are absorbed by and left in the land while the water sinks away filtered and purified to the springs. Heaps of cinder ashes, wood ashes, charcoal, charred vegetable refuse, heaps of old leaves, hedge clippings, weeds, and garden sweepings, &c., are all rendered excellent and powerful manures by having slop water or even undiluted urine thrown over them. No one should grumble at the scarcity of manure while ample supplies, often ready to hand, are so utterly neglected, as is so frequently the case. I emphatically assert, and am prepared to maintain, that until agricultural and horticultural chemistry have advanced very much beyond their present state, that in nineteen cases out of

twenty, at least, natural manures have considerable advantages over those usually understood by the term artificial. When chemistry has advanced to such a state of knowledge that it shall be known what chemicals alone are required to bring each kind of crop to perfection, and some cheap instrument has been invented by which every one shall be able easily to ascertain exactly the constituents of the kinds of soil with which he has to deal, so that its deficiencies for the crop it is required to produce may be easily known, then unmixed chemicals may have a great advantage over natural manures, which, though they may contain in most instances all that is required, frequently also contain much that certain kinds of soil already have an abundance or perhaps a superabundance of. A time is not even then, however, likely to come when natural manures can be dispensed with, if only for the reason that where large populations exist they are produced in such enormous quantities that the only way to get rid of them, and render them innocuous, is by applying them to the land, *J. E. Ewing, Norwich, April 10.*

**Green Glasses for Cut Flowers.**—I have any of your correspondents had occasion to remark that bouquets last longer in green than in white glasses? We have proved it here over and over again, and especially notice that flowers capricious in drinking

in hundreds and thousands broadcast over the earth. It is very sad to see the wreck they make. Birds as widely different as sparrows, finches, black-birds, pheasants, have been caught in the act of destruction, so that the lovely Primroses seem to have suddenly become a general weakness among the feathered tribes. The destruction is almost as prevalent in woods and on hedgerows as in gardens, though it is notable that birds generally attack with most severity any patches of flowers placed in new positions. I have seen birds destroy again and again Sedums and such plants placed on newly-formed rockwork, though, after a time, familiarity seemed to breed contempt in the birds, and the plants were allowed to establish themselves. We had a striking proof of the extra attention of birds in novel positions here the other day. A row of common Primroses was planted against the mansion behind a line of *Myosotis dissitiflora*. The effect of the contrast was most pleasing to our eyes; but it immediately attracted the notice of the birds, and the next day not a flower nor hardly a bud was left. This notice and destruction of novelty is equally observable in regard to new colours and fresh places. We have raised a great many hybrid Primulas of differing shades of colour, from white to bright red. These were freely mixed with the common varieties on the wide verges of a woodland walk. They

and beautiful things, especially in the way of Pelargoniums, with which his name has long been associated. As bedding plants, double Petunias are unsuited, the flowers being too heavy and lumpy to stand the weather, but for pot culture for indoor decorative purposes during the summer they are quite unsurpassed among soft-wooded subjects, and as they can be got up quick and discarded without having to winter them, they are doubly valuable on that account, and especially to amateurs who have only a limited amount of glass-room and like to have a good display in their greenhouses. There are several named varieties, but as a large percentage come double from seed obtained from carefully fertilised flowers, it is hardly worth bringing these, as by sowing at once seedlings come in almost as soon, and should there be any single ones among them they are sure to be handy for borders or beds, where in patches or masses these marbled and blotched sorts are very attractive. When grown in pots, the best way, after the plants are potted and grown on in cold frames to a good size, is either to plunge them out in some open sunny spot, or to withdraw the lights from them for a few hours each day; by doing which and exposing them fully to sun and air, the shoots harden and the growth they make is much shorter jointed and more floriferous than it is when subjected to other conditions like it gets under glass. By potting in all fibry loam fine plants may be grown in 8-inch pots, and to get them well furnished, the shoots should be stopped by nipping out their points, which may be repeated again and again; and this will stiffen them in such a way that they will do without sticks. When beginning to bloom, liquid manure will be found a great help, as it is always better to administer stimulants than to use any in the solid form in the soil, the tendency of which is to produce gross growth that seldom or never flowers well. The latest claimant to public favour among single Petunias is one recently sent out under the name of *hybrida nana compacta*, which forms a densely branched bush about 8 or 9 inches high and as much through, and which when covered with bloom looks like a huge nosegay, so regular and compact is its form. The colour of the flowers is a bright red relieved by a white star, the contrast between the two being most striking. This kind, from its habit, is specially adapted for pot culture, and when better known is sure to be sought after for that purpose. *J. S.*

FIG. 101.—THE BUCKLAND YEW SEEN FROM ABOVE. (SEE P. 556.)

water, such as Olympian Hellebore and the variety *atrobens*, take it very kindly in a dark green Bohemian glass, shaped like a porringer, and last a long time. All white blooms look lovely in this glass, especially with a bit of scarlet Geranium to supply the "complementary" colour of the green, and give the full effect. Perhaps some of your scientific readers can account for the peculiarity? Homoeopathic drugs are often kept in blue vials to preserve their strength (!), and certainly plate-glass windows kill some plants outright, such as Heaths, and weaken others so as to prevent them blooming, such as Common Musk. *H. M. E., April 19.*

**The Birds and the Primroses.**—Of late years our birds of different sorts have taken unfortunate fancies for flowers. Their tastes vary in different seasons. Last year, and for several years before, for example, it was Ribes; this spring it is Primroses, Crocuses, some a general diet, of which they never tire. But the Primrose taste seems the most provoking of all. Everything with any Primrose blood in it seems to come alike to them, with the important exception of Auriculas. These have up to this period escaped; but Primroses, Polyanthus, Oxlips, and Cowslips seem to come almost alike to the birds. Not quite, however; they prefer Primroses, common and hybrid, and of all shades of colour, to either Oxlips or Cowslips. They do not eat the flowers, they simply eat their stalks through an inch or so below the flowers, and scatter the flowers

were picked so severely as not only to prevent their flowering and any decorative effect, but so as to injure the plants. Plants out of season in woods seem to suffer the same fate. In our first enthusiasm about *Primula japonica* we planted out several hundreds in masses. The birds did not like this, and pecked off their crimson flowers. Bad taste in its relation to horticulture is a very serious business. It would be a startling arithmetical problem could we work it out correctly to determine how many thousands of bushels of Plums are lost annually through the love of bullfinches and finches for the sweet morsel at the base of the flowers. For the birds neither eat the flowers nor examine them for insects, they simply nip them or drive them off so rapidly that we can scarcely see them do it—stopping now and then at intervals of fifties or so to eat and swallow the tiny morsels they have collected in their beaks in the process of demolition. For the destruction of our seeds by birds we have some compensation in the numbers of weed seeds they consume, but the birds seem to have nothing to offer the horticulturist as a set-off for the enormous number of flowers in fact and fruit in embryo they destroy or consume in our gardens and orchards. *D. T. Fish.*

**Double Petunias.**—The merit of first raising these belongs, if I mistake not, to Mr. Grieve, of Culford, who, as is well known, is one of our most successful hybridists, and through his skillful manipulation gardens have been enriched with many fine

**Fruit Prospects in Yorkshire.**—The fruit prospects this year are very poor, which, after the bad crops of the last four years, is very discouraging. Most practical men, after the little sunshine last year, anticipated light crops of our hardy fruits this year: I fear they will prove worse than many anticipated. Apricots, Peaches, Pears and Apples will be complete failures. In all my experience I do not recollect a season when Apricots, Peaches, Pears and Apples showed so little blossom; Apricots and Peaches have no blossom. The trees have suffered much from the frost, much of the young wood is killed, and some of the old is more or less injured. Apricots and Peaches outdoors will be a complete failure this year. The Pear trees show very little blossom. The pyramid and standard trees have little or no blossom, and only a few of the trees on the wall show any. Apples, too, show very little blossom, so that Pears and Apples will be very light crops. Cherry trees are full of blossom, and will probably be a good crop. Some kind of Plums have a fair show of blossom, but it is small and weak. With very favourable weather there may be a moderate crop. Strawberries promise well, and will, with favourable weather, be a good crop. Gooseberries, Currants, and Raspberries look well, and will, with favourable weather, be good crops. These will not, however, make up for the failure of the crop of Apricots, Peaches, Pears, and Apples; and 1880, however well it may prove in regard to cereal and root crops, will be a year of deficient fruit crops. *M. Saul, Stourton, Yorkshire.*

**The Past Winter and the Slugs.**—I quite agree with your leader on Miss Ormerod's experiments of the effects of cold on larvæ, &c. We have already found out that it has not lessened the number of slugs. Quantities of Pinks, Cauliflowers, Lettuces, Cabbages, have been planted out, only to disappear in a few nights. The usual dustings of lime, soot, &c., have not saved them. The spring has also been dry as well as the winter cold. Some of our oldest labourers were full of faith of the cold and dry weather cures. "They have done for the slugs, master," met our ears on all hands. One septuagenarian was so positive when urged to turn a piece of ground before planting, that he risked his all that no slugs would worry the crops this year. The fact is that, if possible, the slugs are more numerous and ravenous than ever. The latter goes without saying if the former be true, for, assuming the same number of slugs to exist, never had they so little to eat. Almost every green thing was destroyed by the winter's frosts — not an old Cabbage stalk, hardly a Broccoli or a Lettuce was

left; so that the slugs spring up on this barren soil, and immediately creep abroad in search of green and tender blades of Lettuces, Cauliflowers, Carrots, Parsley, or what-not. But the point that I wish to emphasise is that they are as numerous, or more so than ever. So troublesome were they last year that I began to lose all faith in lime as a slug killer. It must, indeed, be very hot, and frequently applied to prove effective. Salt is quicker in its action, but somewhat dangerous should an overdose be given. Paraffin is fatal to slugs, and to not a few plants in a young state, and it is also costly. Ammoniacal water and gas-lime are also deadly and most injurious to most crops as well as slugs. Kitchen garden crops seem to produce or foster slugs, though we are careful never to dig in a single green leaf or stem. Box edges are also favourite hiding places. Are there any crops so poisonous or distasteful to slugs that they could thus be cropped or grown out? So scarce is green food this year that I see the slugs have set upon our young Onions. *D. T. Fish.*

**Broccoli.**—Now that all plants of weak and doubtful constitution have been placed *hors de combat*, we may, I think, derive a certain amount of consolation from the fact, that there is here an excellent opportunity of obtaining a very hardy race of this indispensable vegetable. It is only reasonable to suppose that from seed harvested this year we shall have plants which will be proof against such weather as has within the past few months sent so many to the dung-heap. Such being the case, I would at the risk of being thought a little too presumptuous, advise seed-growers and seedsmen to use every endeavour to perpetuate the stock, and on no account mix any of the new seed with the old. It seems almost superfluous to add, that in the event of seed being mixed, and the winter of 1881-2 being comparatively mild, the chances are ten to one that plants of doubtful hardiness will be left as seed producers, and thereby the present state of things will recur, which, to say the least, is far from being desirable. *J. H., The Gardens, Heytesbury, Wilts.*

**Rhododendron ferrugineum.**—This charming dwarf-growing shrub is now gay with a profusion of its delicate rose-coloured flowers, which are borne in compact trusses and are admirably adapted for filling small glasses, or for other purposes in a cut state. There are many who would not despise a single truss for a buttonhole bouquet, and those who have a taste for delicate colours could hardly make a better selection. Every truss is furnished with an abundance of small green leaves, which renders it at once one of the most useful flowers of its class; in fact it is Nature's buttonhole ready made. It is a native of the Alps, and is therefore quite hardy. For conservatory decoration, or for the embellishment of front halls or staircases where flowering plants are in request, the habit of the plant and the hardiness of its leaves is a recommendation which deserves the notice of gardeners. Plants lifted from the open ground in January, and brought forward gently in a temperature not exceeding 50° to 55°, with frequent applications of atmospheric moisture, will be in full flower by the middle of April. *W. Hinds.*

**Stephanotis floribunda.**—The following notes may be of interest, if not useful, to some of your readers. A plant of the above, growing in a small stove here, was, after flowering last year, shifted from a small tub into one 24 inches in diameter, and trained on galvanised wires 6 inches from the roof. A compost of two parts good fibry loam, one part peat, one part half-decayed leaves, some charcoal, and sand was used, and especial care taken to secure good drainage. A vigorous growth was soon made, requiring much more space than was available. During the winter water was given very sparingly, in fact only when the leaves began to shrivel, and the temperature was generally nearer 55° than 60° at night, with a rise of 5° or 10° by day. In the first week in January the knife was used freely, thinning out two-thirds of the growth, the strongest being retained full length. When the buds began to break the supply of water was increased and the temperature gradually raised 10°. The plant is now literally laden with bloom. I counted on April 14 300 trusses open, or nearly so, and this exclusive of numerous flower-buds still green. The trusses average eight pips each, some having as many as eleven. As you do not quote Covent Garden prices for *Stephanotis*, I suppose it is not over plentiful as yet. *George Duffield, Winchmore Hill, N.*

**Caladium argyrites and Scarlet Pelargonium for Winter Decoration.**—At no time of the year are bright colours in greater request than during the winter months and at no time are they more scarce. True, there are Poinsettias with their massive floral bracts and Plumbagos and Scutellarias and Euphorbia jacquiniiflora—all beautiful plants, but defective in habit for grouping with so dwarf and chaste a plant as *Caladium argyrites*. The beautiful markings of the leaf of the latter seldom appear to better advan-

tage than where they are associated with scarlet Pelargoniums, and I prefer those of the nosegay section for the purpose. *La Grande* is my favourite. It produces enormous trusses, even in small pots, when generously cultivated. The Pelargoniums are easily obtained of any size that is needed, but to have *Caladiums* in good condition in the month of November requires forethought. The *Caladiums* should be kept back for two or three years by potting them a month later each year until they are gradually worked round to come in at the time desired. A good stock of such plants would render invaluable service in many places in the winter months, and there are other taller growing *Caladiums*, such as *Belleymeis*, that are nearly as effective and would work in with taller growing subjects, or they would impart elegance to a group by "dotting" them about, still keeping the dwarf plants of *argyrites* for forming the front row. *W. Hinds.*

## Reports of Societies.

### Royal Horticultural: April 27.

SCIENTIFIC COMMITTEE.—Sir J. D. Hooker, K.C.S.I., in the chair.

**Injury to Cypress.**—Some further statements were made as to Mr. Boscawen's Cypress, Mr. MacLachlan adhering to his previously expressed opinion.

**Insects Injurious to Larch.**—Mr. Elwes showed specimens covered with eggs of a *Chermes*, and, in addition, myriads of the larva of one of the Tineous moths, *Coleophora laricella*, the larvæ of which mine in the leaves, and make cases for themselves out of the cuticle. As the insects are so extremely numerous and over so large an area, anything like a practical remedy is almost out of the question; but it was suggested by Mr. MacLachlan that setting fire to the long grass might be efficacious.

**Tulips.**—Mr. Elwes showed specimens of *T. Kolpakowskyana* and of *T. Eichleri*, to show the result of one year's cultivation on the size and form of the flowers, the flower after one year's cultivation being, at least, three times the size that it was originally. Conversely Mr. Elwes had succeeded in reducing the size of the scarlet Van Thol Tulip to the diameter of 2 inches or thereabouts. As an inference of these experiments, as well as of the fact that little or no difference was to be seen between Central Asian and Italian Tulips, Mr. Elwes stated that the characters at present in use to distinguish Tulips are of little weight, and that most of the so-called species would eventually be reduced to geographical forms or varieties.

**Specimens Exhibited.**—In addition to the species above named Mr. Elwes showed *T. Didieri*, from Savoy; *T. saxatilis*, or an allied species, from Teheran; *Scilla lilio-hyacinthus*; *Fritillaria olympica*, with greenish flowers, from Broussa; *F. pallidiflora*, from Siberia; *F. obliqua*, a plant long known in gardens, but not known in a wild state; it has ascending, spirally twisted leaves; *Kolpakowskyia ixiolirioides*, a blue flowered plant, with the habit of an *Ixiolirion*; *Cypripedium pubescens*, with two flowers; *Primula mollis*, from Bhotan; *Arnebia echioides*, which has the property of blooming twice or three times in the year; *Streptopus roseus*, various species of *Muscari*, *Erythronium grandiflorum* and *Bomarea Cالداسii*.

**Renanthera coccinea.**—Sir J. D. Hooker showed a portion of a panicle of this superb Orchid grown in Lord Fortescue's garden. The specimen was a remarkably fine one.

**Dragon's Blood Tree.**—Sir J. D. Hooker also showed a drawing by Professor Bayley Balfour, made in Socotra, of a fine arborescent *Dracæna*, which produces the Dragon's-blood of Socotra. It is the *Cinnabara* of Dioscorides, Socotra itself being formerly called *Dioscorida*. The Dragon's-blood is used as a varnish.

**The Question of the Phyllovera.**—Dr. Masters again brought under the notice of the committee the restrictive laws regulating the introduction of living plants into certain European countries, as also into Cape Colony and Fiji. The futility of the regulations was pointed out as well as the needless injury inflicted on horticulture. Some discussion ensued, and ultimately it was decided that Dr. Masters should represent the matter to the Council on behalf of the committee, in order that the Society might take action on the matter.

FLORAL COMMITTEE.—Dr. Denny in the chair. The exhibition of plants and flowers forming part of the floral display on the present occasion was not extensive, but interesting.

The place of honour is due to the GROUP OF ORCHIDS contributed by Sir Trevor Lawrence, Bart., M.P., a finer collection from one establishment being rarely seen. It consisted of about three dozen plants, of which nearly all were specimen plants. At one end stood a grand example of *Lycaste Skinneri*, the base of which was thickly studded round with noble flowers, far too numerous to count; a splendid *On-*

*cidium ampliatum majus* had eleven spikes of its lively yellow flowers; a grand branching spike of *O. Marshallianum*, and a good *O. sarcodes* balanced this near the other end of the collection, where stood the gem of the whole group—*Masdevallia Harryana*, a remarkably fine variety, of an intensely deep and rich colour, forming a crowded cluster of about forty blossoms. *Dendrobium thyrsiflorum* had nine fine spikes of its finely contrasted flowers, and near it was a striking plant of *Lælia cinnabarina* with four spikes of its telling orange flowers. *Odontoglossums*, of course, were in strong force: there was first a small plant of the very large-flowered form of *O. Koezii*, which has been shown under the varietal name *superbum*; *O. nevium*, and the related *O. cirrosium*, *O. citrosimum*, and *citrosimum roseum*, both well bloomed; *O. hystrix serratum*, a fine variety, described below; *O. triumphans*, *O. Pescatorei* and *Alexandre*; *O. Phalenopsis*, nicely bloomed; a neat little plant of *O. maculatum superbum*, *O. Andersonianum*, with crimson-spotted white flowers; *Cypripedium caudatum*, a small plant, with five magnificent flowers; *C. Crossianum*, with purple-tinged petals and lip, and strongly white-tipped dorsal sepal; *Cattleya Mendelii* and *C. Mossie*, always showy and attractive; and others which we have not space to record. This group was awarded a Gold Medal.

Messrs. Paul & Son, Old Nurseries, Cheshunt, had a grand group of POT ROSES, consisting of large specimen and half-specimen plants, the larger ones finely, the smaller prettily bloomed. A rich looking flower amongst the smaller plants was *Souvenir de Victor Verdier*, a high-coloured crimson; Mrs. Laxton, a bright cerise-rose, proved itself a good flower; and an exquisite Tea Rose was included, namely, *Madame Lambard*, with rosy-edged pale petals, the central parts of the flower flushed with a rich coppery hue. This group received a Gold Medal, and a Silver Medal was awarded to Messrs. W. Paul & Son, Waltham Cross, who sent six boxes of fine cut Roses, which were fresh and good, and found many admirers. Messrs. Veitch & Sons also had a group of standard Roses in pots, numbering some fifty plants, arranged on the ground level, intermixed with Japanese Maples; these were very nicely bloomed, contributing much towards making this an attractive Rose show, and winning a Gold Medal.

Mixed groups of plants were shown by Messrs. Osborn & Sons, of Fulham, and by Mr. Aldous—Silver Medals to each; and a group of *Primula Sieboldii* varieties and of *Selaginellas* came from Chiswick. Two baskets of *Begonia*—*B. Coltoni*, a crimson-scarlet, and *B. Rodwellii*, a light scarlet, but fine large showy flowers—rewarded with a Bronze Medal—were shown by Messrs. C. Lee & Son, of Hammersmith; and Messrs. Barr & Sugden had a fine collection of cut blooms of *Narcissi*, in which the fine trumpet forms *N. bicolor maximus* and the variety called *Emperor* were very conspicuous.

The subjects more immediately brought under the notice of the committee comprised a *Myosotis elegantissima* from Messrs. Rodger, McClelland & Co., of Newry; it has the leaves broadly edged with white and pale blue flowers, and though a neat-looking plant was considered not effective. Mr. W. Bull, of Chelsea, exhibited *Acacia spheroccephala*, a very interesting and by no means unornamental plant, with glossy compound leaves, and huge brown hollow thorns, in which a species of ant makes its domicile, whence it sallies forth to defend the plant against all other intruders, taking toll for itself in the honeyed secretion formed in the glands on the leaflets. *Maranta Kerchoveana*, a species too near *M. Massangeana*; *Drosera filiformis*, a curious little plant, growing about 6 inches high, with glandular-margined erect linear leaves; and *Sarracenia flava ornata*, one of the strongly-veined varieties of this interesting side-saddle flower. Messrs. Veitch & Sons, of Chelsea, showed a mottled leaved *Erythrina*, called *marmorata*; a handsome *Amaryllis*, named *Lady Bolsover*; *Azalea Kollissoni*, and *Lastrea Richardsii multifida*, all noticed below; *Kentia McArthurii*, a pretty pinnate Palm; and *Azalea Roi Leopold alba*, a useful decorative variety, very floriferous, with moderate-sized flowers, which are occasionally flaked with rose; *Pteris serrulata Shorei*, a very heavily crested variety of drooping habit—a variety which was thought to be too much depressed by the dilatations of the crest, but, nevertheless, likely to be a very useful plant for basket culture; *Azalea hydrangeæiflora*, one of the *arœna* forms. Messrs. Veitch also exhibited, on behalf of Mr. Tinné, of Liverpool, three *Crotons* named *Tinneanus*, with trilobate leaves; *Briarleyensis*, with sublobate leaves; and *Clokei*, with oblong-acuminate leaves, all with yellow costa and veins, but in the small state showing no marked novelty of character. Mr. Barnett, of the Deepdene Gardens, exhibited a plant of *Pleopeltis Billardieri*, a relic of the *Vanguard*. From the New Plant and Bulb Company came *Odontoglossum Hoersmanni*, with yellowish flowers heavily blotched with brown. Messrs. Sian-dish & Co., of Ascot, showed two white-flowered hybridised *Rhododendrons*, which were stated to be

perfectly hardy, but which had been flowered under glass. They were considered to be valuable plants for forcing and decorative purposes indoors, and were certificated as such, with a request that they might be shown later on as bloomed in the open ground. The best of the two was called Snowflake, the other Flag of Truce. Mr. King, gr. to G. Simpson, Esq., Wray Park, Reigate, showed one of the most brilliant varieties of *Coleus* we have yet seen; it was named George Simpson, and was worthily certificated. Another, named Adelaide Baxter, a fringed-leaved sort, with magenta feather on maroon, elegantly margined with green, though pretty, was not at all comparable in merit to its companion. From H. J. Elwes, Esq., came cut specimens of the pretty *Corydalis bracteata*, a species with long spikes of large yellow flowers subtended by conspicuous green bracts, and certainly one of the finest of the family—not a new plant, having been introduced sixty years since, but now seldom met with. Messrs. E. G. Henderson & Son sent branches of a *Hedera* from Northern Russia, very much in the way of *H. dentata* as to substance, size, and general character, but apparently producing more acutely lobed leaves. Hemsley's Giant Mignonette was shown in fine condition from Chiswick, and had a Cultural Commendation.

#### NEW PLANTS CERTIFICATED.

First-class Certificates were awarded to Mr. King, gr., Wray Park, for *Coleus* George Simpson; this splendid variety has flat ovate leaves of the richest glowing crimson, dashed with maroon, the narrow beaded edge being here green, there gold, and all the colours bright and effective, and well brought out for contrast; it is in every way a *l. i.* To Sir Trevor Lawrence, Bart., for *Odontoglossum serratum*, a form of *hystrix*, with uniform sulphur-yellow sepals and petals, the former cross-banded with rich chestnut-brown, the latter spotted with the same, and very strongly serrated. To H. J. Elwes, Esq., Cirencester, for *Corydalis bracteata*, a dwarf hardy tuberous perennial with spikes of large bracteated pale yellow flowers. To Messrs. Standish & Co., Ascot, for *Rhododendron Snowflake*, a handsome hybrid, with large heads of fine flowers which, when developed as these were under glass, are of a very pure white, without apparent spotting, the individual flowers being smooth and well formed. The plant itself is quite hardy, but the certificate was awarded to mark the merit of the variety as a forced plant. To Messrs. Veitch & Sons, of Chelsea, for *Lastrea Richardii multifida*, a pretty tasselled fern, of elegant character, the apices of the pinnatifid being prominently developed into a tuft of sharp-pointed segments; for *Amaryllis* (*Hippeastrum*) *Lady Bolsover*, a variety of good form, scarlet with a well defined white stripe down to the base, which is dark-coloured, and more or less veined with white, a distinct and showy kind; and for *Azalea Rollissonii* as a decorative plant and one useful for cutting, the pretty little compact double salmony-red flowers being well adapted for this purpose; and the small growing plant itself being well adapted for growing in the form of dwarf standards. A Second-class Certificate was given to Messrs. Standish & Co., Ascot, for *Rhododendron Flag of Truce*, a white of considerable merit, equally hardy, but less pure and less smooth than *Snowflake*. A Cultural Commendation was awarded to Mr. W. Bull for a panful of the pretty *Drosera filiformis*, which was admirably cultivated.

FRUIT COMMITTEE.—John Lee, Esq., in the chair. Examples of the Giant Zittau Onion, from Mr. E. Benary, of Erfurt, were exhibited. It is a root of handsome appearance, clean, with a yellowish skin, and was commended, as being apparently a good keeping variety. Mr. Miles, gr. to Lord Carington, of Wycombe Abbey, showed some excellent examples of fresh Black Hamburgh Grapes, together with samples of the Stanstead Winter Cabbage Lettuce, in excellent condition for use. This Lettuce was brought forward for the purpose of showing what can be done in this way by means of a very simple contrivance, consisting of four 11-inch boards, fixed securely upright, the space enclosed being covered with lights, and with mats also when necessary. The area which Mr. Miles has devoted to this purpose this season is 14 feet by 10 feet—a space which contained about 400 plants, which were pricked out in lines last autumn, 6 inches apart every way. From this frame Lettuces have been cut almost equal in quality to the samples shown [excellent in every way] since the beginning of the present month, and enough still remains to keep up a supply till the next crops come in.

National Auricula—Northern Section: April 27.—The annual exhibition of this section of the National Auricula Society was held on Tuesday, in the Town Hall, Manchester, in conjunction with one of the spring meetings of the Manchester Botanical and Horticultural Society, and though by no means so large a show as that of last year, or even that held by the other division of the Society at South Kensington last week, we think, as regards the latter at all

events, that the quality was somewhat higher. As in the South, so it has been in the North this season, the flowers came out earlier than usual, and lasted a shorter time—a *contretemps* that has kept some of the exhibitors out of the field altogether, and crippled the powers of many others. The Rev. F. D. Horner was not in the competition at all on Tuesday, and Mr. Ben Simonite, who last year staged about fifty plants, on this occasion could only show a fifth of the number. There was no class here for twelve plants as at Kensington, nor for fifty either, and consequently the cream were shown in the class for six. The show of alpine, which are here divided into two classes according to the colour of the centre, white or yellow, was not so pleasing as at Kensington—the rule which excludes other than shaded flowers keeping away the brilliant selfs that in the South are so much admired. As regards Polyanthuses there was no comparison between the two displays, so vastly superior was the exhibition of to-day over its predecessor. The best Auricula in the show was Walker's John Simonite—a grand truss of eight pips, shown by Mr. H. Wilson, of Halifax, in his 1st prize group of six; while the 2d prize lot in the same class also included the best green-edged Auricula in the show—Kay's Alexander Meiklejohn, shown by Mr. T. Mellor, with eight very fine pips. A very neat truss of six pips of Lancashire Hero, shown by Mr. E. Pohlman, was the best green-edged flower.

For six Auriculas, dissimilar, exclusive of alpine.—Mr. H. Wilson, of Halifax, came in 1st with Colonel Taylor (Leigh), George Lightbody (Headly), John Simonite (Walker), a splendid truss of eight pips; Alexander Meiklejohn (Kay), C. J. Perry (Turner), and Prince of Greens (Trail). 2d, Mr. T. Mellor, Ashton-under-Lyne, with Alexander Meiklejohn (Kay), a fine truss of eight pips; Lovely Ann (Oliver), and four seedlings, a green-edged, grey-edge, white-edge, and a maroon self. 3d, Mr. E. Pohlman, Halifax, with Earl Grosvenor (Lee), Aeme (Read), Colonel Taylor (Leigh), George Lightbody (Headly), Mazzini (Pohlman), and New Green (Headly). 4th, Mr. W. F. Bateman, Low Moor, Bradford, with Confidence (Campbell), Lord Palmerston (Campbell), Lovely Ann (Oliver), Catherina (Summer-scapes), Conqueror of Europe (Waterhouse), and Onwards, a lovely violet self in the way of Turner's Charles J. Perry. 5th, Mr. W. Brockbank, Didsbury, with Ellen Lancaster (Pohlman), Maggie Lauder (Lowe), Lancashire Hero (Lancashire), Alexander Meiklejohn (Kay), Metropolitan (Spalding), and Richard Headly (Lightbody). 6th, Miss Steward, York, with Alderman Wisbey (Headly), Meteor Flag (Lightbody), Beauty (Trail), George Lightbody (Headly), Colonel Champneys (Turner), and a white-edged seedling. 7th, Mr. J. Goodier, Stakehill, with Lancashire Hero (Lancashire), Pizarro (Campbell), George Lightbody (Headly), Privateer (Grimes), C. J. Perry (Turner), and Catherina (Summer-scapes).

For four Auriculas, dissimilar, alpine excluded.—1st, Mr. E. Pohlman, with Confidence (Campbell), Mazzini (Pohlman), Earl Grosvenor (Lee), and Imperator (Litton). 2d, Mr. Wilson, Halifax, with Aeme (Read), Lancashire Hero (Lancashire), Garibaldi (Pohlman), and Prince of Greens (Trail). 3d, Mr. T. Mellor, with Lovely Ann (Oliver), Lancashire Hero, Metropolitan (Spalding), and a white-edged seedling. 4th, Mr. W. F. Bateman, with Prince of Wales (Ashworth), Confidence (Campbell), Conqueror of Europe (Waterhouse), and Lord of Lorne (Campbell). 5th, Mr. James Bentley, Stakehill, with Lancashire Hero, Ne Plus Ultra (Smith), Pizarro (Campbell), and Lovely Ann (Oliver). 6th, Miss Steward, with Ne Plus Ultra (Smith), Lord Clyde (Campbell), Lovely Ann (Oliver), and a white-edged seedling. 7th, R. Gorton, Esq., Eccles, with Lancashire Hero, Glory (Taylor), Lovely Ann (Oliver), and C. J. Perry (Turner).

For a pair of Auriculas, dissimilar in variety and class.—1st, Mr. A. Shaw, Bury, Lancashire, with Alexander Meiklejohn (Kay), and Lovely Ann (Oliver). 2d, Mr. W. Beswick, Middleton, with Lovely Ann (Oliver), and a dark seedling self in the way of Vaulan (Sims). 3d, Mr. H. Wilson, with George Lightbody (Headly), and Prince of Greens (Trail). 4th, Mr. J. Goodier, with George Lightbody (Headly), and Blackbird (Spalding). 5th, Mr. T. Mellor, with Lovely Ann (Oliver), and a grey-edged seedling. 6th, Mr. Ben Simonite, with George Lightbody (Headly), and Mrs. Douglas (Simonite). 7th, Mr. James Bentley, with George Lightbody and Leigh's Colonel Taylor.

For a pair of Auriculas (open only to maiden growers).—1st, Mr. A. Shaw, Bury, with C. J. Perry (Turner), and Alderman C. E. Brown (Headly). 2d, Mr. J. Goodier, with George Lightbody and Blackbird. 3d, Mr. William Bolton, Warrington, with Beauty (Trail), and Lovely Ann (Oliver). 4th, Mr. James Bentley, with George Lightbody and Colonel Taylor (Leigh).

One Auricula, green-edged.—Premium, Mr. E. Pohlman, with Lancashire Hero, a very neat truss of six pips.—1st, Mr. H. Wilson, with Colonel Taylor (Leigh); 2d, Mr. Ben Simonite, with a seedling, a good bright green; 3d, Miss Steward, with Lovely Ann (Oliver); 4th and 5th, Mr. E. Pohlman, with Imperator (Litton), and New Green (Headly); 6th, Mr. Ben Simonite, with Talsman (Simonite); and 7th, Mr. T. Mellor, with Lord Palmerston (Campbell).

One Auricula, grey-edged.—Premium, Mr. T. Mellor, with Richard Headly (Lightbody).—1st, Miss Steward, with Alma (Lightbody); 2d, W. Brockbank, Esq., with Alexander Meiklejohn (Kay); 3d and 4th, Mr. A. Shaw, with Richard Headly (Lightbody), and Lancashire Hero (Lancashire); 5th and 6th, Mr. E. Pohlman, with

General Bolivar (Smith), and Beauty (Trail); 7th, Mr. H. Wilson, with George Levick (Walker).

One Auricula, white-edged.—Premium, Mr. J. Booth, Fairworth, with Aeme (Read).—1st, Mr. Pohlman, with Catherina (Summer-scapes); 2d, Mr. Pohlman, with Earl Grosvenor (Lee); 3d, W. Brockbank, Esq., with Aeme (Read); 4th, Mr. T. Mellor, with Richard Headly (Lightbody); 5th, Mr. T. Mellor, with Beauty (Trail), and Smiling Beauty (H-19); 7th, W. Brockbank, Esq., with Fright Venus (Lee); 8th, John Waterston (Cunningham), shown by an exhibitor whose name we did not get.

One self Auricula.—Premium, Mr. A. Shaw, with W. E. Gladstone, a dark maroon seedling.—1st, Mr. T. Mellor, with a very dark seedling; 2d, Mr. H. Wilson, with Sapphire (Horner), a lovely violet; 3d, Mr. A. Shaw, with Ellen Lancaster (Pohlman); 4th, Mr. Pohlman, with Blackbird (Spalding); 5th, Mr. T. Mellor, with a dark maroon seedling, 6th, an exhibitor, whose name we missed, with C. J. Perry (Turner); 7th, Mr. J. Beswick, with a very dark seedling; 8th, Mr. Ben Simonite, with Mrs. Douglas (Simonite).

Four alpine Auriculas, dissimilar.—Mr. A. Shaw, Bury, with Fair Rosamond, Elcho, Diadem, and John Leech; 2d, Mr. John Beswick, with Dolly Varden, James Douglas, Diadem, and Goliath; 3d, R. Gorton, Esq., with Stirling Castle, Marion, Evening Star, and Geo. Lightbody; 4th, Miss Steward, with four seedlings; 5th, Mr. W. Brockbank, with John Leech, Ovid, Diadem, and Diana.

One yellow-centred alpine Auricula.—Premium, Mr. A. Shaw, with John Leech (Turner).—1st, Mr. Pohlman, with Pioneer (Pohlman), a very distinct flower, shaded orange-buff; 2d, Mr. J. Beswick, with Diadem (Gorton); 3d, Mr. Beswick, with Queen of England; 4th and 5th, R. Gorton, Esq., with Queen Victoria and Evening Star.—White centred: Premium, Miss Steward, with a lilac-mauve shaded seedling.—1st, Mr. A. Shaw, with Elcho (Turner); 2d, Mr. T. Mellor, with Conspicua; 3d, Miss Steward, with a dark violet-purple shaded seedling; 4th, Mr. J. Beswick, with Goliath; 5th, S. Barlow, Esq., with Miss Read.

Three dissimilar, black ground Polyanthuses.—1st, Mr. J. Beswick, with Lord Lincoln (Hufton), Cheshire Favourite (Saunders), and Exile (Crownshaw); 2d, Wm. Brockbank, Esq., with Exile, Cheshire Favourite, and Beauty of England (Maud); S. Barlow, Esq., with President (Hilton), Exile, and Cheshire Favourite.—Red grounds:—1st, Mr. J. Beswick, with President, George IV. (Buck), and an unnamed variety; 2d, W. Brockbank, Esq., with George IV., President, and Cox's Prince Regent; 3d, S. Barlow, Esq., with Sunrise (Barlow), Lancer, and George IV.; 4th, Mr. W. Bolton, with three unnamed.

One Polyanthus.—Premium, Mr. J. Beswick, with Buck's George IV.—1st and 2d, Mr. J. Beswick, with George IV. and Exile; 3d, Mr. W. Whittaker, Salford, with a black ground seedling; 4th, Mr. J. Beswick, with Lord Lincoln; 5th, Mr. T. Mellor, with a red ground seedling; 6th, Mr. J. Beswick, with Cheshire Favourite. Mr. W. Bolton's special prize for the best red ground seedling Polyanthus was won by Mr. Mellor, with a flower of fair quality; while that for the best black was taken by Mr. Whittaker, of Salford, with a flower of very great promise, and not likely to be soon beaten.

Mr. Barlow, Mr. W. Bolton, and Mr. Bateman, took the prizes for twelve distinct fancy Auriculas; while W. Brockbank, Esq., was 1st for the same number of fancy Polyanthuses and Primroses, and S. Barlow, Esq., 2d for the latter.

#### Manchester Botanical and Horticultural:

April 27 and 28.—A spring show of this Society was held on Tuesday and Wednesday (on the former day in conjunction with the Auricula show), but calls for little notice. To Thomas Agnew, Esq., Fair Hope, Eccles, near Manchester (Mr. Elkin, gr.), the Society's Silver Medal was awarded for a group of plants which was placed at the foot as it were of the grand organ, and made a beautiful foreground. Its principal components were large and well flowered *Azaleas*, a good *Clerodendron Balfourianum*, half-a-dozen superbly flowered *Deutzias*, &c. Messrs. R. P. Kerr & Son, Liverpool, received a Silver Medal for a large group of flowering and fine-foliaged plants, the former consisting of *Azaleas*, *Felargoniums*, varieties of *Azalea mollis*, and of *Primula Sieboldii*, and handsomely bloomed dwarf plants of *Spiraea palmata*. The same firm also had a First-class Certificate for a handsome new species of *Lomaria*. A similar award was made to W. Turner, Esq., for a supposed hybrid *Odontoglossum* named *Boltii*, a pale rose-coloured flower heavily spotted with brown, but which we think must be regarded as a fine type of *O. Ruckerianum* only. The best plant exhibited was a specimen of *Odontoglossum gloriosum*, a distinct and well marked form, with four branched spikes of closely packed flowers, shown by M. Spark, Esq., and awarded a First-class Cultural Certificate. First-class Commendations were awarded to W. Turner, Esq., for a box of choice cut blooms of *Orchids*; to James Fildes, Esq., for a nice group of *Sarracenas*, including *S. Drummondii* alba in flower, *S. variolaris*, and *S. Fildesii*, a natural hybrid; to J. G. Adams, Esq., for a small group of dark red seedling *Amaryllis*; and to Messrs. R. Dyer, McLeland & Co., of Newry, for a fine sample of the new white variegated *Myosotis*, a boldly variegated, distinct, hardy spring bedding plant. The executors of Mr. H. Walton, Edge End, Barley, sent a group of small *Azaleas*, &c.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, APRIL 28, 1880.

April 22.—Generally fine but cloudy. A shower at 3 P.M. Cloudless at night.  
 — 23.—A fine bright day, partially cloudy. Cloudless at night.  
 — 24.—A fine day, but sky clouded, though clear at times.  
 — 25.—Dull till 10 A.M., fine and bright afterwards. A fine day. Cold and cloudless at night.  
 — 26.—Fine till 11 A.M., dull with rain till 2 P.M., generally fine but cloudy afterwards. Cold.  
 — 27.—A fine bright day, partially cloudy. Very cold.  
 — 28.—A very dull cold day. Overcast throughout.

LONDON: *Barometer*.—During the week ending Saturday, April 24, in the vicinity of London the reading of the barometer at the level of the sea increased from 29.94 inches at the beginning of the week to 30.06 inches by noon on the 18th; decreased to 29.85 inches by the evening of the 19th; increased to 30.06 inches by the morning of the 21st; decreased to 29.84 inches by the afternoon of the 22d; increased to 30.12 inches by the evening of the 23d; and decreased to 29.98 inches by the end of the week. The mean reading for the week at sea level was 29.98 inches, being 0.15 inch above that of the preceding week, and 0.04 inch above the average.

*Temperature*.—The highest temperatures of the air observed by day varied from 67½° on the 19th to 57½° on the 22d; the mean value for the week was 61°. The lowest temperatures of the air observed by night varied from 37½° on the 23d to 48½° on the 19th; the mean value for the week was 42½°. The mean daily range of temperature in the week was 18½°, the greatest range in the day being 23¾°, on the 23d, and the least 13¼°, on the 22d.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—April 18, 49°.7, + 2°.7; 19th, 57°.1, + 9°.9; 20th, 51°.3, + 3°.9; 21st, 48°.8, + 1°.2; 22d, 49°.1, + 1°.3; 23d, 48°.5, + 0°.5; 24th, 49°.4, + 1°.2. The mean temperature of the air for the week was 50°.6, being 3° above the average of observations extending over a period of sixty years.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 138° on the 19th, 135° on the 18th, and 129° on the 20th; on the 24th the reading did not rise above 94°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 30½° on the 18th, and 32¾° on the 23d; the mean of the seven lowest readings was 37°.

*Wind*.—The direction of the wind was S.S.W., and W.S.W., and its strength strong.

The weather during the week was fine, bright, and warm.

Rain fell on two days; the amount measured was 0.28 inch.

ENGLAND: *Temperature*.—During the week ending Saturday, April 24, the highest temperatures of the air observed by day were above 66° at Blackheath, Cambridge, Norwich, and Hull, and below 61° at Plymouth, Bristol, Wolverhampton, and Bradford; the mean value from all stations was 63½°. The lowest temperatures of the air observed by night were below 37° at Truro, Plymouth, Wolverhampton, and Nottingham; and above 42° at Liverpool and Sunderland; the general mean from

all places was 38°. The extreme range of temperature in the week was above 30° at Blackheath, Cambridge, and Nottingham, and below 21° at Brighton, Bristol, and Liverpool; the mean range of temperature from all stations was 25½°.

The mean of the seven high day temperatures was above 61° at Blackheath, Cambridge, Norwich, Nottingham, and Sunderland, and below 57° at Plymouth, Bristol, Liverpool, and Bradford; the mean from all places was 59½°. The mean of the seven low night temperatures was below 43° at Blackheath, Wolverhampton, Nottingham, Hull, and Leeds, and above 45° at Plymouth and Norwich; the general mean from all stations was 43¾°. The mean daily range of temperature in the week was above 19° at Cambridge and Nottingham, and below 11½° at Plymouth and Liverpool; the mean daily range from all places was 15¾°.

The mean temperature of the air for the week from all stations was 50°, being 6¼° higher than the value for the corresponding week in 1879. The mean temperature was above 51° at Cambridge, Norwich, Nottingham, and Sunderland, and below 49° at Bristol, Wolverhampton, Liverpool, Bradford, and Leeds.

*Rain*.—The amounts of rain measured during the week varied from 0.59 inch at Bristol and 0.45 inch at Cambridge to 0.05 inch at Sheffield and 0.06 inch at Wolverhampton, Norwich, and Sunderland. At Leeds no rain was measured. The average fall over the country was 0.22 inch.

The weather during the week was fine, bright and warm. A lunar halo was seen at Cambridge on April 23.

SCOTLAND: *Temperature*.—During the week ending Saturday, April 24, the highest temperatures of the air observed by day varied from 61° at Dundee to 56¾° at Glasgow, the mean from all places was 58½°. The lowest temperatures of the air observed by night varied from 37¼° at Edinburgh to 42° at Glasgow; the mean value from all stations was 39°. The mean range of temperature in the week was 19½°.

The mean temperature of the air for the week from all stations was 48¾°, being 7½° higher than the value for the corresponding week in 1879. The highest were 49½° at Leith and 49¼° at Dundee, and the lowest were 48° at Aberdeen and Greenock, and 48½° at Perth.

*Rain*.—The fall of rain was generally large, and varied from 2.10 inches at Greenock and 1.78 inch at Edinburgh, to 1.15 inch at Dundee and 1.20 inch at Aberdeen; the average fall over the country was 1½ inch.

DUBLIN.—The highest temperature of the air was 59¾°, the lowest 39½°, the extreme range 20¼°, the mean 49¾°, and the amount of rain 0.42 inch.

JAMES GLAISHER, F.R.S.

Variorum.

HOUSES FOR MARKET PLANT GROWING.—There is nothing that occurs to us connected with gardening that has so much changed as the description of houses in use by those who grow plants and flowers for the London market. Looking back, say a score of years, it used to be a subject for comment that those engaged in this branch of horticulture paid little regard to the kind of structures they employed, provided the means were such as to enable the requisite temperature to be kept up. Light, one of the most important of all elements to plant-life, evidently was looked upon as a matter of secondary importance, for the houses were often lean-to erections put up against any existing available wall, with a view to saving something in the first cost, and perhaps to some extent with an eye to a less consumption of fuel. To dear glass were no doubt attributable the small squares with their numerous laps, as also the heavy rafters, which all had a tendency in the same direction—to diminish the light, of such importance to a strong robust character in the plants cultivated within them. Plenty of these kinds of old houses no doubt are yet made to do duty, but amongst the best growers almost the whole of this description have been swept away, and others of a character as different in the matter of the light afforded as it is possible to make them are now used; instead of the little squares, the glass is now often 14 or 15 inches wide by 2 feet in length, with the woodwork in the roofs that carry it trussed and tied, so as to permit of the bars being reduced in substance to the lowest possible point consistent with stability. The houses of the modern market growers are like those of times past, inasmuch that they are strictly utilitarian in their construction; little attention is given to finish or appearance, but if they are examined closely in many cases it will be found that in the important matter of timber the much dearer, but long-enduring, Pitch Pine is taking the place of the ordinary yellow deal. In the essential matter of position, those in private establishments, who have the erection of new

plant-houses under their control, might with advantage follow the lines of the market growers, particularly in the care that is now taken to keep them away from everything in the shape of high walls, trees, or other objects that diminish the light. Through this not being foreseen or acted upon there is many a range of otherwise good houses so very much reduced in usefulness that all the care and skill possible in cultivation can never enable the grower to produce plants equal to those that are grown in suitable houses situated in a good position.

Enquiries.

He that questioneth much shall learn much.—BACON.

THE PINES OF RAVENNA.—It has been lately stated that these trees, celebrated by Dante and Byron, have suffered considerably from the late severe winter. Can any of your readers say if they are Stone Pines (*Pinus Pinca*), or *Pinus maritima*? G., Bath.

Answers to Correspondents.

BULBS FOR EXHIBITION: *Exonian*.—Neither *Caladiums*, *Gloxinias*, nor *Anemones* are bulbs, strictly speaking, and therefore they would not be properly admissible to a "Miscellaneous Collection of Bulbs" for exhibition, unless there is some note or regulation permitting a very broad definition of the term. In all the cases cited the so-called roots are tubers.

DAMAGED LEAVES: *W. H. G.* The cause is, no doubt, bad glass, the mischief being owing to sunburn.

DANDELIONS: *J. A. C.* We know of no method better than extirpation. A dressing of nitrate of soda, or of ammonia salt, would develop the grasses at the expense of the weeds.

DEFECTIVE PINE-APPLE: *Constant Reader*. The Queen section of all others is less liable to ripen in such a way. Very powerful rays of sunshine will by means of a defect in the glass form a focus, and its operation upon a fruit would be similar to the defect described, but this would hardly be the case yet. Conical shaped and deep fruiting kinds, as *Black Prince*, *Prince Albert*, and others, at certain times will not ripen perfectly, and this may be the case with the Pine in question.

GOLDEN FEATHER PYRETHRUM: *W.* This was sent out in 1867 by Messrs. E. G. Henderson & Sons, having been raised in a cottager's garden at Ipswich, and acquired by Messrs. Henderson, by whom it was exhibited. It was not at first known that it would reproduce itself by seed.

GRUBS: *J. I. C.* They were smashed when they reached us; but we think they are the larva of the Daddy Longlegs.

INDIAN TEA PLANTATIONS: *Cor.* Apply to the India Office, or the Secretary of the Society of Arts.

INSECTS: *I. G.* The destructive weevil (*Otiorhynchus sulcatus*, *Gard. Chron.* 1841, p. 292). *I. O. W.*—*W.* Your Raspberry shoots are infested with the red caterpillar of a pretty little moth (not with a weevil as you suppose), *Tinea variella*. Nothing but crushing the buds will destroy them now the caterpillars are full-grown (see *Gardeners' Chronicle*, 1853, p. 757). *I. O. W.*—*Dr. Morton*. The insect sent is the larva of one of the ground beetles (*Carabus*, sp.). It feeds on other insects and worms, and should be protected. *I. O. W.*—*A Country Seedsman*. The seed Peas sold, apparently in an entire condition, were infested with the Pea weevil (*Bruchus Pisi*), the larvæ of which had lived within the Pea and eaten its interior, and then become perfect beetles, which, when the Peas were soaked in water before planting, ate their way out and floated on its surface (see *Gardeners' Chronicle*, 1843, p. 189). *I. O. W.*—*J. C. M.* The larvæ sent with the diseased Wheat plant are those of the Chlorops lineata, or Wheat-fly (see *Gard. Chron.* 1848, p. 780, and p. 798 for figures). The plants so attacked will most probably throw out strong side-shoots. *I. O. W.*

NAMES OF PLANTS: *T. H. Balding*. 1, The Snowy Mespilus (*Ameianchier vulgaris*); 2, *Chrysanthemum*, or *Pyrethrum frutescens*, whichever you please; 3, the Winter Aconite is *Eranthis hiemalis*.—*H. Munro*. 1, *Agopodium Podagraria*; 2, *Geranium Robertianum*.—*Brasil*. *Cattleya Forbesii*.—*J. G. N.* *Orobis vernus*.—*F. R. S.* *Oncidium spheacelatum*.—*W. Caust*. *Lonicera Ledebourii*.—*D. B.* 1, *Sedum acre*; 2, *Saxifraga crassifolia*; 3, *Cissus heterophylla variegata*; 4, *Ficus stipulata* (repens).—*A. Prescott*. *Lonicera xylostemum* (the Fly Honey-suckle).—*C. W. D.* Apparently *Claytonia caroliniana*.—*Cannon & Reid*. One of the forms of *Narcissus poeticus*—as far as can be judged from the material sent, the form called *plieatus*. The Polyanthus are good border flowers, but nothing more.—*Mrs. Prescott*. [*Lonicera xylostemum*, D. B.]

PEACH LEAVES: *A Somerset Gardener*. The falling of the leaves may be owing to last year's immaturity of the wood, acted on by the natural impulse of spring growth; or perhaps it may be owing to some check, or sudden change to which the trees have been subjected. The spots on the leaves look as if they had been caused by the sun acting on drops of water either on the glass or the leaves themselves. A moderate steady temperature, and careful ventilation, will probably put matters right.

PLANTS FOR CARPETING: W. Plants suitable for carpet or pattern beds, or the carpeting of foliage beds, will be found amongst the following:—Alternanthera amoenca, A. amabilis latifolia, A. magnifica, A. paronychioides major, A. spatulata, A. versicolor, Antennaria plantaginea, A. tomentosa, Amaranthus melancholicus ruber, Coprosma Bauciana, Coleus Verschaffeltii, Calceola tomentosa, Echeveria of sorts, Königia maritima variegata, Kleimia repens, Lamium purpureum aureum, Leucophyton Brownii, Mesebryanthemum cordifolium variegatum, Veronica incana, and Veronica Andersoni variegata. The above-named are best suited for carpet or pattern beds. The following are best adapted for the carpeting of foliage beds:—Ageratum of sorts, Acanthus lusitanicus, Begonia ricinifolia, Coleus of sorts, Centaurea gymnocarpa, Chrysanthemum pinnatum, Geranium amonicefolium, Heliotropes of sorts, Hydrangea hortensis, Ligularia Kämpferii fol. var., Lantana of sorts, Plumbago capensis, and Petunias of sorts.

PRIMROSES: Selborne. Very fine. Many thanks for the bunch—a delightful "sniff" of the country.

ROSES: A. Grant. The "disease" is a fungus—the Rose-rust (Leocythea rosarum).

STRAWBERRIES: G. C. C. C. Sun-scald whilst wet. There is no appearance of disease.

\* Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see. Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

Markets.

COVENT GARDEN, April 29.

An increased supply of Strawberries has been met by increased demand, though buyers have had the advantage. Grapes are more than equal to the demand, and prices are exceptionally low. Trade generally quiet. James Webber, Wholesale Apple Market.

PLANTS IN POTS.—WHOLESALE PRICES.

Table with 4 columns: Plant name, s. d. s. d., and price. Includes Arum Lilies, Azaleas, Bedding Plants, Begonias, Bouvardias, Calceolarias, Cinerarias, Cyclamens, Cyperus, Delytra, Dracena terminalis, Erica, Euonymus, Ferns, Ficus elastica, Foliage Plants, Genista, Lobelia, Mignonette, Myrtles, Palms, Pelargoniums, Ivy-leaved, Roses, Hybrid Perpetual, Spirea, Stocks, etc.

CUT FLOWERS.—WHOLESALE PRICES.

Table with 4 columns: Flower name, s. d. s. d., and price. Includes Abutilon, Anemone, Arum Lilies, Azalea, Bouvardias, Camellias, Carrots, Cowslips, Cyclamens, Daffodils, Eucharis, Euphorbia, Gardenias, Heliotropes, Hyacinths, Lily of the Valley, Mignonette, Narcissus, Pelargoniums, Primroses, Spirea, Tropaeolum, Tuberoses, Tulips, Violets, Wallflowers, White Lilac, etc.

FRUIT.

Table with 4 columns: Fruit name, s. d. s. d., and price. Includes Apples, Cob Nuts, Gooseberries, Grapes, Lemons, Oranges, Pears, Pine-apples, Strawberries.

VEGETABLES.

Table with 4 columns: Vegetable name, s. d. s. d., and price. Includes Asparagus, Brussels Sprouts, Cabbages, Carrots, Cauliflowers, Celery, Chilis, Endive, Garlic, Herbs, Horse Radish, Lettuces, Mint, Mushrooms, Parsley, Peas, Potatoes, Rhubarb, Seakale, Shallots, Spinach, Tomatoes, Turnips.

SEEDS.

LONDON: April 28.—The end of the season being now close at hand, the attendance of buyers on the market to-day was most meagre. As regards American Clover seed the prevalent feeling exhibit its less depression; nevertheless, current prices are still at a lower level, whilst the quality of the seed is finer than has ever before been the case. Other varieties of farm seeds are also surprisingly cheap. Holders of Trefoil are accepting reduced terms. The trade for Lucerne improves. Of Sainfoin and Timothy stocks are at a low ebb. Spring Tares point downwards. Hemp seed realises 31s. per quarter. Canary is neglected. There is a better sale for Mangel seed. Scarlet Runners are dearer; White Runners being remarkably cheap, consequently meet with more attention. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

Trade, though very quiet at Mark Lane on Monday, was somewhat steadier in tone than on Monday evening. As regards Wheat, and indeed all classes of grain, buyers operated with caution. A limited business was done in English Wheat at the rates of last week; foreign met perhaps with rather more inquiry, but with no improvement in value. The Barley trade showed no activity. Malt was quiet and unaltered in price. Oats were only a quiet sale. Maize was dull, at a reduction of about 1s. per quarter as compared with last Monday. Beans were steady; Peas showed weakness; and flour was quiet but steady, the rates of last week being supported.—On Wednesday a dull tone prevailed at market, and any alteration in price was favourable to the consumer. In both English and foreign Wheat prices were inclined to droop. Barley moved off quietly. Oats supported the rates of Monday, but as regards Maize prices had a downward tendency. Beans were firm, Peas were quiet, and no change occurred in flour.—Average prices of corn for the week ending April 24:—Wheat, 48s. 1d.; Barley, 32s. 8d.; Oats, 24s. 11d. For the corresponding period last year:—Wheat, 40s. 11d.; Barley, 31s.; Oats, 20s. 11d.

HAY.

Tuesday's Whitechapel Market report states that the supply of fodder was large, and the trade very dull. Inferior stuff was the turn cheaper. Quotations:—Prime Clover, 100s. to 132s.; inferior, 60s. to 95s.; prime meadow hay, 80s. to 102s. 6d.; inferior, 30s. to 70s.; and straw, 30s. to 38s. per load of 36 trusses.—On Thursday there was a large supply of hay and straw on sale. Trade was dull, and prices unchanged.—Cumberland Market quotations:—Superior meadow hay, 100s. to 108s.; inferior, 50s. to 76s.; superior Clover, 126s. to 132s.; inferior, 84s. to 110s.; and straw, 36s. to 40s. per load.

POTATOS.

From the Borough and Spitalfields Markets reports we learn that good Potatoes continue to move off freely, and prices remain firm. Quotations:—Scotch Regents, 140s. to 160s.; ditto Champions, 180s. to 200s.; Lincoln ditto, 180s. to 190s.; Victorias, 160s. to 180s. per ton. German reds, 4s. 6d. to 7s. 6d.; Dutch rocks, 4s. 6d.; and French whites, 4s. 6d. per bag.—The imports into London last week comprised 34,157 bags from Hamburg, 7180 Danzig, 12,873 sacks, 6780 bags Stettin, 5981 bags Bremen, 7356 Harburg, and 2800 Konisburg, in addition to smaller amounts from other Continental ports.

COALS.

The prices current at market during the week were as follows:—West Hartley, 14s. 3d.; East Wylam, 15s. 6d.; Walls End—Haswell, 10s.; Hetton, 16s.; Hetton Lyons, 14s. 6d.; Hawthorns, 14s. 9d.; Lambton, 15s. 6d.; Wear, 14s. 6d.; South Hetton, 16s.; Tunstall, 14s. 6d.; Chilton Tees, 15s. 6d.; Tees, 15s. 9d.

Government Stock.—The closing price of Consols on Monday was 99 to 98½, for both delivery and the account. Tuesday's final quotation was 99½ to 99½ for delivery and the account. On Wednesday 99 to 99½ were the closing figures for account and delivery. Thursday's leaving off prices were, for delivery, 98½ to 99, and 99 to 99½ for the account.

Verbenas—50,000 Now Ready for Sale. S. BIDE can now supply, as he has done on previous occasions, really good strong spring-struck Plants of Purple, Scarlet, White, and Pink VERBENAS, at 6s. per 100. ## To Nurserymen, Seedsmen, and Florists.

Copy from *London Gazette*, Feb. 27, 1880.

**NOTICE** is HEREBY GIVEN that the PARTNERSHIP heretofore subsisting between Joseph Rains, Marcus Rains, and Morris Isaacs, carrying on business as Dealers in Dutch Flower Roots and Bulbs, at 62, Tenter Street South, Goodman's Fields, Whitechapel, in the County of Middlesex, under the style or firm of M. ISAACS, RAINS AND CO., was DISSOLVED, by an order of the Chancery Division of Her Majesty's High Court of Justice, on November 27, 1879, as from that date.

**MR. MORRIS ISAACS**, for fourteen years the Senior Partner in the above late Firm, will for the future carry on the Business of IMPORTER of DUTCH FLOWER ROOTS, in PARTNERSHIP with his Son, Mr. LEWIS ISAACS, at their New Warehouse, 3, Victoria Warehouses, Mansell Street, Goodman's Fields, London, E.C.

## Flowering Pelargoniums.

**F. AND A. SMITH** have an extensive stock of the above, in best sorts only. Prices (which are low) on application.

The Nurseries, West Dulwich, S.E.

N.B. Also splendid SPIRÆAS and a few CYTISUS.

**STEPHANOTIS FLORIBUNDA** on Sale, very fine plant in tub, trained on flat trellis. Easily removed. Clean, and in robust health. Price £10, or would EXCHANGE for ADIANTUM CUNEATUM. TAYLOR AND CO., Timperley, Cheshire.

## Seed Potatoes.

**MAGNUM BONUM** and **CHAMPION**, the two best disease-resisting Potatoes in cultivation. Stock of the former from Messrs. Sutton, 1879, latter from Scotland. Sample hundredweight bag of Magnum Bonum, 13s., and Champion, 9s. 6d. (sound and true to name), put on Rail on receipt of Post-office order and address.

J. T. SMITH, Potato Merchant, Wisbech, Cambridgeshire.

**PEAS**.—A few bushels for Sale, at 24s., to clear—Little Gem, Dr. Maclean, Prince of Wales. Good samples: true.

THOS. MILNER AND SON, Bradford.

## Uninjured by Frost.

**EVERGREENS**.—In splendid condition for safe removal; having been regularly transplanted and growing in a very exposed situation, are very hardy and robust, thus having withstood the past excessively severe winter without injury.

With reference to the hardy nature of the Trees and Plants reared in these Nurseries, a customer in Yorkshire writes:—"I am very well satisfied with the Roses you sent—the frost has not hurt them, whilst a lot I got from the South have suffered very much."

CATALOGUES on application.

JAS. DICKSON &amp; SONS, "Newton" Nurseries, Chester.

**TWELVE Beautiful and New CALADIUMS**, 21s.; strong plants, about 1 foot high, in 4-inch pots, fit for 8-inch pots at once, selected from twenty finest and most distinct sorts, such as Beethoven, Bellemei, Albert Edward, &c.; carefully packed to travel any distance. Hamper and packing gratis and carriage paid to any railway station in England for cash with order. Dry roots (carriage free), 10s. 6d., 21s., and 42s. per dozen, according to size.

J. H. LEY, Royal Nursery, London Road, Croydon.

## A. LEETE &amp; CO.,

PAINT AND COLOUR MANUFACTURERS, 129, LONDON ROAD, SOUTHWARK, S.E.

## Oil Paint No Longer Necessary.

**HILL AND SMITH'S BLACK VARNISH**, for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in casks of about 30 gallons each, at 1s. 6d. per gallon at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

## UNSOLICITED TESTIMONIAL.

"Pierceland Park, June 21, 1876.—Sirs,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierceland Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE of Fencing, Hurdles, Field and Entrance Gates, &c. sent free on application to

HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 180, Buchanan Street, Glasgow.

## "EUREKA" FUMIGATORS

UPPER GROUND STREET, LONDON, S.E.,

Have the largest and most complete stock in the Trade; upwards of £20,000 worth to choose from.

HOT-WATER BOILERS, PIPES, and CONNECTIONS, And all CASTINGS for HORTICULTURAL PURPOSES.

Their New Illustrated Catalogue, 10th Edition, now ready (price One Shilling).

Hot-water and Hot-air Apparatus erected complete, or the Materials supplied, Price List on application free.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The

plainer sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "grown" Edgings, consequently being much cheaper.

GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.

Agents for LOOKER'S PATENT "ACME FRAMES," PLANT COVERS, and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS. Illustrated Price Lists free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 3s per square yard upwards. Pattern Sheet of Plain or more elaborate Designs, with Prices, sent for selection.

WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability, Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety. Slates, Cement, &c. F. ROSHER AND CO., Brick and Tile Merchants. See Addresses above.

SILVER SAND, fine or coarse grain as desired. Price by post per Ton or Truckload, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post.

FLINTS and BRICK BURRS for Rockeries or Ferneries. KENT PEATS or LOAM supplied at lowest rates in any quantities.

F. ROSHER AND CO.—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

**Hurry's Daisy and Weed Extractor,**  
*FOR LAWNS.*

No one possessing a *Lawn* should be without this wonderfully useful little invention.

(See the *Gardeners' Chronicle* of August 2, 1879.)

**Directions for Use:—**

The "Extractor" should be used as early in the year as possible, in the following manner:—Place the tool over crown of weed, and with a slight twist extract it. The plugs so raised discharge themselves (second pushing out first), and should be replaced UPSIDE DOWN while still fresh. The weed will die, and the grass grow better where this has been done. In using mowing machine after "Extractor" the box should be left off as much as possible, and the grass afterwards well rolled. If these instructions are carried out any lawn may be effectually freed from the obnoxious Plantain and Daisy roots which so often offend the eye. Lawn grass should always be kept short, to avoid the weed seeding.

To be obtained of all Ironmongers and Florists. Price 3s. 9d. only. In Polished Wood, fancy handle, 4s. 6d.

JONES'S IMPROVED EXPANSION JOINT. THE BEST HOT-WATER JOINT.

*Medal Awarded Horticultural Show, Aston, 1875.*

SIMPLE, DURABLE, NEAT, CHEAP. Specially adapted for CHURCHES, SCHOOLS, MANSIONS, PUBLIC BUILDINGS, &c.

Illustrated **CIRCULAR and Price LIST;** also Estimates for Heating with the most improved **BOILERS, EXPANSION JOINT PIPES, or COILS,** on application.

**JONES'S PATENT "DOUBLE L" SADDLE BOILER.**

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increase the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes:—

SIZES.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 in.	18 in.	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1000	16 0 0
24 "	24 "	48 "	1400	20 0 0
28 "	28 "	60 "	1800	25 0 0

Larger sizes if required.

From **Mr. CHARLES YOUNG, Nurseries, Balham Hill, S.W.,** May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

**PRICE LISTS of HOT-WATER PIPES and CONNECTIONS,** with Boilers, of all sizes and shapes; or **ESTIMATES for HOT-WATER APPARATUS,** erected complete, will be sent on application.

**J. JONES and SONS,** Iron Merchants, 6, Bankside, Southwark, London, S.E.

Two Gold Medals awarded to us by the Royal Horticultural Society, at the

Grand Show at Preston, July, 1878, out of Fourteen Competitors.

Having extensive works, special machinery, and first-class workmen, who have been many years in the trade, we are able to supply the very best class of buildings at an extremely low price. As we are the only firm in the kingdom that has ever been awarded *Two Gold Medals* by the Royal Horticultural Society, this will be some proof of the quality of our productions. Our buildings are constructed so as to combine great strength, simplicity, and durability, with extreme lightness, and being made of the very best materials, with ordinary care, *last a lifetime*. The ventilators at top and bottom open the whole length with one handle to each series. The glass used is 21-oz. British sheet, and the paint the best *genoue* white lead and oil. HEATING APPARATUS, with thoroughly *reliable* Boilers supplied and fixed in the most practical and efficient manner, and guaranteed to work economically and answer its purpose in all seasons. We devote special personal attention to this branch of our business, and have never had a *failure*.

Plans, Estimates, and Catalogues free. Customers waited on in any part of the Kingdom.

WANTED, at ONCE, an active, intelligent young man, of good address, as ASSISTANT SHOP-MAN.—State age, experience, wages, &c., to CRANSTON'S NURSERY and SEED COMPANY (Limited), King's Acre, Hereford.

WANTED, on a Gentleman's Estate, a steady man as PAINTER and GLAZIER. Good house and garden. Age 30 to 35.—C. W. MORWOOD, Canwell Hall Gardens, Tamworth, Staffordshire.

WANT PLACES.

IMPORTANT NOTICE.—Advertisers are cautioned against having Letters addressed to INITIALS, or to FICTITIOUS NAMES at Post-offices, as Letters so addressed are not taken in, but are sent at once to the Returned Letter Office.

DOWNIE AND LAIRD can at present recommend with every confidence several first-rate SCOTCH GARDENERS, whose character and abilities may be thoroughly depended upon, either for Large Establishments or Single-handed Situations; also FOREMEN, UNDER GARDENERS, and FARM BAILIFFS.—17, Frederick Street, Edinburgh.

GARDENER (HEAD).—Age 25; practical in every branch of Gardening. Five years' good character from present employer.—GARDENER, Rectory, Lydlinch, Blandford.

GARDENER (HEAD); age 36, married.—A GENTLEMAN would be glad to recommend his Head Gardener, a thorough practical man. Over nine years' character.—J. F., 97, Deane View, West Melton, Rotherham.

GARDENER (HEAD).—Age 32, married; nineteen years' practical experience in all branches. Orchids, Pines, Vines, and General Management of a Gentleman's Garden.—KENNARD, Beechlands, Caterham Valley.

GARDENER (HEAD), where two or more are kept.—Fifteen years' character—eight years as Head Gardener. Satisfactory reasons for leaving last situation.—GARDENER, Sissinghurst Place, Staplehurst, Kent.

GARDENER (HEAD).—Married, no children.—First-class recommendations. Plants, Fruits, and the general Management of a good Garden.—J. MACDOUGALL, 2, Leventon Place, Kentish Town Road, N.W.

GARDENER (HEAD).—Mr. DELL would be pleased to recommend his Foreman, Thomas Brown, to any Lady or Gentleman in want of a steady industrious man. Understands the profession in all its branches.—Patsull Gardens, Wolverhampton.

GARDENER (HEAD), where one or two more are kept.—Age 29; no incumbrance. Understands Stove and Greenhouse Plants, Vines, &c.; Flower and Kitchen Gardening.—J., 2, Alfred Cottages, George Street, Sutton, Surrey.

GARDENER (HEAD), to any Lady or Gentleman requiring a thoroughly practical man.—Age 32, married, one child. Good reference to last employer.—W. W. WALTER, 2, Washington Terrace, White Hart Lane, Barnes, Surrey.

GARDENER (HEAD), where two or more are kept.—Age 36, married, no family; has a practical knowledge of all branches of the profession, including Orchids. Eight years' good character.—M. WOOD, Camdeo Wood, Chislehurst, Kent.

GARDENER (HEAD), where a thorough practical energetic man is required.—Age 32, married; twenty years' experience in all branches of the profession. Also Land and Stock if required. Nearly five years with late employer, by whom he is highly recommended. Near London preferred.—GARDENER, The Lea, Esher, Surrey.

GARDENER (HEAD); age 32, married.—A £10 Bonus will be paid to any Gardener or Nurseryman who may be the means of assisting the Advertiser into a good place as above. Thoroughly practical in all branches of the profession, and capable of Managing an extensive place. First-class testimonials and excellent character from last situation.—Z., 43, Azemby Square, Lyodhurst Road, Peckham, S.E.

**GARDENER (HEAD);** age 32.—**J. GROOM,** The Gardens, Linton Park, Maidstone, can confidently recommend a young man, who served four and a half years under him at Henham Hall, Suffolk, and has been for the last six years General Foreman, to any Lady or Gentleman requiring a good practical Gardener.—Apply as above, or to **W. W.,** Napoleon Cottage, West Drayton, Middlesex.

**GARDENER (HEAD).—RICHARD TAYLOR,** The Gardens, Byram, Ferrybridge, Yorks, can with every confidence recommend his Foreman to any Lady or Gentleman requiring a thorough practical Man. Four years in present situation, and eight years' excellent character from other places, including Wollaton Hall, Notts, and Shipley Hall, Derby.

**GARDENER (HEAD).—£5 Bonus** will be given to any one who will obtain a situation for an elderly respectable man. He has a thorough knowledge of Gardening in every department, and can be highly recommended, as also for the Management of Woods, Plantations, and Land (if required). Has had great experience in Removing large Trees and Shrubs. A great salary not required.—**B. E. W.,** 24, Forston Street, Hoxton, N.

**GARDENER (HEAD, WORKING).—Twenty-three years' practical experience** in England and Scotland. Six years in last situation.—**MACDOUGALL,** Granard Lodge, Putney Park Lane, Putney, London, S.W.

**GARDENER (HEAD, WORKING),** where three or more are kept—Age 35; thoroughly competent in all branches. Wife understands poultry. Excellent recommendations.—**G. W.,** 102, Mayhall Road, Brixton, London.

**GARDENER (HEAD, WORKING),** where assistance is given.—Age 30, married; good practical knowledge of Gardening in all its branches.—**G. H.,** Rose Cottage, Compton Gifford, Plymouth.

**GARDENER (HEAD, WORKING),** where one or more are kept.—Age 45, married; two children; nine years' good character from present employer.—**H. P.,** Havering, near Romford, Essex.

**GARDENER (HEAD, WORKING).—First-class Plant and Vegetable Grower.** Seventeen years in last situation. Character will bear the strictest investigation.—Apply to **HEATH AND SON,** College Nurseries, Cheltenham.

**GARDENER (HEAD, WORKING),** where three or more are kept.—Age 34, married, no family; thoroughly practical and proficient in all branches of the profession. Three years' excellent character.—**T. B.,** Post-office, Ide Hill, near Sevenoaks, Kent.

**GARDENER (HEAD, WORKING).—Age 33, married; thoroughly competent.** Twenty years' practical experience in all branches of Gardening. No single-handed place accepted. Highly recommended. State wages, &c.—**J. BRISTOW,** Perran-ar-Warthal, Cornwall.

**GARDENER (HEAD, WORKING),** where more are kept.—Age 32, single; seventeen years' good practical experience in all branches of the profession. Three years' good character.—**T. FUNNELL,** 71, Warden Road, Kentish Town, London, N.W.

**GARDENER (HEAD, WORKING).—Age 39, married, two children; understands the profession** in all its branches. Land and Stock if required. Two and a half years' good character from last place.—**C. W.,** 5, Chestnut Terrace, Forest Gate, near Stratford, Essex.

**GARDENER (HEAD, WORKING),** where others are kept.—Middle-aged, no family; twenty-four years' thorough practical experience in all branches. Could Manage a little Land. Seven years' good character from last place, and references.—**T. MAY,** Waterloo Villa, Cosham, Hants.

**GARDENER (HEAD, or good SINGLE-HANDED).—Age 26; twelve years' experience** in all departments in both Noblemen's and Gentlemen's establishments. Good testimonials.—**S. A.,** 23, Pomona Place, King's Road, Fulham, W.

**GARDENER (HEAD, or good SECOND),** in a large establishment, where a thorough knowledge of Plant Growing is required.—Age 37, married, three children. Excellent references.—**The GARDENER,** The Hall, Norwood Green, Middlesex.

**GARDENER.—A GENTLEMAN** wishes to recommend his Gardener, who has been with him twelve years, to any one requiring the service of a thorough practical persevering man, well up in all branches.—**ALPHA,** Ibbstone, Tetworth, Oxon.

**GARDENER.—Well experienced in Stove, Vines, Cucumbers, and Flower and Kitchen Gardening.** Will be at liberty May 8. Good character from present and previous employers.—**S. W.,** 32, Coombe Road, Wells Road, Sydenham, S.E.

**GARDENER (good SINGLE-HANDED, or otherwise).—Age 40; first-class testimonials, extending over many years.** To live in lodge or otherwise. Wife to Manage Poultry, &c.—**W. M.,** J. Noble, The Nurseries, Lower Clapton, E.

**GARDENER (SINGLE-HANDED, or where a boy is kept).—Age 33, married, three children; no objection to a cow.**—**H. GREGORY,** Wigginton, Tring, Herts.

**GARDENER (SINGLE-HANDED, or where help is given).—Age 25.—J.,** Mrs. Abbiss, Stationer, Streatham Common, London, S.W.

"By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—*Civil Service Gazette.*  
**EPPS'S COCOA. GRATEFUL AND COMFORTING.** **JAMES EPPS AND CO.,** HOMŒOPATHIC CHEMISTS.

**"OLD DR. JACOB TOWNSEND'S" SARSAPARILLA. THE BLOOD PURIFIER.** This extraordinary Medicine has a singular influence upon the blood, which it enriches and purifies. It removes all pimples and blotches, purifies the system, and acts like a charm. As a sustaining and purifying tonic it is invaluable, and highly recommended in long-standing cases of indigestion, nervousness, coughs, colds, scrofula, gout, dropsy, and wasting of flesh. Sold by all druggists. Caution.—Get the red and blue wrapper, with the Doctor's head in the centre. No other genuine. In bottles, 2s. 6d., 4s. 6d., and 11s.—131, Fleet Street, E.C.

**DINNEFORD'S MAGNESIA.** The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for **ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION,** and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA. HOLLOWAY'S PILLS** are the medicine most in repute for curing the multifarious maladies which attack humanity, when wet and cold weather gives place to more genial temperatures. In short, these Pills afford relief, if they fail of being an absolute remedy in all the disturbances of circulation, digestion, and nervous energy, which at times oppress a vast portion of the population. Under the wholesome, purifying, and strengthening powers exerted by these excellent Pills, the tongue becomes clean, the appetite improves, digestion is quickened, and assimilation rendered perfect. Holloway's medicine possesses the highly estimable property of cleansing the whole mass of blood, which, in its renovated condition, carries purity, strength, and vigour to every tissue of the body.

## "THE COVENTRY" LAWN MOWER

(REGISTERED). MANUFACTURED BY

### NETTLEFOLD & SONS,

54, HIGH HOLBORN, LONDON, W.C.

The attention of the Public is invited to "THE COVENTRY" LAWN MOWER, which can be confidently recommended as the best and cheapest in the market; for lightness and ease in working it cannot be surpassed.

It has all the improvements which have of late been introduced into this class of Machine, either in England or America. It will cut wet or dry grass of any length, will turn in its own width, and is so light that a lady can use a 15-inch Machine of this make with greater ease than a 10-inch of the ordinary kind.

It is cheaper than any other Machine of its class before the public.

It is made, as its name implies, at Coventry, by skilled English workmen, and of best English Steel and Iron.

These Machines can also be supplied with rollers at same price, and with Grass Boxes at a small extra cost.

SALES BY AUCTION.

Catford.

Unreserved Sale, by order of the Executors.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, Park House, Southend, Catford, Kent, on WEDNESDAY, May 10, at 1 o'clock precisely, the whole of the STOVE and GREENHOUSE PLANTS—5 fine grown specimen Camellias and Azaleas, 2000 Bedding Plants in variety; capital Farm Cart and Effects.

May be viewed. Catalogues had on the Premises, and of the Auctioneers and Estate Agents, 93, Gracechurch Street, E.C., and Leytonstone, E.

Postponement of Sale.

MESSRS. PROTHEROE AND MORRIS beg to announce that the SALE of ORCHIDS advertised to take place on Monday next is POSTPONED UNTIL MONDAY, MAY 24.

Catalogues had at the Auctioneers' Offices, 93, Gracechurch Street London, E.C.

Established and Imported Orchids.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, May 10, at half-past 12 o'clock precisely, a quantity of plants of the beautiful and rare DENDROBIUM JAMESIANUM, just received from Borneo, where it grows at an altitude of 4000 feet in a cool temperature; added to the beauty of its flowers, the length of time they last makes it a desirable species in every collection. A quantity of plants of DENDROBIUM LUTEIFLORUM. This is the beautiful Burmese variety, just received from Borneo in good condition. Also several small collections of ESTABLISHED ORCHIDS, consisting of Odontoglossum vexillarium, O. crispum, O. triumphans, and others; Angraecum sesquipedale, Cypripedium, &c., in variety supposed to be new.

May be viewed the morning of Sale, and Catalogues had.

New Cypripediums.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on TUESDAY, May 11, without the least reserve, two apparently new CYPRIPEDIUMS, with beautifully marked leaves; also a fine importation of CYPRIPEDIUM STONEL, all in excellent condition.

May be viewed the morning of Sale, and Catalogues had.

Odontoglossum vexillarium Lehmanni, Rchb. f. ODONTOGLOSSUM ALEXANDRE LEHMANNI, Rchb. f. See Professor Dr. Reichenbach's description in the Gardeners' Chronicle.

MR. J. C. STEVENS has received instructions from Mr. F. Sander, St. Albans, to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, May 12, at half-past 12 o'clock precisely, a splendid lot of the above two new ODONTOGLOSSUMS. The plants are in extra fine condition.

Dried flowers and drawings on view day of Sale, and Catalogues had.

Epidendrum vitellinum majus in flower.

MR. J. C. STEVENS has received instructions from Mr. F. Sander, St. Albans, to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, May 12, at half-past 12 o'clock precisely, a quantity of extra-sized plants of this beautiful ORCHID in bloom; its vivid colour and great durability of flower make it specially attractive and valuable.

May be viewed the morning of Sale, and Catalogues had.

Cattleya labiata speciosissima varieties.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, May 12, at half-past 12 o'clock precisely, by order of Messrs. Hugh Low & Co., a grand lot of the above-named lovely CATTLEYAS, which produce on short stout bulbs flowers in great profusion, as can be abundantly seen on inspection of the specimens offered. The flowers are usually 7 to 8 inches in diameter, three, and four on a spike; sepals and petals delicate rose-purple; lip very large, front portion bright amethyst, with white and yellow markings. The plants are extremely varied in appearance, the labiate type predominating; and all without exception are splendid masses, many with 20 to 50 bulbs; they are well furnished with green healthy leaves, and altogether exceptionally fine.

On view the morning of Sale, and Catalogues had.

Valuable Importations of Orchids.

MR. J. C. STEVENS has received instructions from the New Plant and Bulb Company, Colchester, to SELL by AUCTION at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, May 13, at half-past 12 o'clock precisely, several splendid importations of ORCHIDS, consisting of the beautiful Oncidium superbiens, Odontoglossum hastulatum, Oncidium ohyrium, Maxillaria venusta, &c.; Dendrobium Fytchianum, D. formosum giganteum, D. Freemannii, D. densiflorum, Vanda ornata, Aerides Lobbi, Saccolabium Blumei, S. gemmatum (rare), &c.; also Oncidium Marshallianum, O. dasylette, O. Gardnerianum, O. Forbesii, O. phymatichilum, O. crispum grandiflorum, Laelia Peruvian, Zyclopetalum maxillare, &c.

May be viewed the morning of Sale, and Catalogues had.

Specimen Stove and Greenhouse Plants, &c.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, May 10, at half-past 12 o'clock precisely, a fine collection of Specimen STOVE and GREENHOUSE PLANTS, including many fine varieties of Ferns, Palms, Anthuriums, Marantas, &c., many of them having taken Prizes at the various Horticultural Shows in Kent; also a collection of ESTABLISHED ORCHIDS, many of them in flower, including fine specimens of Odontoglossum vexillarium, O. Andersonianum, O. triumphans, O. gloriosum, Dendrobium, &c.

May be viewed the morning of Sale, and Catalogues had.

The Collection of Established Orchids formed by the late J. B. Cockerell, Esq., of Cheshunt.

MR. J. C. STEVENS has received instructions from the Executrix to offer for SALE by AUCTION, without the least reserve, on THURSDAY and FRIDAY, May 20 and 21, at half-past 12 o'clock precisely each day, the entire COLLECTION of COOL and other ORCHIDS, named by the late J. B. Cockerell, Esq., comprising beautiful specimen plants of Odontoglossum Alexandre, triumphans, vixillum, Andersoni, &c.; Masdevallia Veitchii, Hanyama, Lucidum, &c., all nice healthy plants; Cattleya Maritima, labiata, lobata, Trianae, Mossie, &c.; Dendrobium Warocum, crassifolium, nobilis, and other good varieties; Oncidium, Calanthe, Epitridium, &c.

May be viewed the morning of Sale, and Catalogues had.

MR. J. C. STEVENS has received instructions from the Executrix to offer for SALE by AUCTION, without the least reserve, on THURSDAY and FRIDAY, May 20 and 21, at half-past 12 o'clock precisely each day, the entire COLLECTION of COOL and other ORCHIDS, named by the late J. B. Cockerell, Esq., comprising beautiful specimen plants of Odontoglossum Alexandre, triumphans, vixillum, Andersoni, &c.; Masdevallia Veitchii, Hanyama, Lucidum, &c., all nice healthy plants; Cattleya Maritima, labiata, lobata, Trianae, Mossie, &c.; Dendrobium Warocum, crassifolium, nobilis, and other good varieties; Oncidium, Calanthe, Epitridium, &c.

May be viewed the morning of Sale, and Catalogues had.

MR. J. C. STEVENS has received instructions from the Executrix to offer for SALE by AUCTION, without the least reserve, on THURSDAY and FRIDAY, May 20 and 21, at half-past 12 o'clock precisely each day, the entire COLLECTION of COOL and other ORCHIDS, named by the late J. Cockerell, Esq., comprising beautiful specimen plants of Odontoglossum Alexandre, triumphans, vixillum, Andersoni, &c.; Masdevallia Veitchii, Hanyama, Lucidum, &c., all nice healthy plants; Cattleya Maritima, labiata, lobata, Trianae, Mossie, &c.; Dendrobium Warocum, crassifolium, nobilis, and other good varieties; Oncidium, Calanthe, Epitridium, &c.

May be viewed the morning of Sale, and Catalogues had.

Important Collection of Established Orchids.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on TUESDAY, May 11, at half-past 12 o'clock precisely, a COLLECTION of ESTABLISHED ORCHIDS, the property of W. S. Gore Langton, Esq., M.P., of Newton Park, Bristol, comprising many of the finest plants and varieties in existence. Amongst them will be found Saccolabium guttatum, Loddige's var., which plant gained the Veitch's Memorial Medal, June 24, 1873, at the Horticultural Exhibition at Bath; three fine specimens, such as Dendrobium fimbriate; Aerides Lindleyana; fine specimen and splendid variety; Angraecum sesquipedale superbum; Cattleya Skinneri, five new growths; Dendrobium densiflorum; Aerides Fieldingii and Lobbi; Cattleya Bigas; Odontoglossum Ruezlia, Vanda swavis, Veitch's var., Vanda tricolor, a splendid large variety; Vanda insignis, Camarotis purpurea, Aerides affinis majus, Phalenopsis amabilis and Schilleriana, and many other valuable sorts.

May be viewed the morning of Sale, and Catalogues had.

Cattleya Mossiae and its varieties.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, May 19, at half-past 12 o'clock precisely, a large importation of CATTLEYA MOSSIAE and its varieties, just arrived from South America in good condition, many of them in magnificent masses that would make good exhibition plants; the leaves are as fresh on most of these Cattleyas as if they had only travelled a few miles. C. Mossiae, being one of the most beautiful of Cattleyas and so easily grown, is especially worthy of notice.

May be viewed the morning of Sale, and Catalogues had.

Highly Important Sale of Established Orchids. MR. J. C. STEVENS has received instructions from W. Turner, Esq., Over Hall, Winsford, Cheshire, to offer for SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, June 2, and following days (instead of the days previously announced), at half-past 12 o'clock precisely each day, without the least reserve, the entire COLLECTION of ESTABLISHED ORCHIDS. Amongst other grand things will be found Laelia Warneri, Saccolabium Turneri (spikes nearly 2 feet long), Cattleya Skinneri alba, C. Morganii, C. Wagneri, Laelia Williamsi, and many other rare and valuable plants.

May be viewed the morning of Sale, and Catalogues had.

FOR IMMEDIATE DISPOSAL, in consequence of the death of Proprietor, an old-established NURSERY and SEED BUSINESS in Warwickshire, in full working order, with every facility for doing a large trade.—For particulars address M. W., 3, Duingannon Terrace, North End Road, Waltham Green, London, W.

Grange Nursery, Heaton Mersey, near Manchester. TO BE DISPOSED OF, by Private Treaty, Grange Villa, Heaton Mersey, with the site thereof and adjoining Land used as a Nursery, and containing together by admeasurement 14,520 square yards or thereabouts. The house comprises Dining, Drawing and Breakfast-rooms, with Kitchen, Scullery, Six Bed-rooms, Dressing-room, Water-closet, and Store-room, and is Cellared throughout. The Outbuildings consist of Stabling for Three Horses, Coach-house and Harness-room, with large Loft and Store-cupboard, Cow-house, Piggeries, Pigeon-house, and Hen-house. There is a Greenhouse attached to the house. On the land there is erected a range of Glass 225 feet long, consisting of Vineries, Ferery, Greenhouse, and Propagating Pit. There are materials on the ground requisite for erecting another Range of Glass, the foundations for which are already laid. There is a good Stock of Rose Trees, Shrubs, Fruit Trees, and other Plants, Flowers, &c. The Premises have for some time been used as a Nursery by the late proprietor, Mr. Thomas Studd deceased, and are replete with every convenience for carrying on the Business of a Nurseryman. The situation is healthy, and the premises command an extensive view of the Derbyshire Hills, Alderley Edge and Bowdon.

The Premises can be inspected on application at the House, and any further information can be obtained from Mr. W. R. MINOR, Solicitor, 26, Brown Street, Manchester.

Special Notice.—To Florists, Nurserymen, &c. MR. JOHN EMBLETON, Suffolk House, New Hampton, is favoured with instructions to SELL by Private Treaty about 60 Acres of FREEHOLD LAND, well adapted for the above requirements.—Apply as above.

J. T. DEANE, LANDSCAPE GARDENER.—

Planting by Contract or Otherwise, Ornamental Lakes, Rockwork, &c. References kindly permitted to Noblemen and Gentlemen—places already carried out. Plans and Estimates furnished.—Wellesley House, Wellington Road, Orpington, Kent.

New LIST of Roses in pots, Clematis, &c., post-free. The Nurseries, Bath.

To Nurserymen, Seedsmen, and Florists. Copy from London Gazette, Feb. 27, 1880.

NOTICE is HEREBY GIVEN that the PARTNERSHIP heretofore subsisting between Joseph Rains, Marcus Rains, and Morris Isaacs, carrying on business as Dealers in Dutch Flower Roots and Bulbs, at 62, Tenter Street South, Goodman's Fields, Whitechapel, in the County of Middlesex, under the style or firm of M. ISAACS, RAINS AND CO., was DISSOLVED, by an order of the Chancery Division of Her Majesty's High Court of Justice, on November 27, 1879, as from that date.

MR. MORRIS ISAACS, for fourteen years the Senior Partner in the above late Firm, will for the future carry on the Business of IMPORTER of DUTCH FLOWER ROOTS, in PARTNERSHIP with his Son, Mr. LEWIS ISAACS, at their New Warehouse, 3, Victoria Warehouses, Mansell Street, Goodman's Fields, London, E.C.

Uninjured by Frost.

EVERGREENS.—In splendid condition for safe removal; having been regularly transplanted and growing in a very exposed situation, are very hardy and robust, thus having withstood the past excessively severe winter without injury. With reference to the hardy nature of the Trees and Plants reared in these Nurseries, a customer in Yorkshire writes:—"I am very well satisfied with the Roses you sent—the frost has not hurt them, whilst a lot I got from the South have suffered very much." CATALOGUES on application. JAS. DICKSON & SONS, "Newton" Nurseries, Chester.

Verbenas—50,000 Now Ready for Sale.

STOCKS.

The best varieties only. Price 1s. per packet, post-free. SUTTON AND SONS, The Queen's Seedsmen, Reading.

New Japanese Azalea.

AZALEA ROSIFLORA.—This beautiful species, which is now offered for the first time, differs from every other Azalea in cultivation. The flowers in the bud resemble those of a miniature Tea Rose, whilst as they expand they regularly imbricate like those of a Camellia. These qualities, combined with the fact that it does not fall off, render it invaluable for coat flowers, bouquets, as well as for exhibition and general decorative purposes. It is compact and free in growth, and much branched; colour deep-rosy-red. First size, 6 inches high, some in flower, 10s. 6d. Second size, 6 to 9 inches high, some in flower, 21s. Third size, 1 foot high, many in flower, 31s. 6d. WM. HUGH GOWER (Manager to the late Wm. Rollinson & Son), The Nurseries, Tooting, S.W.

Valuable Plants, Carriage Paid.

PELAGONIUMS.—ZONAL, new and choice, 30s. per 100, 5s. per dozen. GOLDEN TRICOLORS, in fine variety, 4s. per dozen. SILVER TRICOLORS, in choice new sorts, 5s. per dozen. Older varieties, 4s. per dozen. SILVER-EDGED Fancy-flowering varieties, 4s. 6d. per dozen. BRONZE, choice, in fine variety, 4s. per dozen.

DAHLIAS in all the best kinds, 3s. 6d. per dozen, or 21s. per PHLOX, all the best, at 3s. 6d. per dozen. TUBEROUS BEGONIAS, 5s. per dozen. The above are all first-class varieties and true to name, cash with order to CHARLES BURLEY, Brentwood.

**PHLOX DRUMMONDI GRANDIFLORA.**

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN,  
LONDON, W.C.

## CATTLEYA LABIATA SPECIOSISSIMA VARIETIES.

**MR. J. C. STEVENS** will SELL by AUCTION, at his Great  
Rooms, 38, King Street, Covent Carden, W.C., on WEDNESDAY, May 12, at half-past  
12 o'Clock precisely, by order of Messrs. HUGH LOW & Co., a grand lot of the above-named  
lovely CATTLEYAS, which produce on short, stout bulbs, flowers in great profusion, as can be  
abundantly seen on inspection of the specimens offered. The flowers are usually 7 to 8 inches in  
diameter, three and four on a spike; sepals and petals delicate rose-purple; lip very large, front  
portion bright amethyst with white and yellow markings. The plants are extremely varied in  
appearance, the LABIATA type predominating; and all, without exception, are splendid masses,  
many with twenty to fifty bulbs. They are well furnished with green, healthy leaves, and  
altogether exceptionally fine.

*On view the morning of Sale, and Catalogues had.*

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN,  
LONDON, W.C.

## VALUABLE IMPORTATIONS OF ORCHIDS.

**MR. J. C. STEVENS** has received instructions from The New  
Plant and Bulb Company, Colchester, to SELL by AUCTION, at his Great Rooms,  
38, King Street, Covent Garden, W.C., on THURSDAY, May 13, at half-past 12 o'Clock  
precisely, several splendid importations of ORCHIDS, consisting of the beautiful **ONCIDIUM  
SUPERBIENS,** **ODONTOGLOSSUM HASTILABIUM,** **ONCIDIUM OBRYZATUM,**  
**MAXILLARIA VENUSTA,** &c.; **DENDROBIUM FYTCHIANUM,** **D. FORMOSUM  
GIGANTEUM,** **D. FREEMANNI,** **D. DENSIFLORUM,** **VANDA CERULEA,**  
**AERIDES LOBBI,** **SACCOLABIUM BLUMEI,** **S. GEMMATUM** (rare), &c. Also  
**ONCIDIUM MARSHALLIANUM,** **O. DASYTYLE,** **O. GARDNERIANUM,** **O. FORBESII,**  
**O. PHYMATOCHILUM,** **O. CRISPUM GRANDIFLORUM,** **LÆLIA PERINNII,** **ZYGO-  
PETALUM MAXILLARE,** &c.

*May be viewed the morning of Sale, and Catalogues had.*

LONDON, W.C.

# LANDSCAPE GARDENING.

## R. H. VERTEGANS, F.R.H.S.,

Is able to point to many successful instances of the

### LAYING OUT OF GARDENS,

which have been designed and executed by him in various localities. He has long made a SPECIAL STUDY of this department of his business, and has in his employ competent Draughtsmen, Foremen, and a Staff of Workmen thoroughly accustomed to the Work; and is thus enabled to undertake the Laying-out of Gardens of any size, LARGE OR SMALL, to furnish Plans or Designs suited to varied situations and surroundings, and to carry them out quickly and economically.

In a recent competition for a Design for converting the old Wolverhampton Racecourse into a Public Park for Wolverhampton, there were twenty-seven Competitors, and R. H. V.'s Design was awarded the

### FIRST PRIZE OF £50.

He is now engaged in carrying this Design out at a cost of £5000. But he desires to point out to his connection and the Public generally, that though he is able to undertake the Formation and Planting of Parks, Cemeteries, and Public Grounds of any dimensions, he has had very large experience in Laying-out Suburban Gardens of all sizes, from such as are attached to small Villas, to others of considerable extent surrounding Mansions, and he has the pleasure of knowing that he has invariably succeeded in giving entire satisfaction to those who have employed him. He therefore confidently solicits the favour of being allowed to submit Plans and Estimates to Gentlemen who are about making new Gardens, or remodelling old ones, and he will do so promptly, and at as reasonable a cost as the work will admit of.

CHAD VALLEY NURSERIES, EDGBASTON, BIRMINGHAM.—May 4.

## WEEDS, AND HOW TO DESTROY

THEM—Gentlemen can have the Weeds, Moss, &c., Destroyed on their Garden Walks, Carriage Drives, &c., without disturbing the gravel, by watering them with a solution of SMITH'S WEED KILLER, a liquid preparation destructive to all vegetable growth. It merely requires mixing with cold water, and is applied with an ordinary watering-can. Four gallons of the concentrated solution make 100 gallons of Weed Killer. Price 7s. 6d., carriage paid to any railway station.

W. RICHARDS, 41, WELLINGTON STREET, STRAND, W.C.

NEW YELLOW FRENCH MARGUERITE,  
CHRYSANTHEMUM ETOILE D'OR.

Awarded a First-class Certificate by the Floral Committee of the Royal Horticultural Society  
on the 13th ult.

A splendid Conservatory Plant, blooming profusely all the year; flowers  
excellent for cutting.

Equally adapted for Bedding in the Flower Garden in Summer.

Now being sent out, 24s. and 36s. per dozen.

W. HOWARD,  
FLORIST, SOUTHGATE, LONDON, N.

Orders to be accompanied by a Cheque or Post-office Order.

CHOICE PELARGONIUMS  
FOR SPRING, 1880.

## PELARGONIUM VOLUNTE NATIONAL.

I have great pleasure in recommending this beautiful decorative Pelargonium, as being one  
of the most distinct, free flowering, and best habited plants ever sent out. As a Decorative Plant,  
or for Cut Flowers, it is invaluable.

Awarded a First-class Certificate by Royal Horticultural Society, July 8, 1879.

Price, 3s. 6d. each, Strong Flowering Plants.

" 2s. 6d. each, Small Plants—Free by Post.

Coloured Plates free to Customers when one dozen and upwards are ordered.

Pelargonium Lucie Lemoine. Pelargonium Madame Charles Konig.

Both of these varieties are pure white, of great substance, free and continuous bloomers.

Will be very valuable for Cut Flowers.

2s. 6d. each.

## SEMI-DOUBLE-FLOWERED PELARGONIUMS.

ALBA PERFECTA.—Pure white flowers, very dwarf and free flowering. Will prove one of the  
very best white bedders, as the flowers have no shade of pink in them.

EMILE DE GERARDIN.—Soft bright rose-pink, very dwarf and free flowering.

LA NUBIEN.—Deep fiery crimson, very free flowering.

The above three semi-doubles are very distinct, and quite new in colour, and will be invaluable  
to cut from—in fact, would make a lovely bouquet by themselves.

Plants 2s. 6d. each. Usual Trade Price.

ONE PLANT of EACH, PACKAGE or POST-FREE, for 12s. 6d.

POST-OFFICE ORDERS TO

FREDERICK PERKINS, NURSERYMAN,  
37, REGENT STREET, LEAMINGTON.

By Royal Letters Patent.

**RITCHIE'S GAS LIGHTING and HEATING APPARATUS.** Specially adapted for Drying Newly-built Houses. Silver Medal awarded in 1878 at Wolverhampton Exhibition. The deleterious and unpleasant vapours arising from the burning of ordinary coal gas are prevented from escaping, and are made to circulate within the Apparatus or Stove in such a way that they become thoroughly condensed, and are carried off in the form of a liquid, in which will be found the sulphur and other poisons which are drawn from and would in the ordinary way be left in and mixed with the surrounding atmosphere; consequently health is not prejudicially affected, Works of Art, Plants, Pictures, Books, Furniture, &c., are not injured, and the atmosphere is rendered uncontaminated and perfectly healthy. No Flue required. Prices from 50s. to £10 10s.—Full particulars and testimonials forwarded on application to RITCHIE AND CO., 23, St. Swithin's Lane, London, E.C.

To Nurserymen and Others.  
**TO BE SOLD, a Bargain, a splendid lot of GREENHOUSE HOT-WATER PIPES, BOILERS, &c. Apply, J. SMITH, Hargwyne Street, Stockwell, S.W.**

**"THE GARDEN" POTTERY.**—Your pots are the best.—Mr. PAYNE, Gr. to the Rt. Hon. and Rt. Rev. the Lord Bishop of Bath and Wells. Works:—Chilcompton and Evercreech Junction Stations. Address:—T. J. HICKES, Shepton Mallet.

**WATERPROOF TREE and PLANT LABELS,** specially adapted for Garden Purposes. They stand all weathers, and by using our Prepared Pencil the writing cannot be effaced, and remains discernible at all times. For sample and price apply to the Manufacturers, FISHER, CLARK AND CO., Boston.

SEND FOR A PRICE LIST OF

# JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

*For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions,  
Fountains, Farms.*

No Cost for Motive-Power, which is obtained from the Stream of Water passing through the Rams.

No Oiling or Packing Required.

Made in sizes to raise from 300 to 500,000 Gallons per day.

This Advertisement will appear  
again on May 29.

This Ram for small working falls.

This Ram will force a part of the same water that works it, or will force clean water from a well or spring whilst worked by a stream of impure water. Rams on this principle can be supplied to force to a height of 1500 feet.

This Ram, for deep working falls, will force up one-third of the water passing through it

This Advertisement will appear  
again on May 29.

*Parties requiring a Water Supply should not too readily conclude that the quantity and fall of water, if any is available, is too small to work a Ram before consulting J. B.*

## TESTIMONIALS.

From the Right Honourable the EARL of GRANARD, *Castle Forbes*, March 7, 1880.—“The Hydraulic Ram erected for me at Castle Forbes has answered perfectly. Considering the very small fall attainable by the nature of the ground, it is a great success, and throws up water to a cistern on the top of a tower 80 feet high. When Mr. Blake first proposed to put it up I doubted the possibility of its succeeding, owing to the nature of the ground, but I have been most agreeably undeceived.”

From Col. TREMAYNE, *Perran-a-Worthel, Cornwall*, March 7, 1880.—“The Self-acting Hydraulic Ram you erected here about two years ago is, I am pleased to say, working most satisfactorily, sending up water at the rate of 8000 gallons to a height of 185 feet, and a distance of more than 2000 yards. The quantity of water is as much as you undertook to deliver.”

From W. SCARTH, Esq., *Agent to His Grace the Duke of Cleveland*.—“Raby Castle, Darlington, July 16, 1878.—The Hydraulic Ram you supplied to his Grace the Duke of Cleveland in 1875 is a complete success. It worked for more than two years without once stopping, and throws more water than promised.”

From JOHN TAYLOR, Esq., *The Rocks, Bath*, August 22, 1878.—“The Self-acting Hydraulic Ram you fixed here in March of last year continues to work well. It has only the same quantity of water and fall to work it as the water-wheel and pump which I used previously to force a height of 204 feet, and yet the Ram sends up more than double the quantity of water that the wheel did to the same height.”

From Major STARRIE, *Lovely Hall, Blackburn*, May 13, 1878.—“Sir, I have great pleasure in testifying to the good qualities possessed by the Ram you erected here last year. It has done its work well, and not failed as the other Ram did, which was of a different construction, and supplied by a different firm. I consider that there are great difficulties to contend with here, but your practical mechanical knowledge, both as to the construction of the Ram and its situation here, overcame most of the difficulties that we had to contend against.”

From JOHN PENNINGTON, Esq., *Emmott Hall, near Colne*, December 21, 1868.—“Sir.—The Self-acting Hydraulic Ram you supplied me with nine months ago continues in excellent condition. It receives water from a spring through a 2-inch pipe, of which it forces 3600 gallons per day of twenty-four hours to a height of 90 feet, exceeding all you promised, and far surpassing the water-wheel and force-pumps which it has displaced. Its cost is small, it occupies but little space (2 square feet), and in mechanical detail is simplicity itself. I have much pleasure in recommending it as a cheap and efficient method of raising water.”

This view represents one Ram worked by water from a spring, and forcing it up to a Farm, Cattle Troughs, Kitchen Garden, and Mansion, all at different elevations, the highest being 444 feet, and to a distance of 2008 yards.

## TESTIMONIALS.

From Capt. GANDY, *Castle Bank, Appleby*, February 11, 1880.—“The Self-acting Hydraulic Ram you erected for me is an excellent example of strength and good workmanship. Whilst working with 3 feet 4 inches fall it forces water 73 feet high, and so far gives me every satisfaction. It will do more work in one day than the old Ram of another make could do in a week.”

From JOHN WALKER, Esq., *Mount St. John, Thirsk*, February 13, 1880.—“In reply to your enquiry I am glad to inform you that the Hydraulic Ram you fixed here in May last has fully answered my expectations, and your promises as to the quantity of water it would force to a height of 185 feet. I consider it a very good machine, and superior to one I had in use previously.”

From Captain TOWNSEND, *Wincham*, February 10, 1877.—“In answer to your inquiry, I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe, 900 yards long, at the rate of 80,000 gallons per day, although you only promised 50,000.”

From the Right Hon. T. SOTHERON-ESTCOURT, *Estcourt Park, Gloucestershire*, September 6, 1875.—“You will be glad to hear, as I am to tell you, that your Self-acting Hydraulic Ram has worked exceedingly well and continuously since it was erected, more than twelve months ago. It is, in fact, perfectly successful.” (The delivery pipe in the above case is 4200 feet long, with 100 feet rise.)

From Deane Water, *Wiltshire*, November 25, 1873.—“Dear Sir,—In answer to your inquiries respecting the Hydraulic Ram you supplied me with six months ago, I beg to state that I am more than satisfied with it, as it is in perfect order, sending up to the top of the house about 2000 gallons of water in the twenty-four hours, whereas you only contracted to deliver in that time 500 gallons. I have, therefore, every reason to be well pleased with your work, and more especially as I had a Ram supplied me by another maker which could not send up a single gallon of water to the height required, and a second maker informed me that no Ram with a fall of 3 feet could send up water to the distance required—namely, 120 feet. But yours is an accomplished fact, and does its work most effectually.—Yours, &c., L. HANMER.”

From Mr. THOMAS MASON, *Alkincoates Hall, Colne*, September 30, 1871.—“Sir,—Your Self-acting Hydraulic Ram gives me entire satisfaction; it has been at work about fifteen months, and has only been seen once during the last six months; it is forcing about 1400 gallons per day of twenty-four hours, to a height of 194 feet.

JOHN BLAKE, ENGINEER, ACCRINGTON, LANCASHIRE.

Is now recognised by practical men throughout the United Kingdom as the best Manure that has ever been manufactured.

This Manure is composed of highly concentrated animal matter, and is entirely different from Guano, Nitrate of Soda, and all Chemical Manures, which are merely stimulants, and in the end exhaust and deteriorate the soil. It is really a Plant Food, and all Crops appear to benefit in a most remarkable manner from its application. It is now being used most successfully

- For all Farm Crops,
- For all Kitchen Garden Crops,
- For Lawns and Flower Gardens,
- For Vines and Strawberries,
- For Melons and Cucumbers,
- For all Soft-wooded Plants,
- For all Stove and Greenhouse Plants,
- For Camellias, Azaleas, and Gardenias.

FRANCES JANE HOPE.

THE announcement of the sudden death of this lady, on the 26th ult., at her residence, Wardie Lodge, near Edinburgh, will be received with dismay and sorrow by those who were privileged to know this enthusiastic plant-lover. Her plants were her pets, but in cherishing them she employed discrimination and tact amounting almost to genius. Her taste in selecting plants was only equalled by her skill in cultivating them. By her a plant was grown for the sympathy and interest it excited. It was not the mere brilliancy of a bedding plant, nor the formal symmetry of a florist's flower, that attracted her attention. Her appreciation was wider and deeper. She had all a botanist's love of flowers without his pedantry. Most generous in giving information and in sharing her treasures with any one who had similar tastes to her own, she was not without a vein of sly satire. Such a plant was called by such a botanist by this name, by another a different name was applied—a third had called it so and so; all these names, those of the plants and of those by whom the names were given, were registered on the tally. A visit to her greenhouses was in this way not a wholly unalloyed pleasure to those who happened to be "tallied" in the manner we have mentioned. There was always the excuse of "synonyms" to take refuge behind, albeit the lady was quite keen enough to be able to weigh its validity! Miss Hope was, to a large extent, her own gardener. That goes without saying: not many gardeners possessed her knowledge of plants—very few have equal zeal and interest in them. To very many gardeners the garden is everything, the plants are mere accessories. This was not Miss Hope's way of viewing things; for her the garden existed for the plants, not the plants for the garden. It was this spirit which led her to affix a conspicuous announcement to a bed of Hellebores, or what not—"This bed is not to be dug." How many of us there are who will sympathise with the feeling that prompted that injunction.

Another characteristic of Miss Hope was her taste in arranging flowers, her fertility of resource, her originality of conception, her daring combinations. It is impossible to convey an adequate idea of these on paper. Although she herself frequently contributed hints on this very subject to our columns, it was only by personal inspection that the art and learning she displayed in these arrangements could be appreciated.

Miss Hope was the youngest daughter of Mr. James Hope, Writer to the Signet, and niece of Dr. Thomas Hope, Professor of Chemistry and Pharmacy in the University of Edinburgh, to whom Wardie Lodge then belonged, and who, in his leisure hours, indulged a taste for plants, which he inherited, no doubt, from his father, James Hope, M.D., Professor of Botany in the University of Edinburgh—a

man justly eminent in his day as a teacher of that science, and who, to show his respect for the great Linnaeus, erected a tablet, which is still standing in the Botanic Garden, bearing this inscription :—

LINNEO  
POSUIT.  
J. Hope.

The branch of the old family of Hope from which Miss Hope was sprung is that of the Hopes of Craighall and Pinkie, now represented by Sir Archibald Hope, Bart. Miss Hope leaves behind her two brothers, Writers to the Signet, one, Mr. John Hope, being justly eminent for his great services and the much good he has done in the cause of temperance.

The same spirit of benevolence which characterised her brother influenced his now departed sister in many beneficent acts unostentatiously done. Her love of plants was throughout most notable, and its ardour was so strong that she thought little of a trip to Aberdeen to secure some much desired Hellebore, a tribe of plants of which she was passionately fond, and of which she possessed a greater number of species than could be found in many public gardens. With a great love for all herbaceous plants she was, like many more of the present day, passionately fond of all bulbous things. Many fine old plants, now lost and neglected in many places where they should be found, she rescued from oblivion. She was great in interchanges, and many amateurs all over the kingdom will, says Mr. I. Anderson-Henry, to whom we are indebted for some of the particulars now given, read with deep regret the sad intelligence of her demise when still in middle life.

The Rector of Market Deeping writes :—

"I should like to add my testimony to the loss all lovers and growers of flowers have sustained in the death of Miss Frances Jane Hope, of Wardie, near Edinburgh. She was no ordinary person. Inheriting a love of botany from her uncle, the celebrated Dr. Hope, she was not so much a botanist as a gardener. To her it was a greater pleasure to cultivate her flowers and make them happy than to classify and dissect them. Her garden was the great interest of her life. She was up early and at work late in it—working as hard as her men, and doing everything much better than they. She spared no pains to add to her collection, and had visited every nursery garden of importance in England and Scotland. Her heart was open to flowers of all sorts. She loved even those which others thought dull and unattractive, and discovered beauties in them. No plant was despised by her, and she made use of the meanest as well as the noblest. In winter, for example, she would fill her beds with common curly Kale of many shades. Thus her garden was as suggestive as most gardens are commonplace. Many visited it and drew inspiration from it. Her drawing-room, with its large window overlooking the sea, was adorned each week with fresh combinations of flowers arranged with untold thought and study, and she would mix with perfect taste the humblest leaves and flowers of the field with choice exotics, and rare greenhouse plants and mosses. So kind and true a friend was seldom seen. Long before the days of 'flower missions' her flowers found their way to many a hospital and sick room. She grew certain sweet-smelling herbs on purpose for posies for the poor of Edinburgh. Her bright handsome face will long be missed. Many a one, both in England and Scotland, as he walks round his garden, will point sadly to some choice plant and say, 'I got that from dear Miss Fanny Hope.' No lady that I have ever known or heard of was so good a gardener or loved flowers so well."

Another friend writes :—

"That kind old lady, Miss Hope, of Wardie, is dead," was the exclamation at our breakfast-table to the grief of all who heard it. You must allow me to add a small stone to her cairn. She was not only a valued correspondent, but it was one of the pleasures of my year, on the way home from farther North, to pay a visit to her most inviting garden, where her warm kindly welcome and the way she went over her favourites one by one made the day a very pleasant one, while the constant 'Would you like it?' made it sometimes difficult to admire aloud. She had the true gardener's love of plants for their own sakes free from any question of ownership. I could see this well last year when I had the pleasure of going with her carefully through the gardens here. In

my wild wood garden is a bed—one of the most successful ones—called Miss Hope's bed, in which every plant was given me by her. As one beautiful flower after another comes out it will call up a pleasing recollection of a valued lost friend. *George F. Wilson.*"

## New Garden Plants.

MESOSPINIDIUM INCANTANS, n. sp.\*

When I had the delight of seeing the Orchid collection at Burford Lodge, some particular curiosities excited my highest interest. There was a fabulous Orchid, unseen before, which enchanted me with its extraordinary leaves, oblong ligulate acute, white with very numerous green nerves, so as to appear greenish-grey at a certain distance. What could it be? Was it not some new *Odontoglossum*, surpassing *Roezlii* and the king of *Odontoglossums*, the bluish mauve *vexillarium* itself? Was not its history marvellous enough! Certain Indians, whether simply brown ones or belonging to the rare greenish-brown variety is unknown, brought the plant with a lot of *vexillarium* to one of the Klabocho. On June 27, 1878, the poor creature came under Mr. Stevens' hammer. Having had the good luck to find a resting place at Box Hill in one of those Orchid palaces, it ultimately flowered. Alas! Marvellous as the flowers are for the botanist, they would not secure a First-class Certificate at South Kensington. They remind me of the flowers of the green *Odontoglossum ramosissimum*, though those are much superior in the good opening of the blossoms. Sepals and petals ochre-coloured, with brown blotches. Lip white, with ochre-coloured callus and many small brown dots. Column white with some mauve spots. I have to thank Sir Trevor Lawrence for a full-grown living plant and a very good panicle with beautiful mauve peduncle. I give the name in allusion to the fascinating effect the plant made on every one who saw it. It was as much the object of expectation as that plant of *Phalenopsis Schilleriana* at Consul Schiller's before it flowered. *H. G. Rehb. f.*

ODONTOGLOSSUM VEXILLARIUM LEHMANNI,  
n. var.

This is a curious variety, which would appear to deserve a special name, judging from rich dried specimens at hand. The plant is rather small. The wild flowers, up to seven in a raceme, are light rose, very large in proportion to the size of the plant. The inferior sepals bear each three dark stripes. The white area around the yellow base is striped. It was found by our excellent friend, Mr. F. C. Lehmann, in the Andes of Western South America. *H. G. Rehb. f.*

DENDROBIUM LITUIFLORUM (Lindl.) CANDIDUM.

This is a lovely variety, with white flowers, whose young growth lacks likewise the purple marking. It is apparently one of the uniques of the celebrated collection at Burford Lodge. *H. G. Rehb. f.*

## A PARK FOR WOLVERHAMPTON.

NOWHERE in England are open breathing spaces—recreation-grounds, parks, play-grounds, &c.—more needed than in populous manufacturing districts, such, for instance, as that central portion of the Midland Counties which is known in current phrase as "the Black Country." Sanitary science has opened the eyes of most people to the value and importance of fresh air; and as a love of outdoor exercises has spread little by little, so it has dawned on the minds of our leading men that it is part of their duty to provide the people with suitable places close to their homes where they may be indulged in. We are glad to be able to congratulate Wolverhampton on having followed the example set by Birmingham (which now has seven distinct parks) by providing its inhabitants with a public recreation-ground.

Since 1825, and until very recently, annual races have been held on a fine open space close to the heart of the town, and within the borough boundaries, belonging to the Duke of Cleveland. The racecourse,

for something like fifty years, was held by lease, and was under the management of a committee. As the term of the lease approached its completion, it became known that the land would no longer be available for a racecourse. Negotiations were then opened with the Duke's agent by the then Mayor (Samuel Dickinson, Esq.), which ended in a most liberal offer being made by the noble owner to lease to the town, for a period of sixty-three years, 50 acres (the larger portion) of the racecourse, at the nominal rental of £300 per annum, with right of purchase at the end of that term for the sum of £20,000 (£400 per acre). This offer was submitted to the Corporation at a special meeting held in September, 1877, and after a lengthy debate was accepted by a majority of twenty-eight, six only voting against it. In March, 1879, the Park and Baths Committee advertised in our columns for designs for laying out this land as a public park, and premiums of £50 and £25 were offered for the best and second best designs respectively, an express stipulation being that the premiated designs could be carried out for a sum not exceeding £5000.

Twenty-seven designs, accompanied by specifications and detailed estimates, were sent in by the 31 of May last. After careful examination the design bearing the motto "Spe labor levis" was awarded the first prize, and on opening the accompanying letter it was found to be the work of Mr. R. H. Vertegans, of Chad Valley Nurseries, Edgbaston, Birmingham, and Great Malvern. At a meeting of the Town Council in July last, the award was confirmed, and Mr. Vertegans' tender to carry out the works for the sum of £5000 was accepted. This successful prize design we have now the pleasure of submitting to our readers at p. 593 (fig. 103).

The instructions and conditions issued on behalf of the Corporation by the Borough Engineer and Surveyor (Mr. G. Eastlake Thoms, C.E.), for the guidance of the competitors, stipulated that of the area 8 to 10 acres should be laid out as a lake or lakes. The positions of the entrances to the park were fixed by the committee, and the designer had to arrange the walks accordingly. The whole area, it was provided, should be efficiently drained into the lakes, and ample space, covering altogether 10 to 12 acres, was to be provided for volunteer drill, archery, cricket, and bowling grounds. Sites were also to be set apart for two entrance lodges, refreshment rooms, shelters, and other conveniences. The designer, it will thus be seen, was somewhat hampered by a number of conditions dependent on local circumstances and requirements, to which must be added that the flatness of the site and the unpicturesqueness of its surroundings were more or less difficulties to be borne in mind, dealt with, and, if possible, overcome. The area was not only flat but treeless, waterlogged, and more or less boggy. On the other hand, the soil over the greater part of the plot is of a kind well adapted, when properly drained, for the growth of many sorts of trees and shrubs. The larger part of the area is covered with 18 inches to 3 feet deep of a mixture of good loam and peaty soil, while in another part the ground is much heavier in texture.

Mr. Vertegans entered on the work of laying out the park early in September last, and has made such satisfactory progress that it is expected the whole will be completed in about three or four months. At the time when we paid a visit to the park, early in the month of April, we found the low boundary wall finished in some parts and in progress elsewhere. This wall will be surmounted by handsome iron palisades. The entrance pillars, &c., were in course of erection. At present the lodges are not begun, but we saw the designs for them prepared by the Borough Surveyor, and were much pleased with them; they are handsome though not expensive, and more commodious and convenient than such buildings often are. But the surveyor is not only an engineer but an artistic architect, and he seems to have remembered while he was designing his plans that it was as needful to provide for the comfort of the occupants as the pleasure of the spectators. And here it may not be out of place to point out, as an example worth copying, the admirable manner in which Mr. Thoms has utilised the exterior of the park for the public convenience. On reference to the plan it will be seen that a wide road (60 feet wide) encircles it. This road has for its entire length been separated into three divisions: the one nearest the park, 17 feet broad, for a ride for equestrians; the centre, 28 feet broad, for carriages and other vehicles;

\* *Mesospinidium incantans*, n. sp.—Pseudobulbis minutis ellipticis compressis; foliis cuneato-oblongo ligulatis acutis, albis, densissime viduato-veis; panicula expansa, merito bene evoluto; sepalis impari formato oblongo ligulato acuto, sepalis paribus alte comatis apice bidentatis; tepalibus ligulatis falcatis acutis, labello oblongo pandurato acuto apice reflexo, callo in disco basilari pandurati-formi limbo elato, pilis infimis transversis; columna utrumque medio angulato.—Ab affini *M. Warszewiczii* cum foliis, tum labello satis superque distat. Neo Granada. Col. ill. Trevor Lawrence. *H. G. Rehb. f.*

the remaining 15 feet for foot passengers. Outside this road a sufficient depth of land remains for the erection of villa residences surrounded by suitable gardens. As this must in the nature of things become a favourite spot for residences of the better class, the park will eventually be entirely surrounded by good houses and gardens, the effect of which, if planted with taste, will be to enhance that produced by the park itself. The length of the road around the park is about 1 mile.

So far as the work of laying-out the park is already done, Mr. Vertegans' design comes out admirably, and it seems abundantly clear that when the work is finished the park will be a really handsome one, with a nicely undulated surface, while the arrangement of the walks in combination with the planting will produce the illusion of a much greater area being occupied than is contained within the boundaries. Much thought has been bestowed on the planting, for the situation is too close to an always smoke-laden district to hope for success with all sorts of trees and shrubs. Care has been taken to ascertain the kinds which are already known to thrive in the neighbourhood, and to these other hardy sorts have been added which there is reason to expect will do well. The total number of trees, shrubs, &c., set down in the specification to be planted is close on 20,000, and as the information may be useful to others who may have to plant parks in manufacturing districts, we subjoin details of the kinds which are being used at Wolverhampton. Of evergreens there will be more than 14,000: these consist of *Arbor-vitæ*, *Aucuba japonica*, *Box*, green and variegated; *Cotoneaster microphylla* and *C. Simonsi*, *Cupressus Lawsoniana*, *Pinus sylvestris*, double *Furze*, *Hollies*, green and variegated; *Laurel*, *colchic*, common, and *Portugal*; *Pinus austriaca*, *Privet*, evergreen and *P. ovalifolium*; *Rhododendron ponticum*, and other mixed hybrid varieties; *Berberis Aquifolium*, and 1000 other evergreen trees and shrubs to be selected by the superintendent. Of flowering trees and shrubs there will be between three and four thousand, including white flowering *Acacias*, *Almonds*, *Broom*, white and yellow; *Elders*, variegated, &c., and *Forsythia viridissima*, *Guellder Roses*, purple-leaved and other *Hazels*, *Laburnums*, *Scotch and English*; *Lilacs* in variety, *Ribes sanguineum* and other varieties; *Spiræas*, of sorts, *Sweet Briars*, *Philadelphus grandiflorus*, *Thorn*, crimson and white; *Weigelas*, and 500 ornamental deciduous trees and shrubs of kinds to be selected by the superintendent. There will also be about 1500 deciduous forest trees, including *Mountain Ash*, *Weeping Ash*, *Alder*, *Beech*, *Chestnut*, scarlet and white; *Elm*, *Scotch and Wheatley's*; *Weeping Elms*, *Hornbeam*, *Limes*; *Poplars*, *Lombardy*, *Ontario*, *Black Italian*, and *argentea*; *American Weeping Willow*, &c. These ornamental forest trees will be used largely in the formation of avenues; the main one, from south to north, being of *Limes*, two of *Chestnuts*, one of *Mountain Ashes*, one of *Chestnuts* and *Norway Maples*, one of *Norway Maples* alone, and one of *English* and *Huntingdon Elms* alternately, while the walks around the lakes will be planted with *Poplars* of various kinds, *Turkey Oaks*, *Sycamores*, *Purple Beeches*, &c. *Planes*, it will be observed, have not been mentioned, nor will they be used, as they do not flourish in this locality.

The circle of beds around the central space, which will eventually be occupied by refreshment rooms and shelters, it is intended to define and intersect with *Ivies*, *Box*, or other dwarf growing plants, a 3-foot margin being reserved for spring and summer bedding plants, annuals, herbaceous plants, &c., so as to afford scope for a cheap display of flowers. The centres of these beds will be permanently filled with *Rhododendrons*, hardy *Heaths*, *Azaleas*, *Gaultherias*, *Pernetias*, *Ledums*, *Vincas*, *Berberis* of sorts, and other suitable plants. The other beds and borders generally, judging by those already completed, will be furnished no less satisfactorily, while from among the trees and shrubs mentioned above with *Pampas-grass*, *Arundo conspicua*, &c., a fitting selection will be made to plant the islands and the margins of the lakes.

The contract specifies that all the work is to be finished and the park handed over to the Corporation by the 1st of December next, but judging by the forward condition of the work at the time of our visit, and the speed with which everything seemed to be pressed forward, there is every reason to expect that Mr. Vertegans' sanguine expectations will be realised, and the park be finished three months earlier than the

stipulated time. The whole of the planting will be completed early in May. It will be an agreeable task to visit this park again a few months hence, when all the work is finished, and we will then inform our readers how far the promise of excellence given by the parts already done has been kept. *Philanthes*.

## EXHIBITION PLANTS AT HENWICK GRANGE.

THE growing of specimen plants, such as may be seen in the highly-cultivated examples met with at the leading horticultural exhibitions, forms one of the many departments that go to make up the total of gardening as it at present exists in this country. There are some who argue that the plants as necessarily trained for these competitions have too much formality in their appearance. When we take into account the difference in their nature, and the widely varied management required to grow a collection of hard-wooded plants really well, and the years of patient watchfulness and study needed to enable the cultivator to master the treatment needed by each species—the fact that inattention for a single day is often enough to destroy a plant that has taken a considerable number of years to bring it up to the mark—it will, at all events, be admitted that the cultivation of these plants is a fitting field to bring out the first essentials to successful gardening. These may be summed up as consisting of attention, observation, and perseverance. The sun of fashion for hard-wooded plants is just now in a fog; but no doubt in the course of its revolution will return, unless gardeners have lost the pride that they used to take in being able to grow things that required more skill than just sticking a plant right end up in a pot, and giving a soaking of water at intervals. There is one thing indisputable—that is, if hard-wooded flowering plants were absent, the exhibitions would be as sombre in appearance, and a little more interesting, than a field full of Turnips.

If asked to point to the best grown collection of hard-wooded subjects in the country, I should have no hesitation in naming that belonging to J. F. Greswolde Williams, Esq. Not but that there may be others comprising greater numbers, but what the Henwick Grange collection may lack in quantity is fully made up by their fine condition. They include quantities of beautiful young thriving examples of *Heaths*, *Azaleas*, *New Holland* and other greenhouse plants, *Ixoras*, *Dipladenias*, *Allamandas*, *Anthuriums*, besides *Ferns*, *Palms*, *Cycads*, and fine-foliaged subjects generally. Amongst *Ericas*, which are represented by most of the best varieties, there is a very fine plant of *E. elegans* some 3 feet through and 2½ feet high—a complete sheet of bloom, fast assuming its bright pink colour. This is now a very scarce *Heath* in any size, and is a slow grower, but not so liable to die as some kinds. *E. ventricosa coccinea* minor, similar in size, its dense green shoots set at every point with buds. *E. Victoria*, equal in size to the above; this is one of the hand-omest spring flowering varieties, and is one of the best-constituted of the dark-coloured sorts. *E. ventricosa magnifica*, 4 feet in diameter, in beautiful health, promising well for bloom; this is another fine *Heath*, one of the brightest in colour when skilfully managed. *E. ventricosa superba* is equal to the preceding in every way. *E. mirabilis*, a little less than the last, but equally full of advancing flowers. The major variety of *E. Massoni*, one of the most distinct and handsome of the whole family, 3 feet through. *E. ampullacea obbata*, one of the best of the *Heaths* with flask-shaped flowers, 3 feet through. Several varieties of *E. tricolor*. *E. Parmentieri*, an immense dense bush, green and vigorous, not less than 5½ feet through, such a plant as has rarely been seen. Of late summer flowering kinds there are *E. Austriana* and *E. Irhyana*, both handsome specimens, and amongst the best of the later blooming sorts.

*Azaleas* are equally well represented by the best of the established kinds that have been long enough in existence to admit of having attained full specimen size; they are thoroughly furnished with plump flower-buds—a condition not by any means general this spring with plants that bloomed late last season, a circumstance no doubt attributable to the sunless low temperature of last summer. Conspicuous in a number of other hard-wooded subjects was an unusually fine plant of the largest variety of *Aphelaxis macrantha rosea*, with a full crop of advancing bloom; and an equally fine example of *Pimelea mirabilis*.

*Ixoras*, *Dipladenias*, and *Allamandas* have each a small house to themselves, where they are stood well up to the roof. The *Ixoras* include very fine specimens of the hybrids *Williamsii*, *Dixiana*, and *amabilis*, and several of the old species *coccinea*, still the best of all the family, but a plant that few now appear able to grow well. The large specimen of the best variety of *Anthurium Scherzerianum*, so often exhibited, is in grand health, and has grown to an enormous size. Standing near it was far the largest plant of the white variety of this plant that I have seen. It is over 2 feet in diameter, with above a hundred leaves. As it attains age and size the flowers get larger. In another house I saw a stout young plant of the scarce *A. Scherzerianum Wardii*, bearing a couple of its very large broad flower-spates.

One of the best features present in the plants mentioned, and scores of others of a like character at this place, is that they are furnished to the pots with healthy wood, well clothed with foliage. The natural habit of far the greater portion of the hard-wooded section of plants used for exhibition is that of a low spreading bush, with leaves down to the base; and when, as pot plants, they are bare and naked at the bottom, they are deficient in one of the first essentials requisite in a well-grown specimen. Some individuals who exhibit, and many more who look on at the shows, question why such or such a collection is placed before another, composed of plants that are fair to the eye so far as their heads go, but will not bear the close scrutiny necessary to fairly assess the merits of the competing groups.

Amongst *Palms*, many of which are large growers, and in excellent condition, there are several of the very best, as well as most elegant and distinct; of these *Geonoma gracilis* is a beautiful example, contrasting well with the broad massive leaves of *Pritchardia pacifica*, *Geonoma princeps*, *Kentia australis*, the now well-known *Leopoldinia pulchra*, and others of equal merit.

*Ferns* comprise the best of the tree species—*Gleichenias*, *Davallias*, *Adiantums*, and other favourite kinds.

As I have already intimated, the above are not a title of the many fine things contained in the collection which gives evidence of Mr. Tudgey's plant-growing abilities, and I have no doubt that he will be found in the van through the coming summer's exhibition campaign. *T. Baines*.

## A SAND DISTRIBUTOR.

THE desirability of superseding manual labour by some simple and efficient mechanical means in distributing sand or ballast over the surface of roads when rendered slippery either by frost, or, in the case of asphalt, by moisture, has long been experienced. The want has now been met by Chambers' sand-distributing machine, which has just been publicly tried on the Thames Embankment in the vicinity of the Chelsea Suspension Bridge. The machine is constructed upon the principle of the manure-distributor, which is well known to agriculturists. It consists of a box or hopper in which the supply of sand is carried, and upon which the driver's seat is placed. Beneath the hopper is a horizontal cylinder, having ribs formed upon it at intervals. This cylinder is made to revolve by gearing in connection with one of the travelling-wheels of the machine, which is mounted on a pair of wheels, and drawn by a light horse. Under the cylinder is a screen through which the sand or ballast passes, thus completing its separation, and insuring its uniform distribution on the roadway. The ballast first passes from the hopper, in which irregularity of delivery is prevented by a reciprocating stirrer—and, falling on to the revolving cylinder, is delivered in a thin stream into the screen through which it falls vertically on to the ground. The cylinder is kept clean by a system of spring scrapers. The quantity of ballast delivered can be regulated by the driver by means of a slide attached to the hopper, and the supply may be greater or less according to requirement. The supply of ballast in the hopper is calculated to last on an average for about a mile of travel of the machine. The machine was made to the order of Mr. George Livingstone, the surveyor to the parish of St. George, Hanover Square, subject to his approval on the trial, which was made recently in the presence of a number of other district surveyors, and which proved in every way successful. The action of the machine was almost noiseless, and the spread of the ballast was perfectly regular and uniform. The width of the spread being confined within the width of the machine, no annoyance or hindrance is occasioned to passing traffic. The manufacturers are Messrs. Richard Garrett & Sons, of the Leiston Works, Suffolk. *Times*.

JAPANESE CONIFERS.—X.

(Continued from p. 363.)

THUYA (MACROTHUYA) STANDISHII.\*—We have little to add to what has been before said with reference to this plant, whose history we gave at p. 397, vol. x., 1878.

We have now an opportunity of giving a woodcut of the cones (fig. 102), from which it will be seen that the plant is a true Thuya. Maximowicz' name of japonica has to some extent the right of priority, but, for garden purposes at least, it must cede to the name given by Gordon, inasmuch as there are already two, if not more, plants called Thuya japonica in gardens, and which have been taken up in various printed lists, and even in Parlatores' Monograph. Since our former article on this plant the new part of Messrs. Bentham and Hooker's *Genera Plantarum* has been issued, in

The species we have now to deal with belongs to the section Macrothuya, and is of the more interest as being so nearly allied to *T. gigantea* of North-west America as to have been confounded with it. The differences are alluded to in the previous article.

Up to recently *T. Standishii* had only been found in a cultivated condition in the gardens of Japan, but Mr. Maries met with it wild on the mountains of Central Japan mixed with *Thuyopsis dolabrata*. The idea that this plant is the same as the N.W. American *T. gigantea* must therefore be abandoned. As things go the two plants are quite as distinct as other species of Thuya. There is no evidence to show whether, as some think, the plant was originally introduced from America to Japan; all that we are justified in saying is, that the Japanese is the "representative" form of the American. *T. Standishii* is a hand-

of shades from dark crimson to the most delicate rose. One is as well imbricated as a Camellia, with several rows of concentric petals, and very large; another a splendid large single, with a blotch like that of Comtesse de Beaufort. Most of those from the seed of Ed. de Walle are crimson or rose, and nearly all double, very large and vigorous; and here let me state that it has long been a desideratum with me to obtain Azaleas with strong vigorous foliage. This is easily done by using as parents those of this character, and of which the de Walle is one.

On Saturday last we celebrated the fortieth anniversary of the Massachusetts Agricultural Club. It was to all a beautiful and interesting occasion—friends, flowers of female loveliness, baskets of Orchids, &c., presented a brilliant spectacle, and were I not past fourscore I should look forward to the next fortieth with longings for a renewal of the

FIG. 102.—THUYA STANDISHII.

which the genus Thuya is made to include as sections:—

- § 1. Euthuya, in which only two of the scales of the oblong cone are fertile; seeds winged, 2—3 to each scale. *Thuya occidentalis*.
- § 2. Macrothuya, in which 4—6 of the scales of the oblong cone are fertile; seeds winged.
- § 3. Thuyopsis, with globose cones and 4—8 fertile scales, each with 4—5 winged seeds—*e. g.*, *Thuyopsis dolabrata*.
- § 4. Biota, with subovoid cones, with 4 fertile scales, and 2—3 wingless seeds. *Biota orientalis*.
- § 5. Chamæcyparis (= Retinospora), with globose cones, 4—6 fertile scales, each with 2 winged scales.

some Conifer, quite hardy, and one which no collection should be without. *M. T. M.*

Foreign Correspondence.

BOSTON, U.S.A.: April 20.—I am pleased with what is said of Mr. Carmichael's seedling Azaleas, and I concur with him in the belief that we shall be able to produce by hybridisation a race of Indian Azaleas that will prove hardy even in our inclement climate. The *Azalea mollis* is as hardy as an Oak with me, and I see no reason why it may not be used as a parent for this purpose; in fact, I have a few small plants produced by the pollen of the mollis on the Indian variety, and which have stood the winter by being covered with leaves. My crosses on the A. Edward de Walle, alluded to by Mr. C., as also by its pollen on others, are truly fine; some of them are magnificent in flower and foliage (see sketch enclosed) [Very fine. EDS.], being very brilliant, and

same. The big Camellias of which I wrote two years since are flourishing like a green Bay tree. I enclose a leaf of the old Camellia Floyii, the original plant, 13 feet high, head 7½ feet broad, over fifty years old, and for which I gave 250 dollars in 1839. It is an American seedling, sometimes called Grand Frederick. Mrs. Abby Wilder, original plant, 13½ feet high, by 7 feet wide in head, forty-five years old. One Double White, nearly 14 feet high, whose stem is 23 inches near the base in circumference; over sixty years of age. *Marshall P. Wilder*.

A ROBIN REDBREAST'S NEST.—That the apparently amiable but really pugnacious little robin not unfrequently selects odd places in which to build its nest every gardener knows, but we very much doubt if many gardeners have seen a redbreast's nest in the centre of a plant of *Adiantum farleyense*, yet such is the position in which one of these birds has pitched its tent in the stove at Summerhill, Pendleton, the residence of Wm. Agnew, Esq., M.P.

## Florists' Flowers.

**GREENHOUSE FLORISTS' FLOWERS.—AZALEAS.**—Some of our largest specimens that have not been subjected to more than a greenhouse temperature are now in flower. Probably the rather warm weather in March and April brought them on much faster than usual. In ordinary seasons the same plants would probably not be in flower for a month later. The small specimens, with stems about a foot high, and not too closely tied in, are well adapted for placing on side stages. To keep the flowers in good condition for as long as possible it is necessary to shade rather closely, and during such high east winds as we are getting now the ventilators must not be opened too freely. As the plants pass out of flower, the seed-pods must be picked off, and the plants placed in a heated house where they can be freely syringed and well watered while they are making their growth. Put any that may require it, using good fibrous peat.

### BECONIAS.

The culture of these plants is very simple. They do well in a warm house if early flowers are wanted, or they do equally well as we have them, in quite a cool frame. Under the latter conditions they are growing quite freely, and to prevent lanky growths we air abundantly, as well as keep the plants close to the glass. Good fibrous loam, a little rotten manure, and leaf-mould seems to be the most suitable soil for them.

### BOUVARDIAS.

The principal object in view at present is to maintain a vigorous growth, and this can be best attained by keeping the plants in a house where they can have a little heat with a moist atmosphere. Our plants became rather stunted last year, owing to some check while they were making their growth, and that seems to have had an effect on the cuttings this year. They were not strong, and took longer to form roots; now, however, the small plants have been potted separately into small pots, and they are making very fair growth. When the weather is better they will be placed in a cooler house, to which air will be freely admitted.

### CALCEOLARIAS.

As these are now coming into flower, it is necessary to fumigate the house thoroughly to destroy greenfly, or even if none are observed it is best to fumigate, as they may be there, and will soon spread, to the utter destruction of the beauty of the plants. Weak manure-water may be given about twice a week. The plants like a rather moist atmosphere, and a good supply of water at the roots. Pour the water in carefully without wetting the leaves. Shade the plants from the sun with thin scrim or tiffany.

### CHINESE PRIMULAS.

We sow our seeds rather early, and the young plants are now up; they will be pricked out in a few days, about six in a 3-inch pot. They will soon gather strength, and when the leaves meet together each may be potted singly in a small pot. The plants become stunted in growth if they are exposed to the direct rays of the sun; it is best to place them in a frame with its back to the south or that is shaded in some way from the sun. Plants in these small pots are often injured by careless watering. I use a small water-pot, and avoid wetting the leaves.

### CINERARIAS.

The flowering period is over for this season. A few late-flowering plants may still produce a few cut flowers, but the finer varieties selected to propagate from should be placed in a frame that is shaded in the way recommended above for Primulas. The plants will start from the base, and as soon as the young growths are large enough they should be taken off, and potted singly in small pots. Seedlings should be potted off as advised for Primulas, but they require rather more space. Handle the plants carefully, and water gently with a fine syringe to settle the soil round the plants. All young seedling plants require careful treatment at first until they have fairly started into growth; and during such cold weather as we are now experiencing, with east winds blowing keenly, water must be kept from the leaves. It is as well to water the plants in the morning at present.

### CYCLAMENS.

The plants have now done good service, and are going out of flower. The best varieties should be

placed aside to save seeds from. It is best to place them on shelves near the glass in a greenhouse. Other plants will be passing into the resting period. Some persons place their plants in a cold frame and take very little pains with them, but they must still be looked to. So much water at the roots is not required now, but the drying-off system is a grievous mistake. Enough water must be applied to keep the leaves in a healthy state. The very old corms may be thrown away, to be succeeded by younger and better varieties.

### FUCHSIAS.

The plants that were started in heat early will now be in flower, and they are useful to place in the greenhouse or conservatory when other spring flowering plants have been removed from it. The younger plants intended to flower in the summer or autumn must be potted on into larger pots as they require it. They require a rich compost of good turfy loam, rotten stable manure, and a small portion of crushed bones. Although a rich compost is desirable, I have seen the plants injured by being over-done with rich stimulating manure, so much so that both flowers and leaves dropped off. A light shade is necessary to plants either in flower or those approaching the flowering period. If pyramid-formed specimens are required, a centre stem must be tied to a stout stick, and all side growths must be pinched back.

### PELARGONIUMS, LARGE-FLOWERED.

Where the plants have been well managed they have now formed dwarf compact bushes, the stems being clothed to the base with healthy green foliage. Still tie out the growths, and place sticks to hold any that are out of their places in the position required. It is best to thoroughly fumigate the plants before the first flowers open, and if this is done thoroughly greenfly will not appear on them until the flowering period is over. Now is a good time to put in a few cuttings. These will form good-sized plants by the end of the season and make excellent flowering specimens for next year. The cuttings dislike being placed in hot-beds or forcing-houses. The best plan is to put each cutting separately in a small pot, placing them afterwards on a shelf in the greenhouse; very few of them will fail to form roots in this position.

### ZONAL PELARGONIUMS.

Plants that were raised from cuttings put in early last autumn are now well established in 6-inch pots. These grown on in a light airy house will begin to produce flowers by the end of the month. As soon as it is seen that the plants are well furnished with flower trusses manure-water may be applied in a weak state, but there is certainly more danger of over-dosing these plants than there is of underdoing it. Old specimens will not be so likely to be injured either with richer soil or with manure-water. The variety, too, must be considered; some require very much more liberal treatment than others. A strong-growing variety must be checked by being potted in poor soil, dwarf free-flowering examples being treated exactly the reverse. *J. Douglas, Ilford.*

## Garden Operations.

### KITCHEN GARDEN.

**TOMATOS.**—Within my remembrance the growth of these wholesome and estimable edible fruits was solely restricted to plants which were put out-of-doors in the spring on such places as walls and other sheltered and warm spots, and the demand for them at that time comprised the supply which was required for making sauce and for bottling purposes. Since, however, their use in a fresh state in various ways has been more commonly practised, a taste for them has been extensively acquired and diffused, so much so that they have already increased in popularity and general estimation to such an extent as to create a demand for them at all seasons during the year. This, as a natural consequence has given an impulse to the cultivation of the plant to an extent formerly unknown, and at the present time whole glass structures are to be met with entirely devoted to their culture either for private or commercial purposes.

The improvement in the varieties of the Tomato which has been made during the past few years may in a great measure be ascribed to the increased favour in which they are held. Formerly the large red variety, notwithstanding its defects in the way of furrowed sides, &c., stood pre-eminent for ordinary purposes, and was grown more extensively than any other kind; but since selections for the perpetuation of sorts have had more attention and care, the Stam-

fordian and others of a kindred character have been obtained which possess colour and excellence of quality combined with an evenness of surface and beauty of form which gives them the precedence for most requirements. Recently so many good varieties have been raised or obtained by selection, and now appear in the trade lists, that to make a choice is a difficult matter to those unacquainted with them. I will, therefore, mention a few which, in my opinion, possess sterling merits in their respective classes. The bright red or scarlet section will undoubtedly at all times command most notice in a commercial point of view, and they are doubtless the best for ordinary requirements. Of these the Stamfordian and selected Trophy may be classed as A 1 varieties for exhibition and first-rate for other purposes; while for sauce the old Large Red grown out-of-doors need not be discarded. As fancy kinds, Carter's Green Gage stands first amongst the yellow section, and backs Criterion in the dull reds; others, as the Red Cherry, Red Currant, and Yellow Cherry may also with propriety be included under this head as being interesting in their way.

As the season and demand for Tomatos in a fresh condition is now extended over the greater part of the whole year, the cultivation of this subject has necessarily undergone a change. Instead of its being carried out under natural circumstances alone, as formerly, and the rest of the supply left to the hands of the Continental growers, home growers have at length turned their attention to this subject, and already the process of forcing and growing them in glass structures is established at numerous places, and from reliable authority I gather that good English grown Tomatos meet with a more ready sale in the markets than foreign ones, and at very remunerative prices. We may, therefore, under such circumstances, naturally expect that the production of them in greater quantities will be assiduously pursued for public use, as well as for private consumption. For several years past Tomatos in a ripe and raw condition are often required at various seasons for the breakfast table as well as for the salad occasionally. Such requirements were, in the first instance, the cause that induced me to commence the cultivation of them under glass, and since that time several years have elapsed; but we have persistently carried it on in some degree either by means of pot cultivation or otherwise. The former process can be made instrumental in aiding the supply, where planting out cannot be effected, by means of pots being placed at the ends—where light abounds—of vineries, Pine-stoves, or similar places, but where a house or a portion of it can be spared to these plants entirely they should be planted out, because they are not so likely to suffer from neglect or inattention in watering. Although the Tomato plant may justly be considered an accommodating subject, and readily acclimated to any temperate condition whatever, still to do it properly considerable heat, and as far as possible every ray of sunshine, is necessary, as well as a place where during the daytime a free circulation of dry warm air is proceeding. The compost we find best suited for it consists of about half rough turfy loam, a fourth of roadside scrapings, and a fourth of decomposed manure or horse droppings, moderately fresh. For planting out a ridge of soil, 2 feet wide and 15 inches deep, should be placed on a warm bed of tan or leaves; and for pot cultivation those of 12 to 15 inches in diameter are most appropriate. These should not be quite filled, in order that surface-dressing of the same material or of pure manure may be applied afterwards. We make a sowing for early work in January, and move the plants onwards until they have moderately filled 5-inch pots with roots, when they are transferred to the beds or pots, the plants in either case being kept about 2 feet apart. We likewise sow at other periods, to obtain plants for taking the place of exhausted crops, which occur in the interim between the former and the latter sowing, which is usually made about August 20. From these plants we get a supply for a considerable period onwards through the winter months. We still adhere to the plan on which we at first commenced, of having only one main stem, which is allowed a good run of 6 feet or more as the place may admit, and from which all laterals are removed at an early stage. Other cardinal points in management comprise top-dressings with rich materials, when the surface soil becomes full of roots, waterings copiously given with some stimulating agent intermixed, and keeping the fruit perfectly free from damp while the ripening process is proceeding. For this purpose, in close confined pits, a chink of air should be left on the house continuously.

In the cultivation of these plants out-of-doors they are generally placed in an excellent position to do well, but the main point—the preparation of the places for them—is overlooked or not attended to sufficiently. As I said before, good soil moderately enriched is indispensable to insure success, and soil of this nature does not abound about the roots or in close proximity to wall trees, but by taking out a bushel of soil where it can be done, and adding a like quantity of such as has already been

recommended, the labour involved will be more than compensated for in the end in the yield of fruit of greater size and heavier quality. A heavy mulching of manure should be as soon as practicable after they are planted, be placed about the surface of the plants, to prevent the soil becoming dry and parched. In the case of out-of-door plants we depart from the plan of having individual stems, and let three or more of these main shoots run, because in many places the space will not allow a good run, and a certain amount of growth with foliage is essential to their well-being.

ORDINARY WORK will at this period include, if not already done, the planting of the main crops of both Scarlet Runner and Dwarf French Beans. If the bines of the former subject are to have a good run of 6 or 7 feet in height, the rows should be not less than 6 feet apart; but for those which are not to be supported by sticks 3 feet will suffice; this also will be a suitable distance for French Beans, excepting in the case of very dwarf kinds, when it may be considerably diminished. Former sowings of these will doubtless need attention as soon as they are up, to prevent damage from frost; a few leafy sticks placed inside the rows will answer this end. The preparation for Celery will also soon need attention; the quarters where late winter stuff grew will be available for this crop. Let, therefore, the trenches be dug out and be prepared in readiness to receive the plants immediately they are hit. A good breadth of the tall section of Peas should be sown, and supplementary crops of Lettuce, Spinach, Turnip Radishes, &c., should have due attention, both in regard to sowing and watering. If the places, as before advised, were prepared for Vegetable Marrow, ridge Cucumber, and Tomato plants, these should be planted out into their respective places at the earliest moment it can be done with safety. A finer seed-time could not possibly be desired, nor one for making good defective operations of last year in the way of clearing the land could not really exist. *G. T. Miles, Wycombe Abbey.*

#### FRUIT HOUSES.

VINES.—We are now in the midst of the busiest season, not only in this, but in every other department under glass, and great activity will be necessary to prevent many very important operations from falling into arrear. The past month having been dry, with more than the usual amount of bright weather, Vines in all stages have grown rapidly, and under the influence of solar heat the occupants of late houses which broke weakly have already regained their usual vigour; but we hear complaints of a tendency to the production of tendrils, or loose bunches—a sure sign of imperfectly ripened wood. In our Lady Downe's house, although we applied fire-heat last autumn until the Grapes began to lose colour, the shows are not so numerous as usual; but the bunches are compact, and as large as we wish to have winter Grapes; moreover, we have the satisfaction of seeing the old Grapes fresh in the stalk and berry, with every prospect of their keeping well into June. To prevent the disposition to run into tendril growths the late houses should be started earlier, and receive more fire-heat in the autumn. To correct it, the shoots should be tied down to the wires, and stopped to within three or four eyes of the fruit, the best time for the performance of the work being the latter part of a fine day, when the growths are limp. In mid-season and autumn houses, Muscats and other shy kinds have set as fully as Hamburgs, and will require careful thinning as soon as the properly fertilised berries begin to take the lead. If a large percentage of the surplus bunches were not cut off before they came into flower, no time must be lost in getting them removed; and laterals which have been allowed to ramble may be stopped, tied, and regulated in accordance with the uncovered space at command. Early Grapes now ripening will require moderate fire-heat for keeping up a circulation of dry warm air by day, and a temperature of about 60° by night. Guard against excessive dryness, as early Grapes, with ventilation, take a great deal more water than late ones, independently of the fact that it is better to keep the foliage clean and healthy as long as possible, than to run the risk of having another crop of new Grapes next January. Gradually remove the remains of fermenting material from outside borders, leaving a good mulching of the most suitable for the protection of the surface roots, and allow them to have the benefit of exposure to summer rains, which will wash in the fertilising elements of the manure, and stimulate the Vines into the production of new laterals after they are relieved of the crop. Look well to pot Vines, and if late spring planting is contemplated, no time should be lost in getting it done. Large growing plants from pots or turf may be transferred to inside borders at any time; but the earlier the better, as Grapes cannot be obtained from badly ripened wood, neither will half-ripened canes, when cut down, throw such clean short-jointed growths next season as others that have been properly matured and rested through the autumn. *W. Coleman.*

#### ORCHARD-HOUSE.

Very full instructions as to culture were given at p. 527, and the same treatment may still be continued. Thinning the fruit is very important, and as soon as it is seen that there is no danger of its dropping off it should be finally thinned out. See that all insect pests are destroyed, and that thoroughly. If any of the aphid tribe are seen alive on the leaves a day or two after fumigating, give them another good smoking. Syringe now every morning at 6 P.M., and in the afternoon, just before shutting up; the time for this will depend much upon the position of the house, but a good time is between four and five o'clock. Before shutting up see that all trees that require it are thoroughly watered. We have finally thinned out the Strawberry plants on the shelves to rather less than half the quantity that was placed there in the autumn, or rather winter, because we leave them out until very late in the year. All that are removed we use in the forcing houses, commencing to gather early in March from Black Prince, following on with Keens' Seedling and President. Many other sorts have been tried, but we have gone back to Keens' Seedling as the best for forcing, to come in from April 1 and onwards. The fruit is not only of such a rich dark colour, but of a distinct and good flavour. We have thinned out the fruit, leaving from six to twelve on each plant. We support the fruit with sticks or branchlets instead of allowing it to hang over the sides of the pots. As the plants are now growing freely they require very considerable supplies of water at the roots, and manure-water in a weak state frequently. I believe cow manure soaked in water is the best, and it should be used in a clear state. I do not like guano, it causes over-luxuriance, and does not improve the quality of the fruit. Saucers under the pots are a means of saving watering, but this is also gained at the expense of quality. *J. Douglas.*

#### ORANGE-HOUSE.

The fruit that was set early in the year will now be swelling rapidly, and the only way to obtain good flavour combined with size is to keep up a high temperature, combined with a moist atmosphere, with a corresponding supply of water to the roots. If it is thought that the trees require stimulating, the best plan is to apply surface dressings: the best for this purpose is powdered bones mixed in a liberal manner with good yellow loam—pounded charcoal should be added to it; a handful or two of this spread thinly over the surface of the soil in the pots very speedily causes a change in the growth of the trees. With the increasing temperature, scale and even mealy-bug will appear, but this must be destroyed at once. Ventilate the house as freely as possible. *J. Douglas, Lexford.*

#### PLANT HOUSES.

ORCHIDS.—The grower of these plants will now and for the next three or four months find himself extremely busy in every department. Putting aside the always very necessary work of cleaning plants, pots, floors, and stages, a vast deal of time must be taken up in watering, ventilating, and shading. Beginners in the culture of Orchids always find the watering of their plants quite a puzzling performance. They do not begrudge either water, time, or trouble, but after they have given freely of all three they are in their own minds far from certain as to whether they have injured the plants or otherwise. This, although not pleasant, is a very proper feeling, which time and experience gradually wears away. To such persons two excellent rules can be given: through the winter months keep on the dry side, through the summer keep on the wet. Thus at the present time I would advise every one when looking over their plants to water not only the dry ones but also those of which they are not quite certain as to their being exactly wet or dry. In watering give every plant a thorough soaking. Plants in baskets or on blocks may be dipped up to the base of the young breaks; those in pots should receive sufficient for the water to rush rather than dribble through the lower holes of the pot. The great question then arises, How often is this to be done? The answer depends in a great measure upon how the plants are potted, &c. Taking the cool-house plants, if these are potted in well-drained peat and sphagnum, and the house properly ventilated and shaded, the majority of them will now take a thorough soaking every four or five days. Water less often plants in large pots that have a large mass of material to root in, and a trifle oftener those in small pots that are well-rooted. Imported Odontoglossums and Masdevallias should be watered just often enough to keep the material they may be potted in moist. The moment they break and make roots give more water. None of these plants require syringing overhead, but the atmosphere must be kept decidedly moist. If the Disas are grown in this house they should now be watered both morning and evening. Give them, if well rooted, weak manure-water three times a week, and keep them well to the light in the coolest portion of

the house. Suspended from the roof of this house and growing in baskets or on blocks will be *Cattleya marginata*, *Laelia Dayana*, *Odontoglossum Rossii*, *O. Cervantesii*, *Masdevallia Chimera*, *Wallisii*, *M. bella*, &c., *Sophranites* of several kinds, *Nanodes Medusa*, and *Pleione humilis*. The two last-named, along with *Oncidium nubiligenum* and *O. Phalaenopsis*, should be kept constantly wet in an airy position. The whole of the others should be kept moist, the basket plants having water every four or five days, and those growing on bare blocks every day. For some of the dwarf growing *Odontoglossums* and also for *Dendrobium Jamesianum*, we have used with good results lichen-covered blocks. These, if used immediately after being cut from such trees as Elm and Maple, retain their bark and green covering for three or four years. Plants growing on such blocks run their roots freely among the lichen, and do not require water more often than basket plants.

In the *Cattleya* and intermediate houses there are now no plants requiring a resting and dry treatment. The majority of our *Cattleyas* take a good watering about every five days; some in very large pots and pans go longer, while others in a very pot-bound state are watered more often. Such plants as *Zygopetalum maxillare*, *Vanda cœrulea*, *Cypripedium Boxalli*, *C. Schlimii*, *C. insignis*, *Calanthes* of the evergreen section, *Bolleas* and *Pescatoreas*, and many others, must have water often enough to keep them wet; *Pleione lagenaria*, *P. maculata*, *P. Wallichii* and *P. Reichenbachiana*, that are growing in shallow suspended pans, will now take water every morning, and will appreciate a soaking of weak liquid manure once a week. *Sobralia macrantha*, if showing flower, should also have liquid manure once a week, and be kept at all times wet. The Mexican house will now, if freely ventilated, and not over-shaded, get very hot and dry during the daytime. It must be often damped down, and the plants should now be watered in the evening instead of morning, so that during the cool hours of night they may take up sufficient moisture to carry them through the heat of next day. Avoid getting water into the now pushing growths of *Odontoglossum Londeshoroughianum* and *Oncidium cheiroporum*, or they will certainly rot. In the East Indian-house the whole of the *Cypripediums*, if properly potted, should get a thorough soaking every three or four days. These plants can at no time stand the least dryness. Still water with care *Calanthes* of the vestita section, for until they are thoroughly well rooted they are easily upset by over-wetness. Such plants as *Phalaenopsis*, *Aerides*, and *Saccolabium*, that are rooted in nothing but crock, charcoal and sphagnum, are seldom over-watered at this season of the year. *J. C. Spyers, Burford Lodge, Dorking.*

#### TOWN GARDENING.

SHRUBBERIES AND ORNAMENTAL GROUNDS.—The flowering trees and shrubs here are better furnished with bloom this season than I have ever seen them. I mentioned in one of my former notes that the winter had made sad havoc with the shrubs here; I am sorry further to state that the *Yuccas* are killed to the ground. They may break from the bottom, but their appearance will necessitate their removal from the ornamental grounds to the reserve garden, at least for the present season.

BEDDING-OUT.—This month and June are the great furnishing months of the year. It will not be safe to begin with the bulk of the plants until after the 15th—with *Calceolarias*, *Petunias*, *Verbenas*, then *Pelargoniums*, continuing on with other plants in rotation according to their hardiness. The planting can hardly be performed with too much care. Not only should each plant be placed in the best position for effect, but it ought to be allowed sufficient space to grow, and should be transplanted to it with the greatest possible care, so as not to receive the slightest check. As soon as planted they should be well watered, to prevent them flagging and to consolidate the soil round the roots, so as to enable them to start into fresh growth at once. The great secret of continuous blooming is rich soil, a fair start, with good plants, careful planting, and picking off the seed-pods as soon as they appear.

ORNAMENTAL FOLIAGE PLANTS.—These are, generally speaking, better adapted for growing in town than flowering plants, for the reason that they are more easily kept clean. At the present time *Caladiums* and *Coleus* are conspicuous plants. Of *Caladiums* I may mention *C. argyrites*, *bicolor*, *Chantinii*, and *Wightii*; these are easy of cultivation, and are very pretty table plants. Of *Coleus*, *aurea marginata*, *Beauty of Wildmore*, *Duchess of Edinburgh*, *Emperor Napoleon*, and *Queen Victoria*, with some of the ragged section of more recent introduction, such as *Kentish Fire*, *multicolor*, &c. I think one of the prettiest fire-place decorations I have seen is a bank of these different coloured *Coleus* with an edging of *Lobelia Lustrous* and *Pelargonium Lady Plymouth*, plant and plant, backed up with green foliage plants, *Ficus elasticus*, *Acacia lophantha*, &c. *Wm. Gibson, Chelsea.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	May 10	Sale of Imported and Established Orchids, at Stevens' Rooms. Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 1 P.M.
TUESDAY,	May 11	Sale of the Collection of Orchids belonging to W. A. Gore Langton, Esq., M.P., at Stevens' Rooms. Sale of several Importations of Orchids, at Stevens' Rooms.
WEDNESDAY,	May 12	Sale of a Freehold Estate and Mansion, at Woodstock, by Debenham & Tewson, at Clarendon Hotel, Oxford.
THURSDAY,	May 13	Sale of Importations of Rare Orchids, at Stevens' Rooms. Manchester Botanical and Horticultural Society's Great Whitsunide Exhibition opens.
FRIDAY,	May 14	Sale of Scientific Instruments, at Stevens' Rooms.

A VERY interesting lecture was lately delivered before the Society of Arts by Mr. C. PFOUNDES. His subject, "Art in Japan," appeals to a very large and varied community, and in his way of treating it he shows clearly that to understand the subject it is necessary to enter into the feelings of the people, to know their habits and thoughts, and to be conversant with their history. The designs, which outsiders are apt to look on as quaint and curious only, have, as Mr. PFOUNDES shows, a meaning, which the educated, or in some cases even the uneducated, Japanese appreciate at a glance. We subjoin a few illustrations relating to plants, which may be of interest to our readers and to the large numbers who now make use of Japanese trays and other objects:—

"The following combinations are most frequently met with in Japanese design:—

"*Phoenix and Paulownia imperialis*.—This design is to be seen embroidered on the imperial robes, and on them only, but is frequently depicted on fans, screens, and hanging scrolls ('kakemono').

"*Pine-tree and Stork*.—Both emblems of longevity, a common design, and most frequently used in the embroidery of robes presented to new-born babes, and on other articles, lacquer ware, &c., for festive occasions.

"*Peony and Chinese Lion*.—The Peony is a design usually sketched on large articles, such as screens at the entrance of temples ('tsui-tate'), or on panels, ceilings, &c.

"*Bamboo and Sparrow*, both being of a mild and gentle nature, a design to be seen in embroidery, fans, screens, and household furniture.

"*Equisetum (Scouring Rush) and Rabbit*.—It is supposed that there is an 'usagi' (hare or rabbit) in the moon which scours it with the dried 'Tokusa': a design found on a variety of articles.

"*Willow and Martin (or Swallow)*.—The Willow waves in the breeze, the swallow flits to and fro: a favourite design for fans.

"*Stag and Maple*.—Maple leaves turn red in autumn, and the stag in autumn calls the doe. There is a play in the idea of the colour ('iro') of the leaf changing, and the love ('iro') of the deer; generally sketched in screens, &c.

"*Lepus and Sleeping Wild Boar*.—The wild boar generally makes its bed in clusters of 'hagi.'

"*Cherry and Pheasant*.—The Prunus pseudo-cerasus, cultivated solely for its bloom, is associated with the gorgeously plumed pheasant, generally used in embroidery and coloured designs.

"*Plum and Nightingale*.—The Plum tree, called 'the poets' favourite tree,' in allusion to the verse composed in honour of Naniwa no Oji (afterwards Nin toku Ten O) by Oni (or Wani). The nightingale is fond of song or verse; or one of the most frequent designs.

"*Moon and Cuckoo*.—In allusion to Yorimasa and his verse when he slew Nuyé: the design is usually a bird flying across the crescent moon.

"*Rushes and Geese*.—Geese flying long journeys carry Rushes in their beaks, and, before resting on the water, drop the Rush, and then alight upon it; an allusion to the care to be taken in choosing a resting-place.

"*Chrysanthemum and Fox*.—Hanzoku Tai-shi, prince royal, was bewitched by the nine-tailed fox, in the form of a lovely damsel. He made her his mistress. One day she fell asleep in a bed of Chrysanthemums, resuming the normal shape of a fox. He shot at it with a

bow, and hit it in the forehead. Noticing his mistress afterwards to have a wound on her temple, this led to the discovery of her being a fox.

"*Bamboo and Tiger*.—Tigers feared the elephants, and, therefore, hid in the Bamboo jungle. This design is often seen on screens.

"*Peach-trees and Oxen*.—There is an old Chinese saying, 'Turn the horse loose on the flower-covered mountain, and the ox into the Peach orchard.'

"*A Dragon Crossing the Summit of Fusi-yama on the Clouds*.—Small snakes become dragons, and an abject mortal often becomes an exalted person, rising to a great height, and easily surmounting the greatest obstacles: an emblem of success in life.

"*Long-armed Ape and the Moon*.—It sees the reflection of the moon in the water, and endeavours in vain to grasp it.

"*The Mulberry and the Goat*.—Goats are fond of this plant, and its product paper.

"No mistakes are permitted as to seasons and the appropriate objects. Conventionalised ideas appear in the accepted form in many common designs and groupings, but the artists of Old Japan are above being led by any canon that does not permit of an appeal to Nature's hand-book of art, with the glory and charms of which they are ever surrounded. Theoretical to a fault, and systematic even in their love of variety, colour, and form, the Japanese artists, nevertheless, are no mere servile copyists of Nature, like their neighbours the Chinese. They clothe Nature with the full wealth of their ideal conceptions, and so confer upon it their own mental individuality.

"... A combined triplet emblem of Bamboo, Pine, or Plum-tree is held to be especially suitable for festivals or auspicious occasions, such as marriage. A little bird perched on a blooming Plum-tree is an allusion to a well-known poem.

"Floral forms have a high importance, and widely affect the minor details of decorative art. The arrangement of flowers is also reduced to a system, taught in progressive lessons; the natural forms of the various plants are altered, but with an art that conceals the effort. Daily accustomed to these floral arrangements, backed with hanging scrolls of a Chinese poem or with an artist's sketch, in the hallowed nook that exists in every Japanese sitting-room, the mind grows accustomed to these objects. Every house has a little bit of garden; if without room for more a box is found, containing a miniature garden in the area of a few superficial inches.

"It is thus seen that there was, and is, as a deep current, a strong love of Nature flowing through this people's art instinct. Periodical holidays furnish but an excuse to dress up and have a day's outing; even a visit to a shrine or a temple is ever attractive. Going to church is no mere dull prosaic routine of duty. The flowers of the season, from spring to autumn, furnish periodical excuse for these festive picnics. Pilgrimages to distant shrines give opportunities to visit beautiful or grand scenery, and celebrated places.

"Delighting to look at scenery from a high point, the popular pictorial art may have been influenced by this peculiarity. Thus we see that their love of Nature, of flowers, and poetry, was so intermingled with their domestic life and their art, their literature and poetry, that it is difficult to draw the line where art begins and ends."

We may add that Mr. PFOUNDES has favoured us with an inspection of several objects brought by him from Japan, and amongst others a whole series of drawing-books adapted for botanical purposes. These show a knowledge of botanical detail, relative size, proportion, position of parts, and even of perspective, which would surprise those accustomed to consider the Japanese as our inferiors in such matters.

— DR. NILS JOHANN ANDERSSON.—This celebrated Swedish botanist and traveller, as we learn from the *Botanisches Centralblatt*, died after long suffering on March 27 at Stockholm. ANDERSSON was born on February 20, 1821, studied at Upsal, graduated as Doctor of Philosophy in 1845, and resided at the University as Assistant Professor of Botany. Afterwards he took part in the expedition of the frigate *Eugénie* round the world, 1851—1853, the result of which he published in several treatises which were translated into various foreign languages. In 1855 he became Demonstrator of Botany at Lund, and in the following year was appointed permanent Professor of Botany, Director of the Bergianska'schen Garten and Superintendent of the botanical division of the Royal Museum. There he worked with great success till the beginning of 1879. From here ANDERSSON undertook numerous journeys in the cause of science to Lapland, Norway, Germany, France, England, &c. He also acquired scientific renown through his various treatises, books of travel,

and text-books. Our last meeting with this amiable and accomplished botanist took place at the Exhibition in Cologne.

— EUCALYPTS.—The fifth decade of Baron VON MUELLER'S valuable illustrated treatise on the Eucalypts of Australia is before us. The species figured are *E. amygdalina*, *corymbosa*, *crebra*, *diversicolor*, *hemiphloia*, *incrassata*, *largiflorens*, *paniculata*, *ptychocarpa*, and *trachyphloia*. The text comprises structural and other details relating to these important trees, from which we may borrow on another occasion. In the meantime we are glad to note that the value and interest of this important publication increase as it proceeds.

— THE VINE LOUSE AT THE CAPE.—Mr. CLOETE in a letter in the *Cape Argus* maintains, not only that the pest exists now in certain vineyards at the Cape, but also that it is a native of the Cape.

— THE VINE LOUSE IN ITALY.—For Italy this question is very important, says one of our correspondents, as it involves a constant menace to the now flourishing trade in cut flowers, fruit, and vegetables. Now that we have the Phylloxera in Italy (happily only to a small extent), there is more ground for apprehension than ever. It has been seriously proposed to prevent the holding of our great exhibition in Florence, which, if not interfered with, promises to be as great a success as that of 1874.

— NEW CRIMSON EAST LOTHIAN STOCK.—Mr. DOWNIE sends us cut flowers of this new Stock, which is really fine. The colour is exceedingly rich and deep—an intense crimson-magenta, and the blossoms are very fragrant, forming a dense spike of unusual attractiveness. It will be a valuable acquisition from the richness of its colour. With it came flowers of giant Mimulus, the flowers bold and variously spotted—a very fine strain.

— ANTHURIUM ANDREANUM.—We understand that the 200 plants brought home by Mr. F. C. LEHMANN, and sold at Stevens' Rooms on Wednesday last, realised about £500, individual examples being knocked down at prices ranging from two to seven guineas.

— THE PINES: PINUS.—Dr. ENGELMANN, of St. Louis, has recently published in the *Transactions of the St. Louis Academy of Science* a valuable revision of the genus Pinus, the substance of which we may transfer to our columns hereafter. In the meantime we may state that the primary divisions are founded on the form of the cone-scales, the form of the connective of the anther, the position of the resin canals of the leaf—near the skin of the leaf, in the cellular tissue of the leaf, or close to the bundle sheath, the presence of strengthening or hypoderm cells, the proportion of the wing of the seed, the sub-terminal or lateral position of the cones, the number of leaves, &c.

— EFFECTS OF THE LATE WINTER ON PLANTS.—A sub-committee has been appointed to collect information on this point. Circulars have been prepared for this purpose, and those willing to assist in filling them in will oblige by forwarding their address to the Secretary of the Scientific Committee of the Royal Horticultural Society, South Kensington, London.

— HARRISON'S MUSK AS A BEDDING PLANT.—Mr. DOWNIE recorded the fact last season of this very fine Musk being successfully used as a bedding plant in the North of Scotland, and it may interest some of our readers to know that it was also tried in the neighbourhood of Manchester, at Summerhill, Pendleton, the residence of WM. AGNEW, Esq., M.P., whose gardener, Mr. ELLIS, was well pleased with the result.

— GLADIOLUS COLVILLEI ALBA.—The white variety of Gladiolus Colvillei, known under the popular name of The Bride, is well grown by Mr. SWAN, at Oakley, Fallowfield, for producing choice white flowers for cutting in June and July. The plant is perfectly hardy, but comes much finer when grown in pots and afforded the shelter of a cold frame. Mr. SWAN plants from 8 to 10 corms in 6-inch pots, which give him a dozen spikes or more, that prove invaluable for cutting.

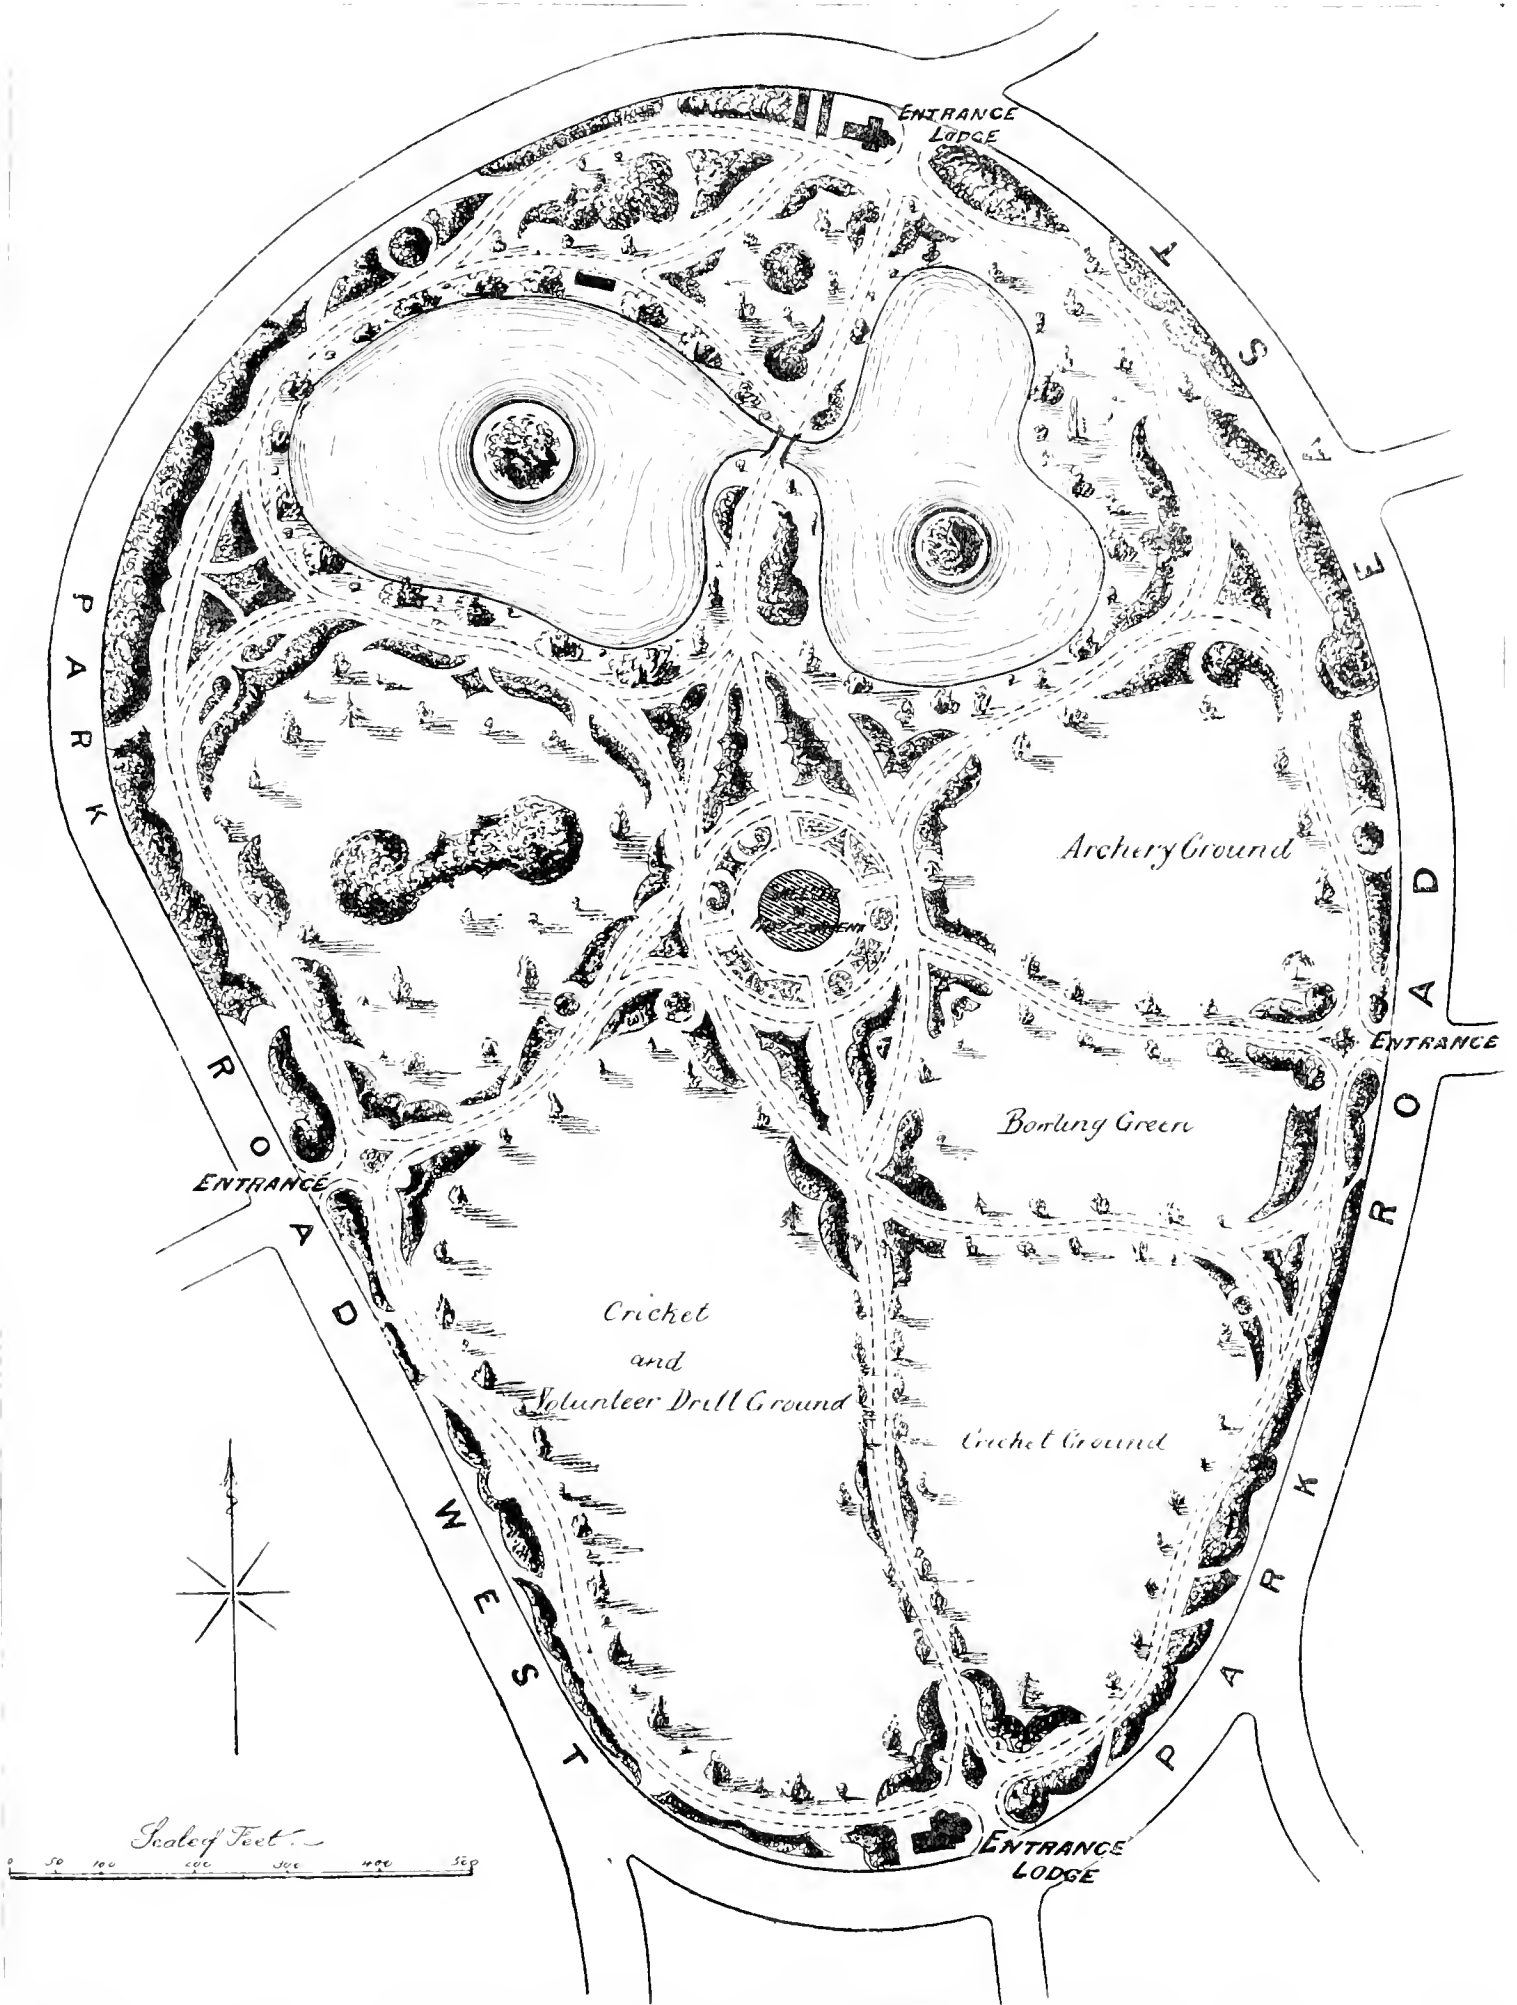

FIG. 103.—PLAN OF THE NEW PARK AT WOLVERHAMPTON. (SEE P. 586.)

— *YUCCA FILAMENTOSA VARIEGATA*.—No where in the British Isles, so far as we know, is this handsome plant grown to so great an extent, or with so much success, as in the neighbourhood of Manchester, where it would almost appear as if the gardeners had a special affection for it. Our latest acquaintance with a fine lot of plants was made a few days ago at The Firs, Fallowfield, where Sir JOSEPH WHITWORTH'S gardener, Mr. SMITH, has a large three-light frame full of plants of various sizes. The method of propagation adopted by Mr. SMITH is that of cutting up the roots in the same way as *Dracenas* are treated, and in a compost of peat, sand, and loam, in which the two former preponderate, the young plants appear to thrive like evil weeds in good ground. It is a native of the Southern States of North America, and will not make much growth in a cool greenhouse, but in a little warmer temperature it grows with great luxuriance.

— *GONIOPHLEBIUM LACHNOPSIS*.—This fine deciduous species from Northern India is strongly recommended by Mr. SWAN as a stove basket Fern for summer decorations. It dies down in winter, but makes up for the winter's rest in a fine summer crop of bold handsome fronds.

— *HIBISCUS ROSEA-SINENSIS* AS A SCREEN PLANT.—Mr. SWAN has employed one of the single forms of *Hibiscus rosea-sinensis rosea* with very good effect as a side screen round the central stage in the little show house at Oakley, Fallowfield. It is planted out underneath the stage, and tied out to the side of the path, where the dark vivid green of its foliage contrasts well with the gay Orchids above.

— STANDARD *WISTARIA SINENSIS*.—One of the leading features in the floral arrangements at the opening of the premises of the general Horticultural Company (JOHN WILLS) Limited, at Warwick House, Regent Street, on Monday last, was some very fine specimens of *Wistaria sinensis* growing in tubs as standards, with large heads 5 to 6 feet in diameter, densely covered with heads of bloom of fine colour. These plants were obtained from Rouen, and it is supposed they are from thirty-five to forty-five years of age at least, and were originally grown up from cuttings. As decorative agents in spacious conservatories at this season of the year they can scarcely be surpassed, and some of our English nurserymen would do well to attempt the culture of plants of this character. So completely did they strike the popular taste that there was quite a competition to become purchasers of them, and large sums were offered by those anxious to possess them. The general public, unaccustomed to this fine Chinese climber, looked on with wonder at "Lilacs" of such unwonted size and beauty of colour. Time is required to get good heads to such plants, but when obtained their beauty is above praise and their value great.

— *CELOSIA PYRAMIDALIS PLUMOSA*.—We learn from Mr. THOMAS SIMPSON, jr. to H. C. WELLS, Esq., Broomfield Lodge, Chelmsford, that he has some small plants in flower of a "lovely strain of *Celosia pyramidalis plumosa*, discovered by a friend near the Kurrum Valley while in search of the scientific frontier."

— THE COLOURS OF FLOWERS, &c.—M. CH. FLAHAULT, in the *Annales des Sciences*, brings forward additional observations to support his view that, under equal conditions, the leaves of plants of the same species are larger in proportion as we go northwards, these relatively large dimensions being due to the duration of light of relatively feeble intensity. In cases where the chlorophyll is formed in the absence of light it must be formed at the expense of the materials stored up in the tissues. The importance of these reservoirs of nutriment is still greater in the case of flowers. Thus, in the case of Hyacinths, both blue and red, M. FLAHAULT found no difference in the colour of the flowers grown in the light or in the dark, the colour being manufactured from the stores of material in the bulbs.

— *TROPÆOLIUM COOPERI*.—A correspondent sends us a flower of this species perfectly "regular" as to form, that is to say, destitute of spur; the sepals, petals, and stamens all of normal number, but the pistil entirely absent, its place being occupied by a shoot some 1½ inch long, bearing two or three small but perfect leaves.

— *ONCIDIUM CONCOLOR*.—A correspondent sends us a flower of this species with the lip divided into two distinct portions. It might be thought that there were two lips, but as the other parts of the flower are normal it is more probable that this is a case of one divided lip rather than of two. The lateral sepals are always partially united, or, rather, are not entirely separated.

— ROYAL NATIONAL TULIP SOCIETY.—A meeting of the subscribers to and friends of this Society will be held to-day (May 8), at the "Bull's Head Inn," off Market Place, Manchester, at 3 o'clock P.M., for the purpose of transacting business, as below:—To enrol subscribers; to appoint officers for the year; to draw up schedule of prizes for, and to fix the day and the place for the exhibition of 1880; to appoint judges; and to transact all other necessary business. The Hon. Sec. (SAMUEL BARLOW, Esq., Stakehill House, Castleton, near Manchester) invites particular attention to the following rule (3) of the United Florist Societies:—"That as the prize list is based upon the subscriptions of the previous year, and the amount promised at the annual meeting in January, the Society considers subscribers of the previous year to still remain members on the same terms, unless they signify their withdrawal from the Society to the Hon. Sec. on or before the annual meeting, which is held on the last Wednesday in January." The Hon. Sec. would consequently be glad to hear from all who cannot attend the meeting, and who have not sent their contributions. All such members should state the day of exhibition which will best suit their bloom, and their wishes will be fully considered by the meeting.

— *TRILLIUM GRANDIFLORUM*.—No words are needed to speak the praises of this plant. We allude to it now merely for the purpose of calling attention to some varieties which Mr. WARE has submitted to our notice, and in which the petals are more or less virescent. The disc or centre of the petal is occupied by a broad or narrow belt of green, the edges being white. The effect is very pretty.

— *RACEMOSE POLYANTHUS*.—In the ordinary *Polyanthus* the flowers are borne in an umbel or truss at the end of the main flower-stalk. Mr. WILSON sends us one in which the flowers are arranged in a cluster or raceme, each flower-stalk being separated from its neighbour by a long interval. The result is clearly produced by the lengthening of the stem between flower and flower—but why? We know not.

— WINE OF *BERBERIS AQUIFOLIUM*.—According to Dr. ENGLMANN this is called Mountain Grape in Colorado; and the juice, when fermented, makes, on the addition of sugar, a palatable and wholesome wine.

— THE BOTANY OF CAPTAIN WHEELER'S SURVEY of the United States' territory bordering on Mexico and west of the hundredth meridian has recently reached this country. Like most of the works issued by the Engineer Department of the United States Army, it is a handsome volume, well printed on excellent paper. It is also very interesting, as it deals with the vegetation of a region where the northern types are gradually replaced by Mexican types. There are, however, very few novelties described or figured. *Paryella*, which may be an apetalous *Dalea*, and *Palmerella*, Dr. GRAY'S new genus of *Lobeliaceae*, are both figured. Professor J. T. KOTHIROCK is the editor of the work, and he has had the assistance of the principal botanists in America. We have extracted a few interesting notes, which will appear amongst our short paragraphs, or *Variorum*.

— *MEDINILLA MAGNIFICA*.—Mr. H. C. WELLS has now in flower at Broomfield Lodge, Chelmsford, a magnificent specimen in a 10-inch pot of this remarkable plant, with no less than sixty-one of its pleasing pendulous racemes of rosy-pink flowers, fully expanded.

— A BOTANICAL PRIZE.—A Silver Council Medal is offered by the Pharmaceutical Society for the best herbarium collected in any part of the United Kingdom between May 1, 1880, and June 1, 1881; and should there be more than one collection possessing such an amount of merit as to entitle the collector

to reward, a second prize, consisting of a Bronze Medal, and also Certificates of Merit, will be given at the discretion of the Council. In the event of none of the collections possessing sufficient merit to justify the Council in awarding medals or certificates, none will be given. Competitors must be Associates, or apprentices, or students of the Society, and under twenty-one years of age. The collection must consist of phanerogamous plants and Ferns, arranged according to the natural system of DE CANDOLLE, or any other natural method in common use, and be accompanied by lists, arranged according to the same method, with the species numbered.

— *CATTELEYA SKINNERI*.—Mr. PARSONS, gardener to W. J. BLAKE, Esq., Danesbury, Welwyn, has sent us a fine spike of flowers of this showy Orchid, one of nine cut from a plant growing in a 6-inch pot. That there are good and poor varieties of this as of most other Orchids, is proved by the example before us, which is not nearly so bright in colour as Mr. BOSCAWEN'S, nor so large in the size of the flowers, though very beautiful for all that.

— GRAFT HYBRID PEAR.—At p. 53 of our present volume we were enabled to give illustrations of a Pear shown before the Scottish Horticultural Association by Mr. BURNS, of The Gardens, Thingwall Hall, near Birkenhead. It appears that a tree of Aston Town was headed down, and a graft of *Beurré Clairgeau* worked on it. In due time a fruit was produced which in size, form, colour, speckling, and in the nature of the core and pips, was curiously intermediate between the two varieties mentioned. Mr. BURNS has now obligingly furnished us with flowering spurs of the three kinds. Although the intermediate character of the supposed graft hybrid is not quite so readily discernible as was the case in the ripe fruit, yet in hairiness of shoot, in size and form of leaf, in length of flower-stalk, in form of the flower-tube (the future fruit), in length of petal, and other characteristics, the hybrid is intermediate between the two others. The case is a very interesting one, and it is the more valuable from the accuracy with which Mr. BURNS has observed and recorded what fell under his eye. In our former notice we threw out the suggestion that the intermediate character of the fruit might be due to graft-hybridisation, or to the influence of the pollen of flowers of Aston Town (stock) on those of *Beurré Clairgeau* (scion). That such an action of the pollen on the fruit does occur in rare instances there seems now no reason to doubt, but it is clear it would only affect the fruit. Now that we have flowering specimens before us showing similar intermediate characters, the pollen theory therefore falls to the ground. There remain two other theories—one, that it is due to natural variation, a consequence of mixed parentage; the other, that it is really and truly due to graft-hybridisation. In spite of the prevalent scepticism among gardeners as to this point, we incline to the latter view. How else can the intermediate character of the fruit in question be accounted for?

— *ERYTHRONIUM GIGANTEUM*.—In the bog-garden adjoining the rock-garden in the York Nurseries, this giant dog-tooth Violet is now finely in flower; its large blossoms, borne severally on stems 6 to 10 inches high, are very attractive. Not far from a colony of these we noticed another plant bearing a solitary pure white flower. This latter variety, if imported in quantity, would, we feel sure, prove a welcome addition to lovers of this beautiful class of early spring flowers.

— *PRUNUS (CERASUS) PENNSYLVANICA*.—For ornamental plantations this pretty spring-flowering tree—the wild Red Cherry of the Eastern United States—deserves to be more extensively planted. In the Arboretum at Kew a fine specimen is now one mass of umbels of white blossoms. The smooth, green, lanceolate, sharply-serrated leaves, are developed after the flowers have fallen; the colour of the bark is a light reddish-brown. In its native habitats it is a tree of 20 feet to 30 feet in height.

— HARDY HERBACEOUS PLANTS AT KEW.—One of the foremost in beauty as well as in interest amongst all the herbaceous plants now flowering at Kew, is *Oxalis enneaphylla*, of which there is a fine specimen in a cold frame. Its glaucous leaves and large snowy-white blossoms are particularly handsome;

it was introduced from the Falkland Islands four years ago by the officers of the *Challenger*. The prettiest of the Epimediums are the Japanese *E. Muschianum* with large white flowers; *E. Perralderianum* from Algeria, with smaller bright yellow ones; and *E. pinnatum* (and its variety *elegans*) from Persia—the type being less robust, with smaller flowers and with foliage not so striking as in the variety, which, of the two, is certainly the most desirable plant. The deep red form of the common *E. alpinum* is also decidedly worth notice; *Alyssum podolicum* deserves mention on account of its neat habit and very floriferous character; as a dwarf carpet plant for early spring bedding, it seems one of the best of white-flowering plants. *A. montanum* would make a charming companion to the last-named; it is equally dwarf in habit, but its compact, umbellate racemes of rather large flowers are a clear golden-yellow. The earliest of the perennial Geraniums is the European *G. aconitifolium*, a profuse flowerer of a dwarf habit—about 1 foot or 15 inches high. It has pretty palmated lilac and white blossoms. *G. Wlassovianum*, a native of Siberia, rather dwarfer than the last-named, is just beginning to open its charming pink blossoms. Amongst rock plants few are more striking than *Geum pyrenaicum*, a lovely plant with large golden-yellow flowers; it only grows from 4 to 6 inches in height. The fine upright racemes of *Lupinus nutkaensis* are very conspicuous; in colour the flowers are a dark blue, with the exception of the standard, which is a peculiar combination of whitish, blue and pink. The plant only attains the height of about a foot. *Clintonia borealis* is an interesting and pretty North American perennial of dwarf habit, with broad green entire leaves and upright scapes, bearing nodding bell-shaped yellow blossoms.

— *FICUS STIPULATA*.—This hardy little climbing plant, best known in gardens under the name of *Ficus repens*, is made good use of in the Manchester Botanical and Horticultural Society's garden as a basket plant. It will grow almost anywhere, and any one in search of a good hardy evergreen plant for a basket to hang in an unheated house could scarcely do better than adopt it for such a purpose. It thrives well in an ordinary good potting compost.

— THE FALLOWFIELD ORCHIDS.—In Mr. WILLIAM LEACH'S choice collection of Orchids at Oakley, Fallowfield, which is under the charge of Mr. SWAN, we noticed in flower the other day a very nice assortment, which included a lovely variety of *Odontoglossum Pescatorei*, with branching spikes of flowers the sepals and petals of which are beautifully shaded and spotted with rosy-purple; an especially dark and fine form of *Odontoglossum triumphans*, rendered all the more distinct by contrast with some ordinarily good varieties by its side; a good type of *O. Hallii* with a spike 4 feet long; *O. Andersonianum*, with a fine four-branched spike; the pure white variety of *O. Roezii*; *Aerides affine superbum*, with three good spikes; *Masdevallia Veitchii*, a fine type with broad flat flowers in which the purple shade is more intense than in the original form; *O. cirrosus* with three and four grand spikes on a plant; the pretty *O. membranaceum*; the lovely coloured and rare *Epidendrum Frederici Guillelmi*, with a grand spike; *Oncidium leucociliolum*, with a long branched spike; *Phalenopsis Luddemania*, good masses obtained by laying the flower-spikes, which throw out young plants at the tips; *Vanda gigantea*, with a spike of thirteen large flowers. A trained specimen of *Dendrobium Falconeri* about 2 feet through, and the same in height, will shortly be in grand bloom. The collection also contains some notable specimens which are not now in bloom, amongst them being three good pieces of *Zygopetalum rostratum*, a rare Orchid about which Mr. ANDERSON recently made a pertinent question; the rare *Aerides crassifolium*, just coming into flower; a fine plant with two strong leads of the very scarce *Cymbidium Parishii*; and some grand masses of *Cypripedium Parishii*, *C. Stonei*, &c., as well as a number of seedlings which have yet to flower.

— *PYRUS SALICIFOLIA*.—The Willow-like foliage of this species is so densely clothed with long, silvery, silky hairs as at the present time to give the trees the appearance—even at a rather short distance—of being covered with white blossoms. This species forms a wonderful contrast to the *Pyrus sinensis* noted elsewhere. In connection with either, LODDIGES'

remark is certainly worth quoting: "The contrast of colour is a pleasing point, which, as well as form, should never be lost sight of in the formation of ornamental plantation." It was discovered by PALLAS in Siberia, just a century ago. At Kew it forms a small tree with somewhat pendulous branches, and its beautiful silvery leaves make a strange and striking contrast to the tender green of the foliage of many of its allies. Mr. LYNCH sends it us also from Cambridge.

— *SCHIZANTHUS PINNATUS*.—It is not often that one meets with this fine greenhouse annual done well, and yet it is a plant worthy of every attention. Mr. FINDLAY grows it in admirable style in the Botanic Garden at Old Trafford, where a number of specimens will shortly be in full bloom. The seeds are sown here in September, the plants grown through the winter in small pots, and transferred in spring into 6-inch size, in a good rich compost.

— *ONCIDIUM KRAMERIANUM* has large, very glossy yellow flowers, which are heavily blotched with a sort of olive-purple; the lip is handsomely frilled, and is densely spotted with yellowish-brown. We lately saw a specimen of this charming species in flower at Messrs. J. BACKHOUSE & SON'S nurseries, York.

— A PALTRY OBJECTION TO A PRIZE-WINNER.—We (the *Gardeners' Record*) learn that the rumour with regard to the Council of the Royal Horticultural Society of Ireland reversing the decision of the judges in the class for a group of exotic plants was quite correct. "The Council, however, had no option in the matter, the objection lodged being a purely technical one, namely, that one of Mr. SMITH'S plants (*Medinilla magnifica*) was growing in a tub and not in a pot, and as this clearly contravened the rules of the Society's schedule, the Council were compelled to entertain the objection, and finally to reverse the decision of the judges. At the same time we must say the objection was a paltry one, and of such slight moment that we are surprised to find a practical gardener lodging it when he was otherwise fairly beaten."

— *PYRUS SINENSIS*.—In the Kew Arboretum this species is now conspicuous, owing to the warm reddish tints of its large glossy leaves. For foliage effect in spring it certainly deserves to be much more frequently used; it is quite unlike any of the other members of the genus in the large collection at Kew. It was originally introduced from China by the Horticultural Society in 1820, and was figured in *Botanical Register*, vol. xv., t. 1248. The species often met with in gardens under this name is a totally different plant—viz., *P. spectabilis*, also a native of China. It is known by the names Chinese Pear, Snow Pear, and, on account of its hard gritty fruit, Sand Pear. In the *Gardeners' Chronicle* for October 9, 1875, p. 457, a figure of the foliage and warty fruits is given from specimens supplied by Messrs. LEE.

— "FLOWER" SERMON AT SLOUGH.—On Saturday last the Rev. Canon FARRAR preached a "flower" sermon at the Slough parish church, at which about 1000 children, chiefly belonging to the parochial schools, were present. Every child brought a nosegay of flowers, and at the close of the service these were deposited on the steps of the chancel, the offerings being intended for the children who are inmates of the Westminster Hospital. The flowers, which formed a large bank and completely scented the chancel of the church, were afterwards taken to London by Canon FARRAR. The Canon selected his text from Matthew vi., 26, "Consider the Lilies of the field, how they grow."

— MESSRS. WILLIAM PAUL AND SON'S ROSE SHOW.—On Wednesday last this famous firm of rosarians opened a special exhibition of Roses in pots in the Royal Botanic Society's Gardens, Regent's Park. The display, and a very good one it is, will be found in the long corridor, where, on the glazed side, there is a row of small plants occupying the entire length, and on the opposite side, on a low stage, two rows of larger and finer plants, many of which are conspicuous for the grand size and rich colour of their flowers. There are about 500 plants on view, included amongst them being some of the newer varieties, such as Duchess of Bedford, not large but fine in colour; Countess of Rosebery, of the same type as the former, but rose in colour;

Innocente Pirola, a white flesh-tinted Tea Rose, fine for bouquet-work, &c. Magna Charta is represented by flowers which rival in size those of the giant Paul Neron, while a few examples of Elizabeth Vigneron are but little inferior in size. The exhibition will be kept open till Wednesday next, and will be found well worthy a visit.

— *LOMARIA OBTUSATA*.—From specimens which have been communicated by Messrs. R. P. KER & SONS, of Liverpool, we are able to state that the *Lomaria* shown by them at Manchester on the 27th ult., and rewarded by a First-class Certificate, is the New Caledonian *Lomaria obtusata*, an elegant species, growing a foot or more in height, with a tuft of narrow lanceolate sterile fronds, attenuated towards both the base and apex, and with the close-set pinnae or lobes, which diminish below into acute auricles, very strongly falcately curved above, so that the points of the lobes almost or quite overlap those in front of them. The erect fertile fronds are broader than the sterile, but resemble them in being narrowed to the base, through the abortion of the pinnae, and attenuated at the apex, so that the extreme point is caudate. It is a Fern of evergreen habit.

— INSTITUTION OF SURVEYORS.—The next meeting will be held on Monday evening, May 10, when a Paper will be read by Mr. J. POTTS, jun., entitled "Remarks on the Rating of Mines and Quarries." The chair to be taken at 8 o'clock.

— CROPS IN THE SAN LUIS VALLEY, COLORADO.—In his Report on the vegetation and agricultural capabilities of Colorado, Prof. ROTHROCK gives the following particulars, obtained from one of the most reliable men in the valley:—Oats per acre produce 40 to 50 bush., weighing 40 lb. per bush.; Barley, per acre, produces 50 bush., weighing 55 lb. per bush.; "Bald Barley," per acre, produces 50 bush., weighing 75 lb. per bush.; Wheat, per acre, produces 30 bush., weighing 65 to 68 lb. per bush.; Potatoes, per acre, produce 300 bush.—of course an unusual yield. Turnips, Onions, Beet, Radishes, and Cabbages, yield well, and grow to an immense size. The foregoing particulars relate to a very fertile portion of the valley, the average produce being considerably lower.

— THE WEATHER.—General remarks on the weather during the week ending May 3, issued by the Meteorological Office, London:—The weather was generally fine, and for the most part bright, in all parts of the kingdom. On April 28 and May 3, however, the sky was very cloudy or overcast, and rain fell in a few places; a sharp thunderstorm, accompanied by hail, was experienced over our southern counties during the afternoon of the 31. The temperature was below the mean for the time of year in all districts; over Ireland and Scotland the deficit was only 1 to 3°, but in England as much as 5° or 6°. The highest of the maxima (63° at Durham, and 67° at Loughborough) occurred on May 2, and the lowest minima on April 30. Several slight frosts were registered, and at many inland stations the thermometer fell to 28°—at Bawtry to 27°. The rainfall was much less than the mean in all districts, the largest amounts reported being two-tenths in "Ireland, W. and S." Bright sunshine shows some further increase in nearly all parts of the kingdom, the number of hours recorded being about half those during which the sun was above the horizon. The amount of sunshine was moderately equable over the country, but was rather larger in Ireland and the western parts of England than elsewhere. The wind was northerly to north-easterly during the first three days over the whole kingdom, but became westerly in Scotland, and easterly at the southern stations on April 30. During May 1 and 3 it varied greatly in direction over all parts of the country, and finally settled into the north on all our coasts. In force it was generally light or moderate, but blew rather strongly from the north-east on our southern coasts during the first half of the week, and rather stiffly from the southward in the west and north on the 1st and 2d inst.

— GARDENING APPOINTMENTS.—Mr. J. LAINE, late gardener to W. H. WILSON TODD, Esq., Halnaby Hall, has been appointed gardener to NATHANIEL BRIGGS, Esq., Kawdon, Leeds.

## GARDEN GOSSIP.

BY A LADY.—NO. V.

A BOUQUET FROM BORDIGHERA.—Every one has heard of the beauty of the flowers of the Riviera, and in these days, when almost every one travels, many people have seen something of them; but a visit from old friends is generally at least as acceptable as one from new, and therefore I trust I may be pardoned for offering my readers a drawing made from flowers which reached me by post from Bordighera in the last week of March (fig. 104).

The Tulip in the centre (*T. Clusiana*) is white with a broad red stripe on the outside of the three outer perianth leaves, showing through on the inside as a faint pink tinge only; a dark purple spot in the centre sets off the dark stamens. The Narcissus (*N. Tazetta*) is white with a golden cup-shaped corona (does it thence take its name of *Tazetta*, Italian for a "little cup"?). The *Orehis* is one of several varieties found in the Riviera, all of which are, I believe, grouped together by Mr. Moggridge as *Ophrys insectifera*. I fancy it does not materially differ from our *O. aranifera*. The sepals, petals, and column of this specimen are all green, but the tip is of a purplish-brown with lighter stripes, and is very downy. These three flowers, though very common at Bordighera, were new to me; but *Aram arisarum* and *Anemone stellata* (the two lower flowers in the picture) recalled a visit to Nice, made one winter many years ago, and the intense delight with which we hailed the first *Anemones* that appeared in the Olive groves just above the town. Apparently, both the *Anemone* and *Aram* remain long in blossom, since we found them that year in the first week in January, though possibly they flower later at Bordighera than at Nice, the climate of the former being the colder of the two. My friends write of having been "none too warm" in winter clothing at Bordighera, though they had previously been oppressed by the heat of Cannes and Mentone; this, however, may have been partly due to the accident of their visit to Bordighera being ill-timed as to weather; for I am told they have seen but little of the "cloudless skies" of Italy, nearly every day being wet, although the first three weeks of their stay at Bordighera coincided with the bright sunny weather which we were all rejoicing in, in England, before the return of cold weather in April. But the flowers blossomed in spite of cloudy skies, and fresh ones were found after every shower. The first parcel of plants that reached us at home was greeted joyfully on its arrival, but our pleasure was damped when we learnt that two had been sent off, whereas only one arrived. The next morning, the label that had been attached to the second was delivered alone! As that second parcel had contained two *Narcissi* that are not common at Bordighera, one of which (the paper *Narcissus*) was described to us as of surpassing beauty, we were particularly vexed at its non-arrival. I have a strong suspicion that it was confiscated *en route*, and never left Italy. Why plants leaving the country should be interfered with is not very clear, unless the post-office officials have a fancy to keep any rare plants for themselves, but nearly every parcel that arrived gave me the impression of having been opened on the road, and but few flowers reached me fresh enough to draw. One tin box was an exception: it showed no signs of having been disturbed, and the flowers in it were as fresh as if just picked. The custom-house officers are very particular as to what flowers are taken into Italy just now, I believe for fear of the introduction of disease to the Vines and Oranges.

They examined and rapidly named each wild flower in a nosegay which one of the party carried in her hand, but allowed it to pass. They confiscated an Orange, but did not object to Roses and other garden flowers being taken through.

I heard that one gentleman who was bringing in a choice collection of dried flowers had it snatched from him and thrown in the fire before he had time to remonstrate. Every botanist will feel deeply for him. These distinctions seem capricious to the English, but doubtless are not so, though it is very likely that lack of time for careful examination may sometimes precipitate the fate of collections. *A. B.* [It is possible that by an overstrained application of the terms of the Phylloxera Convention the passage of the parcels mentioned were stopped on the frontier between France and Italy. We have just received a box of Roses from Mentone, which reached us in fair condition. *EDS.*]

## Home Correspondence.

Roses.—We now begin to see the real effect the frost has had on the Rose trees, and it is, as I feared in the earlier part of the year, more disastrous than most people imagined. Two-thirds of the dormant buds, *i.e.*, those budded last autumn, are dead, hardly a Tea has survived. Standards have fared nearly as badly, and numbers of the dwarfs we have had to cut quite back to get any buds to start at all. The hot sun and cold winds of last week have told tales even on those Roses we hoped had escaped; branches are continually withering away, and necessitate the

soaking of manure-water will be most beneficial. I hope I am a false prophet, but I do not anticipate a good Rose year. *E. L. F.*

The Hyacinth at Home.—I visited the bulb farms about Haarlem on April 18 and following days, and saw the *Gardeners' Chronicle* there of the 17th, in which, on p. 498, your correspondent speaks favourably, and justly so, of the appearance of Hyacinths being better than last year. I simply write in case many of your readers, like myself, might have been impressed by what is stated, that the general failure in this country in Hyacinths may be attributed to our own fault in growing them, but this is not so; and

FIG. 104.—A BOUQUET FROM BORDIGHERA.

frequent use of the knife. Those trees that have stood the frost are breaking very unevenly, numbers of the young shoots are blind, and on the whole I never remember seeing Roses look worse. I am afraid that however favourable the weather may be, that fine show blooms will be few and far between, at least so far as this part of England is concerned. The Roses that have survived the best are Marquis de Castellane, Madlle. Marie Cointet, La France, Madame V. Verdier, Baroness Rothschild, E. Monten, Dupuy Jamain, Abel Grand, Abel Carrière, &c. The east winds have as usual brought thousands of the Rose maggots: these ought to be carefully sought for, and the leaf pinched between finger and thumb. If this is not done every Rose attacked by these pests will be injured, as they eat into the heart of the young Rose-bud. If the weather continues dry, a good

Mr. Krelage, whom I had much pleasure in meeting in his own gardens, confirmed my own views, that the cold, wet season of last year failed to perfectly ripen the bulbs, and consequently they would not bear the "forcing" that they are subjected to with us, and hence the reasons that their own flowers growing in the open ground are above the average quality. I was also much charmed with the Tulips, as well as Hyacinths, both being in flower at one time, which is an unusual occurrence. I was told by several growers that such a thing had not happened for fifty years. I have never seen so gorgeous a display of colour, and if I say there was acre after acre of their brilliant hues and fragrance under an almost cloudless sky, some idea may be formed of the splendour of the sight. I hope we may have again a warm May and June, and develop the bulbs; if so, with ordinary

cultivation, we may see next year spikes of Hyacinths of such a size and quality as for the last two or three years we have failed to meet with, except in a few instances; but I shall advise, after the experience of the two wet seasons, that a later time be fixed for our spring exhibitions, at any rate for a year or two, for it is impossible, unless bulbs are thoroughly developed by Nature's own means, that a good bloom can be obtained under the hard forcing they are subjected to. I may by-and-by, if you think your readers would appreciate it, revert to the whole matter of Hyacinth culture, founded on my experience at home and in Holland. *James Cutbush, Highgate Nurseries, London, April 29.* [Mr. Cutbush's notes of experience would be highly appreciated. Eds.]

**Fruit Prospects.**—As you are supposed, Messrs. Editors, to be able to answer all kinds of questions satisfactorily, I have to ask what connection have the changes in the political world with open-air fruit prospects? The changes are certainly coincident, and I am fairly puzzled. Surely our fruit trees are not smitten with the Radical fever—I cannot entertain so awful a thought, and hence my appeal, which please not to spurn, seeing that I have exhausted all my own powers in attempts to unravel the mystery before applying to you. The facts of the case are these:—A few weeks ago fruit prospects in these gardens and districts were gloomy in the extreme; within the last fortnight this is certainly reversed, Peaches alone being a failure. Apples are moderately well blossomed, Pears ditto: on walls the trees are exceedingly well furnished with blossom. Plums and Cherries are literally covered with flower, and all small fruits grand. With a too vivid recollection of the abnormally unseasonable of last year one has misgivings concerning the fruit setting, but even this fear is being rendered groundless, as some of the earlier Pears, Plums, and Cherries have already set well. To my mind the entire change (apart from politics, of course) is more than marvellous, and so I have been theorising ament the cause of it, and the only feasible solution at which I can arrive is that the severity of two winters consecutively has checked the flow of sap, and so done by natural means what we try to do by artificial, viz., by root-pruning and repression of growth during the summer season induced fruitfulness. This view of the matter receives confirmation from the fact that we have several trees now covered with blossom that have failed to fruit satisfactorily for years past, and this is rendered the more remarkable owing to the flower-buds being so small that no one a few weeks ago could with any certainty decide they were flower-buds. Whether or no my theory is the correct one I leave you, Messrs. Editors, to decide, feeling sure that, with myself, you will see that the facts are worthy of discussion. *W. W., Heckfield.* [Doubtless the accumulation of nutritive matter during the fruitless seasons favours the production of fruit when climatal circumstances permit any to be formed. Eds.]

**Kidney Beans.**—Your correspondent, "R. D." does not trace the history of the Kidney Bean very far back—only to Carter's Seed List of 1842. I have a seed catalogue in my possession published in 1687, entitled "*A Catalogue of Seeds, Plants, &c.*" sold by Edward Fuller at the "Three Crowns and Naked Boy," at Strand Bridge, near the "Maypole;" Theophilus Stacy, at the "Rose and Crown," without Bishopsgate; and Charles Blackwell, at the "King's Head," near Fetter Lane end in Holborn, London." The Beans offered in this list are—Windsor Beans, Sandwich Beans, white Kidney Beans, speckled Kidney Beans, Canterbury Kidney Beans. The *Gardening-Book* in which this list is advertised says, relative to Kidney Beans:—"Kidney Beans were as ancient a food as the other (*i.e.*, Broad Beans), and in great esteem with the old Italians, yet within the memory of man were a great rarity here in England, although now a known and common delicate food. *Systema Horticulture*, by J. Woolridge, Gent., 1688." The catalogue is very interesting, showing as it does the great advance in some of our common vegetables, and the little alteration in others. *Jno. Gould.*

**Cucumbers.**—These are much appreciated here, and as the demand on our indoor space by the future occupants of the flower garden is considerable, and as we cannot boast of a Cucumbers-house proper, we have to cut and contrive to make the most of our small propagating stove. This is a span-roofed structure with slate and iron benches above the hot-water pipes and a brick pit in the centre. One side is occupied by Dracenas, Eucharis, Ferns, Stephanotis, &c., on the other we place four Cucumber plants, one to each light. We generally sow about the last week in December: this season's plants were sown last Christmas-Eve, but as we could not command a much higher temperature than about 55° at night and 60° by day, without an extravagant use of fuel, they came on rather slowly. With a higher temperature they are now fruiting abundantly, the first being cut on March 26. We give each plant about a hatful of

soil to commence with, adding to it as the roots demand more, and train the shoots to wires near the roof. Each shoot is stopped close to a fruit, not one leaf beyond as usually advised. The compost used is good turfy loam and half decayed leaves, with a 6-inch potful of soot to a barrowload of soil. For later work plenty of frames become available. The variety most approved of here is Cuthbert's Favourite, an excellent variety, possessing a flavour far superior to that of the Telegraph, whilst equally hardy and prolific. *George Duffell, Winchmore Hill, N.*

#### The Past Winter and the Coming Summer.

—The letter of mine which you published on September 29 last contained a warning relative to the then approaching winter. I predicted that we should have "sufficiently severe frost to justify more than usual precautions for the protection of plants, &c.," but, although I foretold a severe winter, I said that it would be "much shorter" than the previous winter was. My forecast has been fulfilled exactly. We had a very severe and destructive frost, but the winter severity was "nothing like so long as it was in the preceding season of 1878-79." Now with regard to the coming summer. It appears certain that we shall have a hot season. I reckon that a period of unusually hot weather will occur in the last fortnight or three weeks of June, and that July will be hotter, I believe considerably hotter, than the average. I reckon that we may look for a high maximum temperature in July as well as in June; in fact I expect glorious summer weather then. *George D. Brunham, Barnsbury, May 1.*

**Claytonia sibirica.**—I recently met with this pretty little plant flowering abundantly in a very smoky garden just outside Blackburn, where it seemed to be the only thing in flower not more or less spoiled. *C. W. D.*

**Clianthus Dampieri.**—This Glory Pea of the Antipodes is a highly ornamental and interesting plant when well managed, and is far less seen growing in our gardens than it deserves. One of the reasons is, that it is a bad wintering plant under glass, and requires to be reproduced from seed. It is also difficult to get it to vegetate, and fastidious to manage when young. I do not know whether it may be owing to the seed being imperfectly ripened or old seed, but year after year we have tried it all sorts of ways with imperfect success. There should not be any difficulty in getting into this country a good yearly supply of fresh seed from its native habitat, where it grows on sandy wastes and crawls along on the surface. In the year 1870 we managed to get up a good stock of it, and having more than was required for pot culture a few were planted out in the open borders, where they flowered even better than those under glass. They will even bear a few degrees of frost with impunity. On referring to the December number of the *Florist and Pomologist* of that year, where a short notice is given which I had sent to the editor regarding it, I see that it was fresh and flowering on November 10, having withstood 3° of frost. This is a strong inducement to more general cultivation, and I hope some of our spirited seedsmen will try through their friends to get home a large consignment of seed, that will be more easily managed. *J. Webster, Gordon Castle Gardens.*

**Sparrows and Primroses.**—I sympathise with Mr. Fish in his trouble caused by the sparrows. They used annually to demolish all my spring flowers, pecking off the hearts of the Primrose plants after pulling off all the buds, and this apparently for wanton mischief, as I never could discover that they swallowed any part of them. I used to console myself with an annual moan in the *Gardeners' Chronicle*, and was generally told in reply that the sparrows obeyed their instincts, given them for some good purpose, and that it was wicked to interfere with them. But with all due respect for those who deprecate an indiscriminate and useless destruction of animal life, I think there are limits beyond which mankind cannot be expected to endure the nuisance caused by vermin, whether feathered or furred; and I maintain, in spite of all the special pleadings of humane naturalists, that to the gardener and farmer sparrows are amongst the worst of vermin. I find by far the best remedy against them is a judicious use of a certain preparation of *max vomica*; but it requires such great caution in its use that I by no means recommend its general adoption, unless those who employ it are willing to keep a responsible person constantly on the watch about the places where it is used. As for the dire consequences with which those who destroy their sparrows have often been threatened I have not yet been troubled by them. *C. Wolley Dod, Llanthobno, May 3.*

—The birds attacked my Primroses this spring, as in former seasons, and began amusing themselves by picking off the small buds of double Primroses and Polyanthus. To prevent this mischief I put some short sticks into the ground at intervals and attach

some fine twine, allowing it to hang rather loosely; it is not at all noticeable or disfiguring, and serves effectually to keep the birds away. I suppose their claws catch in the twine and make them suspect a trap. For a single plant or a small group I place one short stick, round which two bits of twine are tied, so as to make four streamers, and the worms generally fix the ends in the ground. All the plants or lines protected in this way have been left entirely unmolested. Last year the birds took a fancy to *Scilla sibirica* and *Crocuses*, but have not touched them this spring. *G. H. W.*

**The Weather and the Fruit Blossom.**—The wind changed to the east on the 26th ult., and in the course of the afternoon the unsettled state of the sky indicated that a storm was pending. Later on there were several smart showers of hail, which left no doubt that a keen frost was not far off, and the result has been that our worst fears have been fully realised, the glass falling this (Tuesday) morning to 26°, or 6° of frost. Gooseberries and Currants are slightly browned, but the exact amount of damage done cannot be fully reckoned for a day or two. All other kinds of fruit trees that were hurriedly protected seem to have escaped, and one hopes and looks anxiously for the vane to point to some other quarter than the east. *W. Hinds.*

**Salvia Schimperii.**—For the last two or three years several of our leading seedsmen have advertised in their catalogues seed of this interesting species of Sage. In the spring of 1879 I bought a packet. I raised therefrom a strong stout-growing Labiate with spikes of bright lavender-blue flowers, which I at once saw could not possibly be the *Salvia Schimperii* figured in the *Botanical Magazine*, vol. 33, third series, tab. 6300, which has white flowers slightly tinged with pink. A few days ago I sent the plant for identification to Mr. Baker of Kew, and he informs me that it is *Coleus barbatulus*, which, like *S. Schimperii*, is a native of Abyssinia. It is rather a pretty plant for winter decoration in a large conservatory, but too coarse in its growth for a small greenhouse. I shall be glad to hear if any one has the true *Salvia Schimperii* in cultivation, as I much wish to obtain a plant. *H. Harpur-Crewe, The Rectory, Drayton-Beauchamp, Tring, May 3.*

**Stephanotis floribunda.**—We have a plant that has been laden with flowers since March 23, at which time we began cutting, and have since cut over 500 trusses, some of which have ten and eleven flowers, and there are at present 200 trusses open and opening. The plant is the same from which we cut 1200 trusses last year, as I stated last autumn, and I believe it to be a better variety than is in general cultivation, as it sets flowers at nearly every joint of growth it makes. *H. Howard, Castle Malgwyn.*

**Vanda Denisoniana.**—This a very chaste and valuable addition to the *Vanda* family. This ivory-white *Vanda* is exalted above others as being the only white one yet discovered, and Lord Lonsborough must feel proud in having such a beautiful Orchid named after him. Mr. Williams, in his *Manual*, speaks of the petals and sepals white and the lip white, but he does not speak of the yellow centre, or throat. Altogether this is a charming Orchid for flowering at this season, and worth a place in every collection of Orchids. It is, moreover, a good grower. *Henry Knight, Floors.*

**Fritillaria lutea, Miller.**—A few weeks ago I exhibited at the meeting of the Scientific Committee of the Royal Horticultural Society a large pale straw-coloured *Fritillaria* almost entirely destitute of tessellation, the bulbs of which I received from my kind friend, Dr. Regel, of St. Petersburg. Mr. Baker pronounces it to be *F. lutea*, Miller. *F. latifolia* of gardens is considered to be a variety of this species, but it appears to me a very different plant. *H. Harpur-Crewe.*

**Pyrus japonica.**—If this were a stove plant difficult to cultivate and get into flower what a deal it would be thought of, but as it is only a hardy shrub that will grow anywhere, it is seldom seen, and yet a more beautiful or striking object it is impossible to have. Effective as it is in the form of a loose bush, it is much more so trained on the surface of a house or wall built with white brick or faced with stone, the colour of which makes a fine background for the shining green foliage and brilliant blossoms that come in such profusion on the spurs and young wood. Being of a deciduous nature it can only be planted with safety during the autumn or winter unless it can be protected in pots, in which case, if got at once a season will be saved, as the plants will have time to make shoots and become established in their new positions before the summer gets far advanced. The soil that suits this *Pyrus* best is a loose sandy one, and a sunny spot is necessary to ripen up the wood, which should be laid in so as to fill thinly whatever

space is allotted to the plant, and all that forms in front may then be stopped or pinched-in after the manner Apricots are treated, when the spurs so induced will come crowded with buds. I have never tried it for pots for forcing, but from its early flowering habit it ought to be valuable for that purpose, as in February or March one or two in a conservatory would quite brighten it up. *J. S.* [Both it and *P. Maulei* are fine plants for forcing. *Ebs.*]

**Yellow Orchids.**—Those fond of yellow Orchids will find *Phajus maculatus* a very beautiful one, and being a winter-flowering species it will prove all the more valuable. The flower-spikes are not so long as those of *P. grandifolius* or *P. Wallichii*; sepals and petals golden-yellow, with a beautiful light brown lip, the two colours contrasting well, the combination is certainly most pleasing as well as rare. It is decidedly a plant as worthy of notice as those just named, and perhaps would be more to the taste of some persons. It is an easily-grown plant with the same treatment as *P. grandifolius*. The spike lasts long in beauty, and if cut on the first flower opening, and put in water, it will last two or three weeks. Mr. Williams in his *Orchid Manual* does not take notice of the lip, which I consider the chief beauty in this *recherché* Orchid; but he speaks of there being two varieties, so that the one may be all yellow while the other has this distinct brown lip in addition. *Henry Knight, Floors.*

**The Fruit Crop.**—Great as appeared the promise for Plums and Cherries, I fear the crop will not be more than an average one, for although the weather up till April 24 was favourable, the sap, so far as can be seen, is anything but good, the stalks and embryo fruit looking sickly and yellow. This no doubt arises in a great measure from the green and immature condition of the wood, and it is only natural that the blossom-buds should partake of the same character and lack finish, as may readily be seen in the crippled state of many; and if their outward form is such as to be apparent to the naked eye, the organs within are more than likely to be just as imperfect. The anthers, too, seem to be nearly barren of pollen, without which fructification is out of the question. To make matters worse, a spiteful north-east wind is blowing to-night, and this with a clear sky means mischief, so that the hopes and longings of gardeners for a favourable change in the spring are not likely to be gratified this year, and we shall have to see it out before the effects of the last vanish, as that has evidently left a legacy of evil that only the sun of the next few months can dissipate. Market-growers must have been sorely tried, and it shows the men they are, with all their heavy expenses and discouragement, to find them battling against all difficulties, and asking no help for agitating for reductions of rent, which, as is well known, in the majority of cases is so high as to leave little margin for profit after all the labour and attention they bestow on the land. *J. S.*

**The Old Dusty Miller Auricula.**—This is a floral beauty, though old in years. We have a row of it in full flower just now, 150 feet long and 18 inches broad, and it has a fine effect. The flowers, moreover, scent the air with their perfume. I do not know anything more *distingué* at this season out-of-doors than this old flower. It would be a grand flower for the London parks at this season, and even out of flower, for with its powdered foliage, it always looks well as an edging or broad band to any bed in summer. I send you flowers, as I am under the impression that it is somewhat different to what is known as the Old Dusty Miller, having a much larger truss of flowers. *Henry Knight, Floors.* [The flowers are large and showy, of a dark maroon colour, and very fragrant. The size of the truss is probably owing to good cultivation. *Ebs.*]

**Strawberries Flowering.**—It is noteworthy as a contrast to last year that Strawberries were in bloom the last week in April this year. Many have, however, been injured by the late frosts. *C. L., Hounslow, May 3.*

**Gardenias at Luton Hoo Gardens.**—I recently had occasion to visit these gardens, situated about two miles from the town of Luton, in Bedfordshire, and was struck with the magnificence of the display of *Gardenia intermedia* planted out in a centre bed of 25 feet by 6½ feet, numbering thirty-six plants, of a uniform height of about 3 feet 6 inches. Not being accustomed to such an extraordinary display, I was at a loss to know what to say or what question to ask first; at length came all information required. The plants were planted out by Mr. Batters four years ago in the raised centre bed (about 4 feet high). The total number of blooms cut to the date of my visit (namely, April 27) was 2800, and the quantity cut from April 20 to April 26, inclusive, was 164 dozen. The number of blooms, counted as well as circum-

stances would permit, I calculated to be over 5000 still to be cut. Forty-five dozen were cut the day previous to my visit, and I was shown a photograph taken a week previous of one side of the bed only, showing about 400 expanded blooms, so that nearly 1000 blooms, counting the ends, would be out at once, and all of excellent substance. Most of the flowering points have two blooms, and many of them three; in short the whole bed is a perfect mass of bloom. Now just a word as to the foliage. It is in most glorious health, and has not the "unhappy" appearance usually found with these subjects, and there is not a mealy-bug to be seen, in fact it is not known among the plants. *J. A. F., April 29.*

**Caladium argyrites.**—I was surprised at seeing *Caladium argyrites* recommended for growing for decorative purposes during the winter, as it is about the most tender of all the kinds, and would flag immediately if removed from the hot, moist air of a stove—the only place it could be kept alive in at that time of the year; and as scarlet *Pelargoniums* being associated with it there, to my way of thinking they would look more at home and succeed better in a house of another description, and with quite a different class of plants to *Caladiums*. Surely some of its own red-leaved congeners are more fitting companions to *C. argyrites* if contrast of that kind is needed, but there is an old saying that good wine needs no bush, and *C. argyrites* is so exquisite in itself that nothing can add to its beauty. There is one *Caladium*, however, that I have found particularly useful very late in the autumn, and that is Prince Albert Edward, which has stiff *Alocasia*-like stems and leaves of great substance, and these combined render it much more hardy and enduring as compared with the others. Its markings, too, are very lovely, and altogether it is second to none of the many fine things there are among the numerous sorts. *J. S.*

**The Orchids at Porthgidden, Cornwall.**—Amongst a number of Orchids flowering in the Rev. Canon Phillpott's collection at Porthgidden, near Truro, the following are particularly noticeable:—*Aerides Fieldingii*, a very fine plant; *Vanda insignis*, *V. suavis* and *V. Batemanni*; *Calanthe veratrifolia*, with twenty-four strong spikes of its beautiful white flowers; *Cypripedium barbatum*, with fifty flowers; *C. barbatum nigrum*; *Oncidium altissimum*, with seven spikes, 5 feet long, and beautifully flowered; and *Odontoglossum bictonense*, very strong. Of smaller specimens there are also in flower:—*Cattleya Skinneri*, *Cypripedium niveum*, *C. hirsutissimum*, *C. Roezlii*, *C. caudatum*, *C. javanicum*, *C. Pearcei*, *C. insignis*, *Dendrobium moschatum*, *D. Pierardi*, *D. albo-sanguineum*, *D. nobile*, *D. nobile coerulescens*, *D. densiflorum*, *Epidendrum elongatum*, *Lycaste Skinneri*, *Odontoglossum Pescatorei*, *O. Alexandræ*, *O. triumphans*, *Oncidium aureum*, *Sophronites grandiflora*, *Phajus Wallichii*, *Lelia majalis*, and others are coming into flower. *H. R.*

**Maréchal Niel Rose.**—A young half-standard on the ordinary Brier stock of Maréchal Niel Rose was planted against the back wall of a cool conservatory, south aspect, at the residence of Captain Mills, Norton Grove, near Malton, on April 17, 1877. The plant when planted had a liberal dressing of half-inch bones given to it, and since has occasionally had applications of liquid manure. The present spring it has attained to the following dimensions—its branches extending for 10½ yards wide on the wall, which is about 14 feet high. It has been for the past month in magnificent bloom, and has produced upwards of 350 very fine blooms, specimens of which are enclosed. I called upon the gardener, Mr. Winn, the other day, and observing the magnificent growth and fine display of flowers on the plant, thought a short notice of it worth recording. *Matthew B. Slater, Malton.* [The blooms sent are magnificent examples of this splendid variety. *Ebs.*]

**Alexandra Park, Manchester.**—Manchester and Salford are well circumstanced for public parks, the former having four and the latter the same number, all kept up by the two corporations, and in as good a condition as climate and situation will permit. For some years the different parks have been embellished in the spring-time by a display of Dutch flowering roots, consisting of Hyacinths, Tulips, Crocus, and Snowdrops, but principally Tulips. The parks committees deserve great credit for their endeavour to please the public by requesting the curators of the several parks to plant a portion of the flower-beds in the autumn for early spring bloom, and this can now be done at a limited cost as the price of many leading Tulips is exceedingly moderate. What is more cheerful to the pent-up citizens in the early spring months when they take their daily walks through these open spaces and find for their admiration the beautiful combined with healthy recreation. Having heard of the display in previous years that Mr. Manderson, the enterprising curator of the park above-named has had, I was led the other day to visit and

inspect the great show of Tulips now in flower. Entering the principal gateway I observed a long vista of colours carefully harmonised, and on closer inspection I found the beds tastefully planted, some with different varieties, others with self colours. To particularise a few of the most striking sorts that have the greatest effect, and the varieties most suitable for the climate, may be doing a service to those who may wish to see them and also to those who may desire to take note for a coming season to plant such varieties as do well under similar or better circumstances. Taking the semicircular walk to the left on entrance I found a number of different sized and shaped beds nearly all filled with Tulips, amongst which I note the most striking—Kaiserkroon, orange and scarlet, which makes a most attractive bed; Prince of Austria, buff-orange, excellent for beds; Cottage Maid, rose and white, dwarf, the best light coloured variety for bedding purposes. Reaching the central walk, which runs to the terrace, I found fifteen to twenty circular beds on each side, filled with Tulips, each corresponding in colour to its opposite neighbour, and tastefully blended; of these the most prominent were Dussart, dark crimson, dwarf in habit, good foliage, and flowers of great substance; this is without doubt the best bedding Tulip amongst the dark colours; Crimson King, brilliant scarlet, very effective; White Pottebakker, white, rather tall, and easily soiled in a smoky atmosphere; Van der Helst, scarlet and white, very good; Chrysolora, bright yellow, the best yellow grown; Scarlet Van Thol, dwarf and effective in colour, but rather too early, being past its best. Returning to the point of departure from the footpath, and taking the semicircle again, I found the same number of beds planted with the same varieties, running up to the end of the terrace. There are numerous other varieties in flower, but to enumerate them all would take up too much of your valuable space. I may remark that several of the beds have been filled with Hyacinths; the season however has been much against them, and the curator informed me that he found Tulips much more effective than Hyacinths, lasting longer, and consequently he had not planted many. In a few weeks all the beds on the terrace will be planted with bedding plants; and from the resources at command in this department the public may expect a rare treat in the course of the summer months, worthy the well known reputation of the curator. Many alterations have been carried out of late for the improvement of the park, in an artistic point of view. *A Visitor.*

**Slugs.**—I am quite sure, from painful experience, that severe winters have not the slightest effect in diminishing these pests. Last year I flattered myself that the supply of slugs was diminished, but as soon as a few warm showers fell, they came swarming out with unabated voracity. I suspect the severe cold had induced them to burrow deeper below the surface, so that they came up rather later than usual. This spring they are again in great force, and I can only hope to rear tender plants by waging an incessant warfare against them. I have no doubt a great many slugs fall victims to lime, which I always use in digging and planting vegetables—but its virtue is lost the moment it gets wet. The most effectual trap I find to be grains from the brewery. A handful of grains, covered with a bit of slate or board, is an irresistible attraction, and the slugs must smell it from a considerable distance, for I have sometimes caught nearly a hundred in one place. My gardener has had the curiosity to keep an account of the slugs trapped this season, and the number already amounts to about 13,000. "The cry is still, they come," but at all events there are 13,000 mouths less to feed, and so many more chances of escape for the young plants. I have heard orange-peel highly recommended as a slug-trap, but to supply a garden of the moderate extent of mine it would be necessary to employ all the parish school boys to suck Oranges for the purpose. [They would not be sluggish in the matter.] *G. H. W., St. Mary Church, Devon.*

**Removing Tree Stumps by Tonite.**—The removal of tree stumps is being carried on here on an extensive scale, with the object of improving the landscape, and also to bring the land into cultivation, in preference to replanting it with timber. Before commencing operations the most reliable authorities were consulted as to the best method of getting the stumps out of the ground, and nearly all agreed that the most economical and expeditious method was to blow them out with dynamite, or some other powerful explosive. Tonite was selected, as it is a very safe and also a very powerful explosive. It is exploded in the same manner as dynamite. A piece of ground was marked out, the stumps counted, and the men set to work in exactly the same manner and with the same tools described by Mr. Smith, of Mentmore, on p. 531, a gentleman experienced in the use of the explosive being present to instruct the men. Nearly all the stumps were blown out in a most satisfactory manner; in a few instances, however, the soil was blown

out from under the stump, and the stump itself split up through the centre, which rendered it an ugly customer to deal with. It could then only be got out by placing some large stones in the hollow, and laying a few cartridges on them close up under the least injured portion of the stump, and firing again. After the number of stumps to be experimented upon had been blown up, such roots as remained were dug out, and the ground cleared; the cost was calculated, and everything was so satisfactory that it was decided to go on with the use of explosives. But before doing so it was decided that digging them out should have a trial, and accordingly a few good labourers were set to work, who, as they went on, found out the best way to do the work, and also the most suitable tools; and in the end it was discovered that they could be got out in a more economical and efficient manner by digging than by blasting. The work has since been done by contract. The conditions were that the stump was to be dug out with all the roots that were near the surface, and the hole refilled, and it was found that it could be done at about half the cost of blowing them out. Of course when dug out entire they are not so convenient for handling as when blown to pieces, but the smaller stumps can be carted away, and the larger ones rolled on to a trolley, and so drawn to somewhere out of the way, as they cannot very well be utilised for fuel. I may add that our soil is deep, light, and sandy, and in a soil of that nature an explosive would not have the same effect on a stump as it would in a soil that was closer and more retentive. *G. Grijjin, Slebeck Park Gardens, Pembrokeshire.*

**Double Zinnias.**—Those who have never grown these or seen them in masses can have no idea of the grand display they make, or of the great service they are for filling large beds, where, if mixed judiciously so as to blend the various colours, they produce a most striking effect and are perfectly dazzling to look on. Unlike Asters that get much injured by heavy rains, Zinnias are all the brighter and better for the washing, their stiff stems being sufficiently strong to hold the flowers erect, and as the petals are thick and throw off water readily, wet does them no harm. Not only are they grand in beds, but they form fine groups in borders arranged in patches of three placed triangularly about 6 inches apart, grown in which way it is best to have each patch of the same colour so as to appear as one plant. Being rather gross feeders and fond of good soil, the situations chosen for them should be specially prepared by breaking the ground well up and digging into it some thoroughly rotten manure, keeping the same down that it may be buried out of reach of the tender roots for a time till they become more active in response to a corresponding movement taking place in the tops. When I first took up the culture of Zinnias, I found they suffered much by being raised too soon. We never sow the seed now till the end of April or beginning of May, which is quite early enough, as the plants are very tender and are sure to become stunted by being kept about, or, what is quite as bad or worse, if long under glass they get drawn and have attenuated shoots, too feeble to stand. To prevent this, the best plan is to sow very thinly in boxes or pans, which, as soon as the young plants are up, should be elevated so that they can have plenty of light, for during the early stages the stems elongate at a great rate, especially if there is a deficiency of air or too much heat at the time, which often happens if the boxes are not at once removed from the positions they are first placed in to induce the seed to germinate. A gentle hotbed is the most suitable situation for this, but when fairly up and hardened a little the plants may be pricked out in any frame, where, if protected till towards the end of May, they will be quite strong enough for transferring to the summer quarters. To afford them plenty of room, the rows ought not to be nearer than 1 foot, and the plants should have the same distance allowed from each other, as then they branch freely and continue to flower till destroyed by the frost. As they are fond of heat, it is important that the site chosen should be a sunny one, and if sheltered from wind all the better, for when exposed the weight of their heads renders them liable to be knocked about by its force. *J. S.*

**The Outlook from a Garden Point of View.**—The excitement of the election is now over, I am glad to say. Let us now turn to what interests horticulturalists and floriculturalists. I never saw the Peaches and Nectarines under glass, without fire-heat, better, nor worse out-of-doors. Out-of-doors the blossoms are few and weak, but the trees are finely in foliage with scarcely a sign of blister (the number is 121). The following are good under glass, namely, Early Silver, Barrington, Early Louise, Early Alfred, Grosse Mignonne, Royal George. The failure out-of-doors arises chiefly from immaturity of wood. So cold and unfavourable was the weather that the trees did not form blossom-buds, but the trees (small) are most healthy. I believe that unhealthiness in these trees arises from the disbudding of the Peach trees, during

the time the sap is rising in tides. Disbudding should be done gradually, and should not be done till every leaf is unfolded. Then a blistered shoot can be taken off, and a sound one left on! If trees are rigidly disbudded, there may not be foliage left on sufficient for deportation; hence a gummy residuum left in the tree, and when the sap rises the next spring the gummy residuum is carried up with the sap, and cannot find outlet at the leaves. Though my garden is open to the east, south, south-west, in a most severe part of the Vale of Blackmoor, except on certain trees given to blister I see no such thing. I have a volume more to say of these interesting fruits, but I must pass on. Pears have but few blooms: most varieties have none. Apples will, I fear, be a short crop, as they formed but few bloom-buds. They looked last summer (aqueous summer) as if fire had passed over them. I thought many orchard trees were dead, but I am glad to see that they put forth leaves, though blossoms are few. Gooseberries, Raspberries, Currants, red, white, black (Black Naples is excellent), Strawberries (Rivers' Eliza—the only one I keep), are grand. Cherry trees are well-bloomed, they look like pyramids of Snowdrops, and as the poor little marauders are dead I may hope to get a bite. Plums are not forward enough to judge. My best culinary trees are Diamond, Mitchellson, Dove Bank, Belle de Septembre—the late much beloved Mr. Rivers' selection. Violette de Galopin and Reine Claude Rouge are delusions. Peas are excellent and a good successional selection—King-leader, Princess of Prussia, British Queen. Carrots are a failure. Parsnips and Onions, and Broad Beans (Johnson's Wonderful), are very good. Asparagus is not yet up; Seakale very fair. People had better make new beds of these, as, unless protected, the severe winter must have injured them. I consider Seakale, Asparagus, Turnip-tops, Watercress and Rhubarb are our best early vegetables. Watercress may be grown in frames with a water-saucer under the pots. I have a little pond about 20 feet in diameter (circular), in front of my drawing-room window. I tried eels and trout, which failed; so I threw in some stems and roots of river Watercress, which took well, and I am now eating the capital result. People should utilise it; it is surprising how much natural wealth is lost by bad cooking, waste, and non-utilisation of such things as Watercress. The Roses are alive and have broken well, but, as yet, are universally blind. The shoots must be cut back gradually to within half-an-inch of the branch. *W. F. Radcliffe, April 26.*

**Autumn Strawberries.**—It would be well for the inexperienced in Strawberry culture to use caution in adopting or following the system recommended by Mr. Hinds in a recent *Gardeners' Chronicle*, as to obtaining a crop of fruit through and late in the autumn. Mr. Hinds gives the most favourable views as to obtaining such results, but he does not state the drawbacks to be considered. That spring forced plants planted out carefully, and tended through the summer as to watering, keeping clean, blooms and runners kept picked off, &c., will produce enormous crops of fruit the following year, is well known. The planting out of such is a practice to be highly recommended; but those self-same plants if allowed to flower and carry a crop of fruit through the autumn would to my mind produce so much the less the following year. Neither would the results be worth the trouble, at least on a large scale, as plants planted out, if allowed to go on flowering and fruiting, would be exhausting the little vitality left in them, unless continually fortified by feeding with manure-water, mulching, &c. Then, considering the necessary labour, and the loss of crop that must result the following year, I fear the experiment would end in disappointment. Further, the fruit produced would be small, as the plants not being well established in the ground would lack the necessary vigour to swell up and ripen off such fruit as we get from well established plants planted out and tended through the summer as above described. The process also of ripening such fruit in the autumn outdoors is so slow that between birds (the most plentiful and most ravenous after fruit) and slugs, a grower would get but a poor return for his trouble. To carry out Mr. Hinds' recommendation on a small scale for the sake of having a dish or two of Strawberries at that time of year, may be advisable; but further than that, so far as my own observation and experience of Strawberry growing has gone, it could not be worth the trouble. Success in obtaining autumn Strawberries would very much depend upon a nice open dry time, and the needful assistance to attend to the plants' requirements. *E. Williams.*

**Phlox Nelsoni and Lithospermum prostratum.**—Of all the procumbent-growing Phloxes this is the most desirable, as plants of it flower with such freedom as to appear a mass of white, pure as driven snow, which seen as we have them here, behind a row of the lovely cobalt-blue *Gentiana acaulis*, produce a most pleasing effect. Being of a close trailing habit,

they are just the thing for mounds or depending over rock, where they associate well with *Lithospermum prostratum*, a plant that should be in every garden. One I saw lately covers more than a square yard of ground, and will soon be a fine sight, as it is smothered with blossom-buds, which when expanded will afford choice bits for working up in bouquets. *Leschenaultia biloba* used to be thought much of, but here is a plant quite hardy rivalling it in the beauty of its flowers and yet almost unknown. What a splendid thing it would be in a basket hanging down a foot or two over the sides, clothed with those deep intense blue flowers, of a shade so rare among the plants. To grow this and the Phlox well they should have a sunny spot and deep light sandy soil, in which they soon spread and form thick masses of verdure. *J. S.*

Notices of Books.

*Les Orchidées, &c.* Par E. de Puydt. Paris: Rothschild; London: Dulau & Co. Large 8vo, pp. 348, woodcuts 244, coloured plates 50.

It is not long since we had occasion to comment on the elegant volume of M. de Kerchove on the Palms, and now we have the pleasure of bringing under the notice of our readers a companion volume devoted to the Orchids. The chapters comprise an historical sketch, details of structure and classification, indications of geographical distribution and climatology, treatment and cultivation, injurious insects, and a slight account of the principal genera cultivated in Europe. This is an ample programme—one, moreover which could not be fully dealt with in one, nor indeed in many volumes. All that can be looked for is a general outline, and if this be done correctly and in an agreeable form, the Orchid lover and the general reader should be content, as those whose predilections and studies demand fuller information generally know where to look for it. Hence it is not to be wondered at if some of the chapters we have mentioned are rather meagrely treated. But while we assent to this as a matter of necessity we have a right to demur to diffuse and long-winded paragraphs intended, so we are told, for definitions. It is thus when we are invited to enter upon a more scientific order of ideas, as no definition of what an Orchid has hitherto been given, that we meet with a rhapsodical effusion about the advent of spring and the flowering of the spotted Orchid, not very long in itself, it is true, but followed by a long descriptive paragraph or series of paragraphs without anything that can be called a definition. By the general public, who have no love for precise definitions, this defect will not perhaps be noticed, but to us it is the more noteworthy, inasmuch as in the sub-divisions of the order neat definitions, adopted from Lindley, are very properly given. The morphology of the Orchid flower—one of the most interesting studies in this most interesting family—is hardly more than touched on, and Darwin's book on the *Fertilisation of Orchids*, with its wealth of accurate detail and interesting statement, might never have been written for all the mention made of it by M. de Puydt. Again, although the polymorphic flowers of *Catasetum* are mentioned, not a word is said as to the explanation given by Darwin of a fact which attracts the attention even of the most incurious. The geographical distribution and climatal surroundings of Orchids are more satisfactorily treated, and then follows a brief account of the collecting of Orchids in their native country, and of the proper way of unpacking and managing recently imported Orchids. The best modes of constructing and heating Orchid-houses are discussed in a chapter all too brief, though it must be admitted that English cultivators have little to learn in the matter of Orchid culture from their Continental brethren.

The second portion of the work consists in an alphabetical list of the principal genera in cultivation, with a brief and by no means diagnostic account of

their characters, and an indication of the more important species. Lastly come the fifty coloured plates of leading Orchids with a minimum of descriptive text, but with fuller directions as to culture. The figures are well and correctly drawn, but the colours are often not happily rendered. The work is also profusely illustrated with woodcuts, a considerable number of which have appeared in our columns, and the use of which is duly acknowledged. To the beginner and to the dilettante student this book may be recommended as an introduction to more complete and thorough studies.

**Forestry.**

Now that the planting season may be regarded as over there are various little things requiring attention, which should, as far as possible, be done before barking and other important works are commenced.

**THE PINETUM.**—All the ornamental trees and others in the policies should be carefully gone over and examined individually. All broken, and decayed, and damaged branches should be removed, and the wounds carefully and artistically dressed. Any trees that have supports to them or ligatures upon them should be closely examined to see that the bark is not galled or unduly compressed, or likely to be so, before the annual growth is completed. Any trees that have been wholly or partially uprooted by the wind during winter and are capable of being set erect with a view to establishing and perpetuating their growth should be so operated upon as to accomplish that end. Small trees, and even medium sized ones, may be raised and re-established with only a rope attached and the efforts of a few strong men. Large trees, however, such as Lime, Sycamore, Elm, and Oak frequently require mechanical appliances to raise them, the best of which is the new patent block and tackle apparatus, which is capable of raising an immense weight with the aid of a few men. It is often advisable, and not unfrequently indispensable, to lop off a portion of the top branches before raising the tree. This operation, though apparently objectionable on account of disfiguring the tree, is yet of immense advantage in several respects. It so far lightens the top of the tree as to render its erection quite a simple and easy matter compared with what it would otherwise have been. Another advantage of reducing the weight of the top of the tree is that it reduces its liability to be blown over again after being set up, which it would naturally be inclined to do unless very strongly secured by anchorage.

Hedges also require to be carefully looked over, young and tender ones protected by means of palings, wire netting, &c. Old ones that have not been pruned or cut over should be so with as little delay as possible. All drainage should be attended to, so that no stagnant or superfluous water be allowed to injure their roots. Cleaning, but especially digging, should be prosecuted with all diligence, and in doing this work care should be taken to avoid injuring, by cutting, the roots of the hedge plants. Many ornamental and rare trees are planted in the pleasure grounds in soils altogether uncongenial to their nature; such trees require, from time to time, to have a trench dug round them a little within the radius of their branches, and the trench filled up with suitable soil. After a few years, the roots will have occupied and to some extent exhausted the soil, and therefore another trench must be dug beyond the last one, and it also should be in like manner filled with earth. Such work requires to be finished as soon as possible, as the roots have in many instances already prolonged their fibres, and therefore any disturbance or abrasion of them now is very hurtful.

All trees that had been planted when of advanced growth or large size are very liable to sink too deep into the ground after the earth subsides, the tree being thereby placed, as it were, in the centre of a concavity or basin. Trees in that position never succeed well, but, on the contrary, are short-lived, and always sickly. All such trees should be raised up by means of levers, and sufficient earth put in below them to keep them considerably above the level of the surrounding ground.

The general state of health of all trees, but especially ornamental and rare ones, should be carefully examined into and remedies applied, according to what appearances suggest. In damp situations, where the soil is clayey, there is a strong tendency and disposition of the trees to become covered with

moss and lichens. Now, while there is no real and reliable cure for this, more than for anything else that does not remove the cause of the disease, yet the moss and lichens, though possessing in an eminent degree their own peculiar beauties and attractions, may, and probably do to some extent, injure the growth of the trees by choking the air-cells of the bark, and engender bark diseases, just as filth in the animal engenders skin diseases with their accompanying maladies. To prevent or cure this moss and lichen complaint, a very simple remedy is found in R. Davidson's composition, recommended for preventing game injuring the bark. Having used the composition rather extensively, not to kill moss and lichens, but to protect the trees from game damages, I am happily surprised to find the appearance of the bark of the trees so greatly improved that the idea is suggested of anointing the whole surface of the bark of the trunks and stems of the rare and ornamental trees where much covered with moss, &c. The composition is simply rubbed over the bark with a brush or with the hand, and is evidently productive of very pleasing and satisfactory results in the way of cleaning the bark and imparting to it all the appearance of a young, healthy, and vigorous growth. *C. J. Michie, Cullen House, Cullen, April 27.*

**Reports of Societies.**

**Spring Flower Show at Chiswick: April 29.**—A Fellow of the Royal Horticultural Society of thirty years' since, revisiting the favoured site of the Society's most famous exhibitions, might well have imagined on the 29th ult. that something akin to the palmy days of old Chiswick had come again. 'Tis true the day was cold, as April days in the time of the Blackthorn winter will be, but the sun shone out gaily, and tempted many hundreds of the residents of the marvellously expanded neighbourhood to brave the wind, and enjoy at once the delightful gardens and the strains of music which emanated from the splendid band of the Scots Guards stationed near to the old Council-room. It was not, however, the Horticultural Society that was *en fite*. Some of the residents in and about Turnham Green, feeling that the absence of any flower show in that locality, so famous in the memories of a past generation as the scene of the origin of floral exhibitions, was a misfortune, thought something should be done to remove it, and taking Mr. Barron, of the Horticultural Gardens, into their confidence, a way was soon found to establish that which was so ardently desired. Just by the entrance to the gardens, or rather close to the new entrance (for Chiswick is fast being improved in some of its exteriors beyond the knowledge of ancient *habitués*) stands the new and commodious Vestry Hall, and this presented exactly the place in which to hold a spring flower show. The matter was so experimental that it was resolved, in order to invoke the aid of the residents of the locality, that any profits after all expenses were paid should go to the West London Hospital, a very worthy local institution; and either this benevolent object or the inspiring prospect of a flower show so far acted upon the breeches pockets of the good folks of Chiswick that a large sum was subscribed beforehand, and so much was taken at the doors that it will quite make the treasurers of provincial and indeed metropolitan horticultural societies mouths water to learn that, having regard to the means, a very considerable sum will be handed over to the hospital. Doubtless through Mr. Barron's kind intervention the Council of the Royal Horticultural Society permitted the Chiswick Gardens to be thrown open free to all visitors to the show, and these, including the band, presented attractions of an unusual character. The gardens were in excellent order, the houses well furnished and full of interest and some of great beauty; and it will be indeed a surprise if a large number of the near residents do not as a result of their visit, and seeing the many advantages offered, soon become Fellows. Perhaps the Council may some day think that it is hardly worth while longer casting their floral pearls before the thankless South Kensington people, and with a vast and new population grown up around their Chiswick Gardens, will see if it is worth testing how far some of the glories of the old days may be revived. Of the show itself, as an exhibition of tender and hardy spring flowers, it is difficult to write in too high praise. The hall might well for the purpose have been larger; but as it was not, the plants so liberally sent by many of the leading London nurserymen had to be somewhat crowded, none the less the glowing colour, tempered by luxuriant ornamental foliage, was all that could be desired. From the Chiswick Gardens came a quantity of fine decorative plants which, in conjunction with a very handsome lot of Conifers in pots, sent by the Messrs. Fromow & Sons, of Turnham Green, lent an air of elegance and beauty to the entrance vestibule. In-

side a very prominent feature was the collection of six foliage plants, consisting chiefly of Palms staged in the orchestra recess by Mr. Hudson, gr. to H. J. Atkinson, Esq., of Gunnersbury House, and to which the 1st prize in the class was awarded. Below these, arranged in semicircular shape on the floor, was a group of hybrid perpetual standard Roses in pots, sent by Messrs. Veitch & Sons, of Chelsea. These were edged and dressed with the charming cut-leaved varieties of the Japanese Acer, and made a brilliant display. A notable group at the other end of the hall, consisting of Palms and various variegated foliaged plants, with many small baskets of miniature Palms and Ferns just suited for drawing-room tables, came from Mr. Herbst, of Richmond Road, Kew, and were greatly admired. Messrs. Hooper & Co., of Covent Garden; Mr. B. S. Williams, of Holloway; the General Horticultural Company; Mr. Aldous, Gloucester Road; and Messrs. Osborn & Sons, of Fulham, all had fine decorative groups of plants that were most useful in making the show. Messrs. Paul & Sons, of Chess-hunt, sent three boxes of cut Roses, two of these being grand flowers of Maréchal Niel; from Messrs. Barr & Sugden a large collection of cut Narcissus and border Tulips; and from Messrs. J. Standish & Co., of Ascot, a box of splendid bloom of Gardenias. Of collections of plants from other sources, perhaps the finest was from the gardens at Gunnersbury Park—Mr. Roberts, as one of the show committee, supporting the exhibition with a splendid group and many plants of great excellence. Mr. May, gr. to the Marquis of Bute, Chiswick House, sent some good things, including several noble Callas, and a box of cut Camellias. Mr. R. Dean staged a large group of hardy plants, including Auriculas, Primulas, Wall-flowers, &c. Mrs. Hudson had a charming dinner-table arrangement, and Mr. Hudson was a successful exhibitor in several classes. The chief of the other competitors were local residents, but owing to the newness of the show these were not large in number.

**The Weather.**

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MAY 5, 1880.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.		Hygrometrical Deductions from Glaisher's Tables 6th Edition.	WIND.	RAINFALL.

April 29.—A fine day, partially cloudy. Windy. Cold day. Cloudless, and raw cold at night.  
 — 30.—Overcast till 11 A.M., fine and bright after. Very cold and cloudless at night.  
 May 1.—A fine bright day. Cloudless, and very cold at night.  
 — 2.—A very fine, bright clear day. Slight frost in early morning.  
 — 3.—Fine, but dull and cloudy till 3 P.M. Smart showers and slight thunderstorm, 3.30 to 4.30 P.M. Fine and bright after 6 P.M.  
 — 4.—A dull, cloudy day, though fine. Cold. Gleams of sunshine at intervals.  
 — 5.—Overcast and dull throughout. Occasional rain. Cold and windy.

**LONDON: Barometer.**—During the week ending Saturday, May 1, in the vicinity of London the reading of the barometer at the level of the sea increased from 29.98 inches at the beginning of the week to 30.20 inches by the morning of April 27; decreased to 30.05 inches by the afternoon of the 28th; increased to 30.44 inches by the morning of the 30th; and decreased to 30.08 inches by the end of the week. The mean reading for the week at sea level was 30.17 inches, being 0.19 inch above that of the preceding week, and 0.22 inch above the average.

**Temperature.**—The highest temperatures of the air

observed by day varied from 60½° on April 30, to 50° on the 26th; the mean value for the week was 54½°. The lowest temperatures of the air observed by night varied from 33° on April 27, to 44° on the 25th; the mean value for the week was 37½°. The mean daily range of temperature in the week was 17½°, the greatest range in the day being 24½° both on April 30 and May 1, and the least 11°, on April 26.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—April 25, 49°.2, + 1°.1; 26th, 43°.3, — 5°.2; 27th, 41°, — 7°.7; 28th, 43°.5, — 5°.4; 29th, 45°.2, — 3°.9; 30th, 46°, — 3°.4; May 1, 45°.4, — 4°.4. The mean temperature of the air for the week was 44°.8, being 4°.1 below the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 145° on April 29, 143° on May 1, and 125° on April 25 and 30; on the 28th the reading did not rise above 66°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 22½° on May 1, 26½° on April 26 and 30, and 30° on the 25th and 27th; the mean of the seven lowest readings was 28½°.

*Wind.*—The direction of the wind was N.E.E. and N.E., and its strength strong generally.

The weather during the week was fine and bright, but cold, especially the mornings and nights.

*Rain* fell on April 26, the amount measured was 0.05 inch.

**ENGLAND: Temperature.**—During the week ending Saturday, May 1, the highest temperatures of the air observed by day were above 62° at Truro, Leicester, Cambridge, and Sheffield, and below 57° at Norwich, Leeds, and Bradford; the mean value from all stations was 59½°. The lowest temperatures of the air observed by night were below 31½° at Truro, Cambridge, Wolverhampton, Nottingham, Sheffield, and Hull; and above 36½° at Plymouth, Norwich, and Sunderland; the mean value from all places was 32½°. The extreme range of temperature in the week was above 33½° at Cambridge and Sheffield, and below 22° at Plymouth, Norwich, and Liverpool; the mean range of temperature from all stations was 27°.

The mean of the seven high day temperatures was above 55° at Truro, Plymouth, Leicester, Cambridge, Nottingham, and Sunderland, and below 53° at Brighton, Norwich, Wolverhampton, Liverpool, and Bradford; the general mean from all places was 54°. The mean of the seven low night temperatures was below 36° at Bristol, Wolverhampton, Nottingham, Sheffield, and Hull; and above 40° at Plymouth and Norwich; the mean from all stations was 37½°. The mean daily range of temperature in the week was above 19° at Leicester, Cambridge, and Nottingham, and below 13½° at Brighton, Norwich, and Liverpool; the mean daily range from all places was 16½°.

The mean temperature of the air for the week from all stations was 44½°, being ¾° higher than the value for the corresponding week in 1879. The mean temperature was above 46° at Plymouth and Sunderland, and below 43° at Wolverhampton and Hull.

*Rain.*—The falls of rain were small everywhere, at Leicester, Cambridge, Hull, Bradford, and Leeds a little over two-tenths of an inch was measured, but at Bristol 0.01 inch only fell; at Wolverhampton no rain fell. The average fall over the country was 0.12 inch.

The weather during the week was generally fine and bright, with cold north-east and east winds.

**SCOTLAND: Temperature.**—During the week ending Saturday, May 1, the highest temperatures of the air observed by day varied from 63° at Dundee, Greenock, and Perth to 56½° at Aberdeen; the general mean from all places was 60½°. The lowest temperatures of the air observed by night varied from 31° at Edinburgh, Paisley, and Perth to 34½° at Glasgow and Greenock; the mean from all stations was 32½°. The mean range of temperature from all places was 28½°.

The mean temperature of the air for the week from all stations was 45½°, being 2½° higher than the value for the corresponding week in 1879. The mean temperature was above 47° at Glasgow, and below 45° at Aberdeen and Perth.

*Rain.*—The heaviest fall of rain was 0.65 inch, at Aberdeen; and the least fall 0.05 inch, at Dundee. At Greenock no rain fell. The average fall over the country was 0.18 inch.

**DUBLIN.**—The highest temperature of the air was 62½°, the lowest 30½°, the extreme range 32°, the mean 43½°, and the amount of rain 0.02 inch.

JAMES GLAISHER, F.R.S.

## Variorum.

**THE TELEPHONE IN THE NURSERY.**—To expedite the needful constant communication hitherto carried on by means of messengers Messrs. James Dickson & Sons, of Chester, have now established permanent telephone communication between their chief office, 108, Eastgate Street, and their nurseries at Newton. The convenience of this instantaneous communication not only to the Messrs. Dickson in daily carrying out their multifarious internal business arrangements, but to their customers and others who, calling at Eastgate Street, may wish to make an inquiry at the Newton Nurseries, or *vice versa*, cannot be over-estimated. This is, we believe, the first telephone established in the district.

**THE DAHLIA TRADE.**—If the Dahlia is less grown than it was a few years ago for show purposes, it is quite certain it is in very large demand for general decorative uses, and the leading nurserymen who make a speciality of this popular flower have to propagate enormous quantities for a season's consumption. The work of propagation commences in February, and a house or two is devoted to it. The roots are placed in soil spread on a bed heated with hot-water pipes and partly covered with fine soil. A number of shoots are put forth round the neck of the root at that point where last year's stalk was cut away, and when these are some 3 to 4 inches long they are inserted in pots, so many in a pot, according to the size, and the pots placed in close pits heated with dung or hot-water, and where there is a brisk moist heat. Here they put forth roots in ten days or a fortnight, when the rooted cuttings are potted singly into thumb-pots, and again returned to a brisk heat. They are next removed to a warm frame, but of a lower temperature; then air is gradually given, and the plants finally removed to a cold frame, which is kept covered by night, to avert danger from cold, while air is given by day on all favourable occasions. In this way the plants are kept dwarf, stocky, and vigorous. At propagating time each pot of cuttings is carefully numbered, and when the plants are potted off singly a number is put in each pot answering to that under which each variety is kept in the nursery room, for it is much easier to write a number than a name. As the cuttings produced from the various varieties are taken off when ready, it is obvious that they get much mixed up together, and during the month of April it is necessary to get the different varieties separated for the execution of orders. Advantage is taken of a fine morning to do this: a number of hands set to work and get each variety into groups, and when sorting is accomplished they are returned to the frames, beginning with the lowest number and going on to the highest. The plants are then sprinkled overhead, the lights shut down close, and orders can now be executed with rapidity. Unless the plants have been shifted into larger pots, they become quite pot-bound, and all that is required in the way of packing for transit is to put a stake to each plant, secure the stem to it, and they are ready for packing. A very large number of plants can be put into a willow hamper: the pots are laid along close to the wide sides, the heads of the plants being in the middle, and all is made tight and secure with layers of soft moss. A basket of Dahlias carefully packed in this way will go for a long distance without injury to the plants, and when they reach their destination are soon recovered by placing them in a cold frame, sprinkling them overhead, and keeping them close for a time. Thousands are sent far and near in this way with but a very small percentage of accidents. The plants that remain unsold are kept in the frame, well watered during the summer; turned out in the autumn when the plants have dried off, and then sold during the winter as pot roots. Some varieties show better exhibition flowers when grown from pot-roots, instead of from cuttings taken in spring from ground roots; but that is one of many points of interest concerning the Dahlia that is taught by experience.

**THE ADULTERATION OF ARTISTS' MATERIALS.**—The system of adulteration which in these days is carried to such extremes, appears not only to affect our food, our drugs, and our articles of clothing, but even artistic productions; and the pictures of artists of the first reputation suffer from this crying evil of our time, and we think artists, properly so called, are greatly indebted to Mr. W. Holman

Hunt for his excellent paper on "The Present System of Obtaining Materials in Use by Artist Painters as compared with that of the Old Masters," which was read before the Society of Arts on the 21st ult. Mr. Hunt points out the deterioration generally, not only of pigments or colouring matters, but also of varnishes, oils, and even of the canvas itself, the effects of which are prejudicial to the picture either in point of colouring, cracking, or some other change, all of which were guarded against by the old masters. On the subject of oil alone, which Mr. Hunt refers to as an important one, he says that before the Crimean War the Linseed for making oil came principally from ports of the Black Sea. The practice which then prevailed in the trade was to empty into the hold of the vessel one measure of Hemp or other common seed to thirty-nine of Linseed. This was called legitimate adulteration. The war destroyed this trade, and Linseed was subsequently brought from India, where the quality was inferior and where carelessness in planting and reaping the crops caused the seed to be much more extensively mixed, but in addition to this inferiority the trade had thought it well to advance its legitimate adulteration to the extent of one measure to every nineteen. Mr. Hunt further says that it was impossible to find pure linseed-oil in all England, and to procure it the seeds had to be "carefully sorted out one by one by the fingers." It is a well-known fact that unadulterated Linseed is most difficult to obtain, various other seeds, oleaginous and otherwise, being largely mixed with Linseed from all the ports of shipment. Some kinds are, of course, much purer than others, and we should imagine that by a system of careful screening really pure linseed-oil might be obtained easily for artists' use. The question of the genuine nature of artists' materials is one of really great importance, inasmuch as it affects the character of the works of our greatest painters in this generation in future ages, as well as the reputation of the artists themselves.

"POETRY OF A ROOT CROP."—We take the following, by the late Charles Kingsley, from the pages of *Macmillan*:—

"Underneath their eider-robe  
Russet Swede and Golden Globe,  
Feathered Carrot, burrowing deep,  
Steadfast wait in charmed sleep;  
Treasure-houses wherein lie,  
Locked by angels' alchemy,  
Milk and hair, and blood and bone,  
Children of the barren stone;  
Children of the flanging air,  
With his blue eye keen and bare,  
Spirit-peopled smiling down  
On frozen field and boiling town—  
Boiling town that will not heed  
God His voice for rage and greed;  
Frozen fields that surplined lie,  
Gazing patient at the sky;  
Like some marble carven nun,  
With folded hands when work is done,  
Who mute upon her tomb doth pray,  
'Till the resurrection day."

## Answers to Correspondents.

**ALTERNANTHERAS:** *A. B. C.* The marked one is *A. paronychioides major*; the other is *A. amœna*.

**AURICULA:** *W. P.* Your double Auricula is of no particular value, though interesting, its defect being the dull dirty yellow colour. Were it bright and equally double, it would make a good border variety.

**AURICULAS, &c.:** *A. M.* For Auriculas, Mr. Turner, of Slough; for Polyanthus, Mr. Dean, of Ealing.

**CAPE COLONY:** *E. W.* Mr. W. C. Burnet, 10, Blomfield Street, E.C., is the Cape Colony Emigration Agent.

**CUCUMBERS:** *F. H. M., York.* Your plants are suffering from the well-known disease called gumming, the cause of which has not yet been established. The most efficient remedy is a complete change of seed and soil.

**FUNGUS IN CELLAR:** *H. R., Penzance.* This is a mere rudimentary state of some fungus. It may belong to the dry-rot, or one of numerous similar or dissimilar fungi.

**FUNGUS ON SEMPERVIVUM:** *F. D. S.* The name of the fungus on *Sempervivum* is *Endophyllum sempervivi*. Hitherto it has, I believe, kept to the House-leek, and has been rare. *W. G. S.*

**HEATING:** *F. S.* We do not see any objection to the arrangement you propose to adopt.

**INSECTS:** *E. A.* The insect found feeding at night on your *Odontoglossum citrosimum* is an immature speci-

men of a pretty green grasshopper (Conocephalus, sp.), from tropical America, which must have been imported in the egg state with the plant. I. O. W.—J. L. S. The grubs at the roots of your Lettuces and Strawberry plants are the larvae of the common Daddy Longlegs (Tipula oleracea). Set children to catch and kill the flies when they appear in numbers in your garden. The grubs are nearly full-grown, and will not do much more mischief. I. O. W.

MEALY-BUG ON GRAPES: York House. Very little can be done beyond removing the bug by means of a small brush and a solution of soft-soap. You might also try syringing hard with clean water, one person holding his hand behind the bunch, but in this case take care you do not scatter the insect with the spray.—L. H. J. The above is the best reply we can make to your enquiry. We do not recommend you to use insecticides now the fruit is swelling.

MIGNONETTE: P. D. E. Tree Mignonette, as it is called—that is, Mignonette plants grown on into tree-like shape—will go on blooming for a long period in a genial greenhouse temperature. Send the particulars of the case you refer to, and if of sufficient interest we will publish them.

MYOSOTIS: W. Divers. We have not met with a white variety of M. dissitiflora. The white form of M. sylvatica is plentiful.

NAMES OF PLANTS: F. B. 1, Cantua dependens; 2, Ruscus androgynus; 4 and 5, Chrysanthemums—send better specimens when in flower; 7, Amelanchier vulgaris; 8, Pulmonaria officinalis, var. alba; 9, P. officinalis; 10, Pyrus japonica. Please only send six another time, better specimens, and properly packed.—D. P. 1, Spiraea chamaedrifolia; 2, Tellima grandiflora; 3, Saxifraga hirta; 4, Pulmonaria virginica, one of the prettiest of herbaceous plants. Could you oblige us with a small plant?—J. T. B. Juniperus virginiana.—C. W. D. The Grecian Saxifraga Sibthorpii, Boissier.—W. P. Your plant is Chrysosplenium oppositifolium, not Saxifraga oppositifolia, which is rightly described as having purple flowers.—W. T. R. 1, The Paris Daisy—Chrysanthemum frutescens. The others are Mesembryanthemums, which we cannot name without the flowers.—J. G. M. Fritillaria nigra, alias pyrenaica.—R. Williams. Not recognisable from the leaves only.—G. W. G. Asplenium adiantum-nigrum.—John Smith. Agrostis alba, var. stolonifera.—W. Bishop. 13, Dendrobium Guiberti; 14, Maxillaria tenuifolia; 15, Dendrobium Devonianum; 16, Odontoglossum citrosium, white var.—S. M. & A. The pod of a Gleditsia, probably of G. triacanthus.—Inquirer, Haydock. 1, Dendrobium densiflorum; 2, Vanda savais; 3, Dendrobium Farmeri; 4, Passiflora Imperatrice Eugénie, a garden hybrid.—H. King. Gautheria shallon.—W. W. Morse. All three are but trifling varieties of Cypripedium pubescens, which varies much in colour.—James Vert. Chrysanthemum frutescens, var. A yellow seedling in the way of Etoile d'Or, but not so large.

PELARGONIUMS: R. Williams. The cause of the leaves turning yellow and falling off cannot be determined without more information than we possess. Probably the evil lies at the roots, which are either in a generally unhealthy state, or the soil has been over-dosed with manure.

POLYANTHUSES: W. Divers. A large-flowered and showy strain of ordinary border varieties, adapted for shrubbery and wilderness walks, but of no other merit.

RATING NURSERYMEN'S GREENHOUSES: R. M. Singshurst. See an article on the "Principles of Rating," in our number for September 1, 1877.

RHODODENDRON: G., Portsmouth. We are not able to name seedling varieties.

STRAWBERRY: E. P. We have failed to identify the variety; the berries were so much bruised when received.

THUYA, &c.: T. M., Ealing. The principal distinction between Thuya and Cupressus lies in the fact that in the latter genus there are several seeds to each of the fertile scales, while in Thuya there are 2—3, or rarely five seeds to each fertile scale. Retinospora is now made a section of Thuya. You will find the distinctions given in the present number, under the head of T. Standishii.

TUBEROSES: Novice. Pot the roots in a compost made up of equal parts of peat, loam, and manure; give one good watering, and plunge them in the hottest part of a stove. Withhold water from them until they begin to grow, and remove to a cooler house as they show for flower.

VINES: Lanark. Yours is a common enough case. Young Vines which are growing very freely are very liable to similar injury. It is due to what may be termed scalding—a sudden gleam of sunshine and rise of temperature whilst the young shoots, &c., are fully charged with moisture. Careful ventilation is the only preventive, but it is very difficult to avert at certain times.—A Constant Reader. We scarcely understand you, whether your Vines are in their first or second year's growth; but if the eyes of this year's growth are all breaking, as you state, it is due to your stopping them, and the excessively moist close atmosphere you are growing them in.—H. Clerk. We see nothing particularly the matter with the Vine leaf sent—certainly no Phylloxera. It is merely wanting in vigour.

VIOLET: W. H. Send some flowers and leaves packed in damp moss, and we will do our best to identify the

variety. A couple of withered blooms is hardly enough for this purpose.

\* \* \* Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see. Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

COMMUNICATIONS RECEIVED:—R. Johnson (many thanks).—J. A. F.—E. L. E.—G. H. W.—G. G.—C. W. D.—J. L. S.—E. P.—W. P.—W. K.—W. H.—H. K.—R. D.—W. P.—J. T. M.—J. F.—T. L.—Philanthos—C. & R.—W. H.—J. D.—S. L.—Dr. Bennet, Mentone.—F. S.—M. W.—G. P.—W. K.—J. A. H.—E. B.—D. P.—E. F.—Constant Reader.—H. P.—J. W.

Enquiries.

He that questioneth much shall learn much.—BACON. ASPHALTE.—I should be much obliged if any of your readers would give me the details of the best method of asphaltting garden paths, that will not become soft under the heat of the sun? G. G.

FOSTER'S WHITE SEEDLING GRAPE.—Has Foster's Seedling Grape ripened in the open air with any of your correspondents? If not, I claim credit as being the first one to ripen it—three years in succession, on a south wall—in 1876, 1877, and 1878, fine in bunch and berry. On the last date I cut them the first week in November, hung them up in the fruit-room, and some of them kept till January, 1879. Last year it did not come to perfection, the only Grape which ripened here in the open air being Royal Muscadine, or Chasselas de Fontainebleau. W. Divers, Wierton, Maidstone.

SCOTCH FIR TIMBER.—What time of the year is most suitable for cutting down plantations of Scotch Fir for timber? A. C. W.

YELLOW-BERRIED IVY.—Has the yellow-berried Ivy fruited in this country? We have some strong plants here about fifteen years old: I raised them from seeds brought here with other things from Rome. It blooms very freely but does not fruit. I think it is not quite so hardy as other sorts, but it has very beautiful foliage, of a fine glossy green, and is a strong growing variety. W. D., Maidstone.

Markets.

COVENT GARDEN, May 6.

Prices remain much the same, forced goods being with difficulty cleared. James Webber, Wholesale Apple Market.

Table with columns for Fruit (Apples, Lemons, Oranges, Pears, Pine-apples, Strawberries) and Vegetables (Asparagus, Lettuces, Mint, Mushrooms, Onions, Parsley, Peas, Potatoes, Radishes, Rhubarb, Seakale, Small salad, Spinach, Tomatoes, Turnips).

Table with columns for Plants in Pots (Arum Lilies, Azaleas, Bedding Plants, Begonias, Bouvardias, Calceolarias, Cinerarias, Cyclamens, Cyperus, Dracena terminalis, Erica, Euonymus, Ferns, Ficus elastica) and Foliage Plants (Fuchsias, Genista, Lilium, Lobelia, Mignonette, Myrtles, Pelargoniums, Rose, Spirea, Palmata).

Potatoes:—Regents, 100s. to 140s.; Flukes, 120s. to 160s.; and Champions, 170s. to 190s. per ton. German, 2s. 6d. to 7s. per bag; Channel Islands, 4d. to 6d. per lb.

PLANTS IN POTS.—WHOLESALE PRICES.

Table with columns for Plants in Pots (Arum Lilies, Azaleas, Bedding Plants, Begonias, Bouvardias, Calceolarias, Cinerarias, Cyclamens, Cyperus, Dracena terminalis, Erica, Euonymus, Ferns, Ficus elastica) and Foliage Plants (Fuchsias, Genista, Lilium, Lobelia, Mignonette, Myrtles, Pelargoniums, Rose, Spirea, Palmata).

CUT FLOWERS.—WHOLESALE PRICES.

Table with columns for Cut Flowers (Abutilon, Anemone, Arum Lilies, Azalea, Bouvardias, Camellias, Carnations, Cowslips, Daffodils, Eucharis, Euphorbia, Forget-me-not, Gardenias, Heliotropes, Hyacinths, Lily of the Valley, Mignonette, Narcissus) and other flowers (Pansies, Polyanthus, Pelargoniums, Primroses, Double white, Tuberoses, Roses, Spirea, Stephanotis, Tropaeolum, Tulips, Violets, English, Whiteflowers, White Lilac).

SEEDS.

LONDON; May 5.—The attendance of buyers on the market to-day was most meagre, and such business as took place was quite of a retail character. Small country orders for Alsike, white Trefoil, and other descriptions still come to hand, which are executed at the moderate rates current. As regards American Clover seed increased firmness is observable. This is owing to trustworthy reports received from Canada and also from the States, as to the poor prospects of next year's crop. Moreover, the stocks remaining in this country prove to be very light. The depressed quotations now ruling for Italian Rye-grass attract attention. There is a good sale for white Dutch Runner Beans; these are now extraordinarily cheap, whilst scarlets have suddenly become very scarce and much dearer. Hemp seed sells at 31s. per quarter. Sicilian Canary seed, of handsome quality, is now exceedingly cheap. The supply of good blue Peas is short. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

Trade at Mark Lane on Monday was quiet, and as regards Wheat prices were decidedly lower. English Wheat was in small supply, and a fall of 1s. per quarter, and occasionally more, was submitted to, to conclude sales. Foreign produce was from 1s. to 2s. per quarter cheaper on the week. Barley changed hands slowly at about late rates. Malt was quiet and unchanged. Oats were steady, the better sorts at rather higher prices. Maize was inactive, and rates were about 6d. per quarter lower than on Monday se'nnight. Beans and Peas were scarce, and prices firm. The flour trade was dull, and quotations favoured buyers.—On Wednesday trade was somewhat firmer. As regards Wheat quotations were more firmly supported. Barley showed no change in value. Malt remained dull; Oats were in moderate request, and sound corn was firm. Maize was slender, while as respects Beans, Peas, and flour rates were fully as high as on Monday.—Average prices of corn for the week ending May 1:—Wheat, 45s. 9d.; Barley, 33s. 6d.; Oats, 23s. 6d. For the corresponding period last year:—Wheat, 40s. 9d.; Barley, 30s. 1d.; Oats, 21s. 9d.

CATTLE.

At Copenhagen Fields on Monday prices for beasts on the average were higher than at the close of last week. For sheep prices are gradually advancing. Trade was not so brisk for lambs as of late, and our top quotation was only realised for choicest qualities. There was a large supply of calves, but choice qualities, being scarce, made high prices. Quotations:—Beasts, 4s. 6d. to 5s. 2d., and 5s. 6d. to 6s. 2d.; calves, 5s. 6d. to 6s. 6d.; sheep, 5s. 3d. to 6s., and 6s. 6d. to 7s. 4d.; lambs, 8s. to 9s. 4d.; pigs, 4s. 6d. to 5s. 4d.—On Thursday trade was quiet. Beasts were in short supply, but sufficient for the demand, which ruled inactive, at barely noted rates. Sheep and lambs were dull and weak, especially the latter. Calves sold at previous quotations.

HAY.

The Whitechapel Market report for Tuesday states that with a large supply trade was dull, and prices were not very well supported. Quotations:—Prime Clover, 100s. to 132s.; inferior, 80s. to 95s.; prime meadow hay, 80s. to 102s. 6d.; inferior, 30s. to 70s.; and straw, 30s. to 38s. per load.—On Thursday there was a fair supply of hay and straw on offer. The trade was dull at the above rates.—Cumberland Market quotations:—Superior meadow hay, 97s. to 105s.; inferior, 45s. to 75s.; superior Clover, 126s. to 132s.; inferior, 75s. to 100s.; and straw, 36s. to 40s. per load.

POTATOS.

The Borough and Spitalfields Markets reports state that the supplies have been good. The demand remains slow. Quotations:—Scotch Regents, 140s. per ton; Champions, 150s. to 160s.; Lincoln ditto, 140s. to 160s.; Victorias, 150s.; German reds, 5s. to 7s. per bag; Belgian kidneys, 5s. 3d.; French whites, 4s. 3d.; Dutch whites, 4s.—The imports into London last week comprised 51,862 bags from Hamburg, 15,773 bags Stettin, 4043 bags Danzig, and smaller consignments from various other ports.

Government Stock.—The closing price of Consols on Monday were, for delivery, 99 1/4 to 99 3/4, and for the account, 99 1/4 to 99 3/4. The final quotations on Tuesday, Wednesday, and Thursday, were, for delivery, 99 1/4 to 99 3/4, and 99 1/4 to 99 3/4 for the account.

W. G. SMITH & CO.,  VICTORIA WORKS,  
BURY ST. EDMUNDS,

SOLE MANUFACTURERS OF

BEARD'S PATENT METALLIC NON-CONDUCTING GLASSHOUSES.

Iron Houses possess many valuable advantages over Wood. They are much more Durable, Lighter and Stronger. The Glass is screwed in between two layers of Elastic Material, whereby a perfect joint is secured without risk of breakage.

Catalogues and Price Lists Free.

HEATING APPARATUS IN ALL ITS BRANCHES.

Plant Protectors, Cucumber and Melon Frames always in Stock.

HORTICULTURAL BUILDINGS OF EVERY DESCRIPTION IN IRON OR WOOD.

RANSOMES' LAWN MOWERS ARE THE BEST.

ARE SUITABLE FOR ALL GARDENS.

WILL CUT LONG GRASS, WET OR DRY.

All Sizes from 27s.

A MONTH'S FREE TRIAL ALLOWED.

Sent Carriage Paid.

THE "AUTOMATON."

The best general purpose machine.

MAKENZIE AND MONCUR,

Horticultural Builders and Heating Engineers,

UPPER GROVE PLACE, EDINBURGH, AND 43, ST. ANDREW'S CROSS, GLASGOW.

MAKENZIE & MONCUR, from long practical experience in Horticultural Building in all its branches, and having extensive Works, with the newest and most approved Steam-power Machinery, are in a position to execute all orders entrusted to them with efficiency and despatch, on the most moderate terms. They use nothing but the very best materials in Iron, Timber, Glass, Paints, &c., and have always a large staff of sober, experienced workmen in the various departments.

Hothouses of every description contracted for in any part of the United Kingdom.

M. & M. have made Heating with Hot Water a special study, and are prepared to contract for Apparatus either on the ordinary low-pressure principle with Cast-iron Pipes and Malleable-iron Boilers, or on the high-pressure principle with Malleable Tubes and Fire Coils, and will guarantee satisfactory results in all cases.

Splendid ILLUSTRATED CATALOGUES, with more than Eighty Designs, 3s. 6d. in Postage Stamps.

Special Plans and Specifications supplied on receipt of particulars, and Gentlemen waited upon when required.

THE PLANS of GARDENERS and ARCHITECTS CARRIED OUT.

"ARCHIMEDEAN" AMERICAN LAWN MOWERS,

Will Cut Long and Wet Grass (as well as Dry and Short) without Clogging.

They are especially adapted for Cutting Slopes, Steep Embankments, under Shrubs, and close up to Trees, &c.; and are also extremely light in draught, simple in construction, well made, and not likely to get out of order.

PATTERNS ARE THE BEST.

London Agents: **HILL & SMITH, Queen Victoria Street**  
**T. BRADFORD AND CO., Holborn**  
(and all respectable Ironmongers in Town or Country).  
MANUFACTORY: **BANBURY, OXON.**

Oil Paint No Longer Necessary.  
**HILL AND SMITH'S BLACK VARNISH,**  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all  
outdoor work, while it is fully two-thirds cheaper. It was intro-  
duced upwards of thirty years ago by the advertisers, and its  
genuine good quality, notwithstanding a host of unprincipled  
imitators, is fully attested by its constantly increasing sale.  
It may be applied by an ordinary labourer, requires no mixing or  
thinning, and is used cold. It is used in the grounds at Windsor  
Castle, New Gardens, and at the seats of many hundreds  
of the Nobility and Gentry, from whom the most flattering  
testimonials have been received.

Sold in casks of about 30 gallons each, at 15. 6d. per gallon  
at the Manufactory, or 15. 8d. per gallon carriage paid to any  
Station in the Kingdom.

UNSOLICITED TESTIMONIAL.  
"Pierrefield Park, June 21, 1875.—Sirs,—I have this day  
forwarded from Chepstow to your address a black varnish cask,  
to be filled and returned with as good Varnish as the last we  
had, which I candidly admit was the best we ever had. Address  
Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours  
respectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their  
Customers against the various cheap Varnishes now so much  
advertised.

H & S's Varnish has been an article of common use on most  
of the large estates in the Kingdom for upwards of thirty years;  
and their constantly increasing trade in it, and the numerous  
Testimonials they receive, stamp it as a truly genuine article.  
Every cask is legibly marked with their name and Registered  
Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE of Fencing, Hurdles, Field  
and Entrance Gates, &c., sent free on application to  
**HILL AND SMITH, Brierley Hill Ironworks, Staffordshire;**  
118, Queen Victoria Street, London, E.C.; and 180, Buchanan  
Street, Glasgow.

**Hurry's Daisy and Weed Extractor,**  
FOR LAWNS.

No one possessing a Lawn should be without this wonderfully  
useful little Invention.

(See the Gardeners' Chronicle of August 2, 1879.)

**Directions for Use:—**  
The "Extractor" should be used as early in the year as  
possible, in the following manner:—Place the tool over crown  
of weed, and with a slight twist extract it. The plugs so raised  
discharge themselves (second pushing out first), and should be  
replaced UPSIDE DOWN while still fresh. The weed will die,  
and the grass grow better where this has been done. In using  
mowing machine after "Extractor" the box should be left  
off as much as possible, and the grass afterwards well rolled.  
If these instructions are carried out any lawn may be effectually  
freed from the obnoxious Plantain and Daisy roots which so  
often offend the eye. Lawn grass should always be kept short, to  
avoid the weed seeding.

To be obtained of all Ironmongers and Florists. Price 3s. 9d.  
only. In Polished Wood, fancy handle, 4s. 6d.

## HELLIWELL'S PATENT SYSTEM of IMPERISHABLE GLAZING WITHOUT PUTTY, INDIARUBBER, or CEMENT.

It is adopted by H.R.H. the Prince of Wales.

Highest Award at Fine Art Exhibition, York.

No outside painting required, and it is easily repaired by even inexperienced workmen.

"Bank Chambers, Norwich, October 24, 1879.

"T. W. Helliwell, Esq., Brighouse.—Sir,—I went yesterday and examined the Glass Roof Glazed by you, under my directions, at Sandringham, for His Royal Highness the Prince of Wales, and found it perfectly satisfactory in all respects. The appearance is vastly superior to the old system of wood and putty, and I shall be glad to recommend it whenever I can.—Believe me, yours faithfully.

"C. SMEDLEY BECK, Architect."

T. W. HELLIWELL, Brighouse, Yorkshire, and 19, Parliament Street, LONDON, W.C.

**KINAHAN'S LL WHISKY.**  
Pure, Mild and Mellow, Delicious and Most Wholesome. Universally recommended by the Profession. The Cream of Old Irish Whiskies.  
**KINAHAN'S LL WHISKY.**  
Dr. Hassall says—"Soft and Mellow, Pure, well Matured, and of very excellent quality."  
**KINAHAN'S LL WHISKY.**  
Gold Medal, Paris Exhibition, 1878; Dublin Exhibition, 1865, the Gold Medal.—20, Great Titchfield Street, London, W.

"By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—*Civil Service Gazette*.

**EPPS'S COCOA.**  
**GRATEFUL AND COMFORTING.**  
**JAMES EPPS AND CO., HOMOEOPATHIC CHEMISTS.**

**"OLD DR. JACOB TOWNSEND'S" SARSAPARILLA. THE BLOOD PURIFIER.**

This extraordinary Medicine has a singular influence upon the blood, which it enriches and purifies. It removes all pimples and blotches, purifies the system, and acts like a charm. As a sustaining and purifying tonic it is invaluable, and highly recommended in long-standing cases of indigestion, nervousness, coughs, colds, scrofula, gout, dropsy, and wasting of flesh. Sold by all druggists. Caution.—Get the red and blue wrapper, with the Doctor's head in the centre. No other genuine. In bottles, 2s 6d., 4s 6d., and 11s.—131, Fleet Street, E.C.

**DINNEFORD'S MAGNESIA.**  
The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for  
**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, AND INDIGESTION,**  
and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**

**HOLLOWAY'S OINTMENT and PILLS.**  
—**COUGHS, INFLUENZA.**—The soothing properties of these medicaments render them well worthy of trial in all diseases of the lungs. In common colds and influenza the Pills taken internally and the Ointment rubbed externally are exceedingly efficacious. When influenza is epidemic this treatment is easiest, safest, and surest. Holloway's Pills and Ointment purify the blood, remove all obstructions to its free circulation through the lungs, relieve the overworked air tubes, and render respiration free without reducing the strength, irritating the nerves, or depressing the spirits. Such are the ready means of saving suffering when afflicted with colds, coughs, bronchitis, and other complaints by which so many are seriously and permanently afflicted in most countries.

**Consumption and Asthma**  
in all stages are instantly relieved by  
**DR. LOCOCK'S PULMONIC WAFERS,**  
which taste pleasantly, and effect a rapid cure. In Bronchitis, Coughs, Colds, Whooping Cough, Phlegm, and all Disorders of the Breath, Throat and Lungs, Hysterical, Nervous and Heart Complaints, Rheumatism and Nervous Pains, "they act like a charm." Price 1s 1/2d., 2s 9d., 4s 6d., and 11s. per Box, of all Druggists.

# GREEN'S PATENT "SILENS MESSOR" & "MONARCH"

NOISELESS LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1880.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on many occasions, H.R.H. the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Upwards of 95,000 of these Machines have been Sold since they were first introduced in the year 1856, And Hundreds of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are the advantages over all others :—

- 1st. Simplicity of Construction—every part being easily accessible. 2d. They are worked with much greater ease than any other. 3d. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either long or short Grass, wet or dry.

## Single-handed Lawn Mower.

By a Man and Boy.	
*To cut 22 inches. By Two Men ...	8 10 0
* If made stronger, suitable for Donkey, 30s. extra.	
*To cut 24 inches. By Two Men ...	9 0 0
* If made stronger, suitable for Donkey, 30s. extra.	

Prices of Donkey, Pony, and Horse Machines, including Patent Self or Side Delivery Box, Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness :—

### DONKEY and PONY MACHINES.

To cut 26 inches ... ..	£14 0 0
To cut 28 inches ... ..	16 0 0
To cut 30 inches ... ..	18 0 0
Leather Boots for Donkey ... ..	1 0 0
Leather Boots for Pony ... ..	1 4 0

### HORSE MACHINES.

To cut 30 inches ... ..	£22 0 0
To cut 36 inches ... ..	26 0 0
To cut 42 inches ... ..	30 0 0
To cut 48 inches ... ..	34 0 0
Leather Boots for Horse ... ..	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the Machine.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select out of several hundred Machines, of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, free of cost to the Purchaser.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

## GREEN'S PATENT ROLLERS

For Lawns, Drives, Bowling Greens, Cricket Fields and Gravel Paths.

SUITABLE FOR HAND OR HORSE POWER.

These Rollers are made in two parts, and are free in revolving on the axis, which affords greater facility for turning. The outer edges are rounded off, or turned inwards, so that the unsightly marks left by other Rollers are avoided.

## SALES BY AUCTION.

## Specimen Stove and Greenhouse Plants, &amp;c.

**MR. J. C. STEVENS** will SELL by AUCTION, at his Great Rooms, 58, King Street, Covent Garden, W.C., on WEDNESDAY, May 13, at half-past 12 o'clock precisely, a fine collection of Specimen STOVE and GREENHOUSE PLANTS, including many fine varieties of Ferns, Palms, Anthuriums, Marants, &c., many of them having taken Prizes at the various Horticultural Shows in Kent; also a collection of ESTABLISHED ORCHIDS, many of them in flower, including fine specimens of *Odontoglossum vexillarium*, *O. Andersonianum*, *O. triumphans*, *O. gloriosum*, *Dendrobium*, &c.

May be viewed the morning of Sale, and Catalogues had.

## Cattleya Mossiae and its varieties.

**MR. J. C. STEVENS** will SELL by AUCTION, at his Great Rooms, 58, King Street, Covent Garden, W.C., on WEDNESDAY, May 13, at half-past 12 o'clock precisely, a large importation of *CATTELEYA MOSSIAE* and its varieties, just arrived from South America in good condition, many of them in fine masses that would make good exhibition plants; the leaves are as fresh on most of these Cattleyas as if they had only travelled a few miles. *C. Mossiae*, being one of the most beautiful of Cattleyas and so easily grown, is especially worthy of notice.

May be viewed the morning of Sale, and Catalogues had.

## The Collection of Established Orchids formed by the late J. B. Cockerell, Esq., of Cheshunt.

**MR. J. C. STEVENS** has received instructions from the Executrix to offer for SALE by AUCTION, without the least reserve, on THURSDAY and FRIDAY, May 20 and 21, at half-past 12 o'clock precisely each day, the entire COLLECTION of COOL and other ORCHIDS, formed by the late J. B. Cockerell, Esq., comprising beautiful specimen plants of *Odontoglossum Alexandrie*, triumphans, vexillarium, Andersoni, &c.; *Masdevallia Veitchii*, Harryana, Lindeni, agnes, all nice healthy plants; *Cattleya Mendellii*, *Labata*, *lobata*, *Trianae*, *Mossiae*, &c.; *Dendrobium Warianum*, crassum, noble, and other good varieties; *Oncidium*, *Calanthes*, *Epidendrum*, &c.

May be viewed the mornings of Sale, and Catalogues had.

## Phalenopsis grandiflora on blocks, received direct from Borneo.

**MR. J. C. STEVENS** will SELL by AUCTION, at his Great Rooms, 58, King Street, Covent Garden, W.C., on FRIDAY, May 21, at half-past 12 o'clock precisely, a magnificent consignment of *PHALENOPSIS GRANDIFLORA*, received in a first-rate semi-established condition. Also *CYPRIPEDEUM NIVEUM*, *ANACROCHILUS DAWSONI*, a new *VANDA*, &c.

May be viewed the morning of Sale, and Catalogues had.

## Importations from Ceylon of Dendrobium McCARTHEE, &amp;c.

## CATALOGUES post-free.

WM. CLIBRAN and SON, Oldfield Nursery, Altrincham.

## HELLEBORUS NIGER,

the Christmas Rose. This beautiful white flower, coming to perfection at Christmas time, is already much too little grown, being hitherto too scarce and dear. Millions of its fine blossoms should be ready for the markets in mid-winter, where only hundreds are now to be found, and would always prove the most profitable thing it is possible to grow. It requires no heat nor care. We are prepared to supply for immediate orders any quantity of fine roots at one-sixth the usual prices, and we believe that investment in them will prove the finest speculation possible. For terms apply to

HOOPER and CO., Covent Garden, London, W.C.

To Nurserymen, Seedsmen, and Florists.

Copy from London Gazette, Feb. 27, 1880.

NOTICE IS HEREBY GIVEN that the PARTNERSHIP heretofore subsisting between Joseph Rains, Marcus Rains, and Morris Isaacs, carrying on business as Dealers in Dutch Flower Roots and Bulbs, at 62, Tenter Street South, Goodman's Fields, Whitechapel, in the County of Middlesex, under the style or firm of M. ISAACS, RAINS and CO., was DISSOLVED, by an order of the Chancery Division of Her Majesty's High Court of Justice, on November 27, 1879, as from that date.

MR. MORRIS ISAACS, for fourteen years the Senior Partner in the above late Firm, will for the future carry on the Business of IMPORTER of DUTCH FLOWER ROOTS, in PARTNERSHIP with his Son, Mr. LEWIS ISAACS, at their New Warehouse, 3, Victoria Warehouses, Mansell Street, Goodman's Fields, London, E.C.

Bennett's Pedigree Roses

The above are all first-class varieties and true to name, for cash with order to

CHARLES HURLEY, Brentwood.

New Japanese Azalea.

AZALEA ROSEFLORA.-This beautiful species, which is now offered for the first time, differs from every other Azalea in cultivation. The flowers in the bud resemble those of a miniature Tea Rose, whilst as they expand they regularly imbricate like those of a Camellia. These qualities, combined with the fact that it does not fall off, render it invaluable for coat flowers, bouquets, as well as for exhibition and general decorative purposes. It is compact and free in growth, and much branched; colour deep-rose-red.

First size, 6 inches high, some in flower, 10s. 6d.
Second size, 6 to 9 inches high, some in flower, 21s.
Third size, 1 foot high, many in flower, 21s. 6d.
WM. HUGH GOWER (Manager to the late Wm. Rollisson & Son), The Nurseries, Tooting, S.W.

Primulas - Primulas - Primulas.

Also strong healthy CUTTINGS of the above at half-price, free by post.

S. BIDE, Alma Nursery, Farnham, Surrey.

Uninjured by Frost.

EVERGREENS.-In splendid condition for safe removal; having been regularly transplanted and growing in a very exposed situation, are very hardy and robust, thus having withstood the past excessively severe winter without injury.

With reference to the hardy nature of the Trees and Plants reared in these Nurseries, a customer in Yorkshire writes:- "I am very well satisfied with the Roses you sent-the frost has not hurt them, whilst a lot I got from the South have suffered very much."

CATALOGUES on application.

THE QUEEN'S SEEDSMEN, READING.

MATRICARIA INODORA PLENA

(NEW DOUBLE MAY-WEED).

Figured in Gardeners' Chronicle of December 13, 1879. Will bear the severest winter without protection. If grown in a rich border it will flower in the greatest profusion from June till October, and the flowers, which are pure white, are equal to those of a Pompon Chrysanthemum. It is invaluable for cutting. 1s. 6d. each, 12s. per dozen, 75s. per 100. Engraving sent with three plants. The usual discount to the Trade.-Messrs. DICKSONS AND CO., 1, Waterloo Place, Edinburgh.

MEXICAN ORCHIDS, PALMS, TREE

FERNS, &c.-The undersigned has for several years past collected Orchids, Arboreous Ferns, &c., for some of the largest European and United States Nurseries. He is prepared to furnish price LISTS upon application by mail. The best season for collecting Orchids is now at hand, and will terminate with the month of May. Large orders can be filled at very low rates for cash in advance, or upon satisfactory references -HUGO FINCK, Cordoba, Mexico

Cheap

Orchids.

B. S. WILLIAMS having recently received from his Collectors and Correspondents in different parts of the world large consignments of ORCHIDS, and through having purchased several Collections in this country, is now in a position to offer good young healthy Plants at more reasonable prices than it has been possible hitherto to sell at. An inspection is respectfully invited. Special LIST of cheap and desirable kinds sent post-free on application. Victoria and Paradise Nurseries, Upper Holloway, London, N.

Are beyond all question the finest ever sent out. The Set, in strong plants, 4s. 6d.

NEW BEDDING PLANTS.

It is most remarkable that the two best and most valuable new Bedding Plants of the last season should have almost escaped notice—Lobelia Blue Beard totally setting aside all others, and the same with Tropaeolum Vesuvianum.

Phloxes, Violas, and Cannas.

H. CANNELL has a large stock of the above, and of all the best varieties, and can supply them in large or small quantities.

Zonal Pelargoniums.

IT must be admitted that a Bedding and winter-blooming Zonal superior to Master Christine is a gift to Floriculture, and it is therefore with great pleasure I now offer NEWLANDS MARY, which is certainly by far the best bedding Pink in cultivation.

Bedding Plants, &c.—Notice.

WOOD and INGRAM beg to offer their very fine stock of Variegated, Zonal, and other Geraniums, Verbenas, Centaureas, Hollyhocks, Alternantheras, Calceolarias, Iresines, Lobelias, and all varieties of the most useful BEDDING PLANTS.

NOTICE.

Remarkable Success for Many Years.

AMIES' MANURE IS THE CHEAPEST AND BEST FOR ALL HORTICULTURAL PURPOSES.

Amies' Anti-fungoid Potato Manure Is a great Preventive of the Potato Disease.

For prices and particulars Write for our NEW PAMPHLET, post-free.

AMIES' CHEMICAL MANURE COMPANY, LIMITED, 79, MARK LANE, LONDON, E.C.

TO SECURE BEAUTIFUL FLOWERS!! WATER YOUR PLANTS WITH FLORVITA. Samples, post-paid, 1s. 2d. Prepared only by PRENTICE BROS., Stowmarket. Sold by all Chemists and Florists in Bottles, 1s. and 2s. 6d. each, And in Jars, 18s. and 36s. each.

An Important Discovery. SOLUBLE FIR TREE OIL INSECTICIDE.—The cheapest and best of all insecticides for small and large nurseries, plantations, &c. Once tried always used. Full directions with each Bottle, price 1s. 6d., 2s. 6d., and 12s. 6d. each. Special quotations for large quantities. London Agents: HOOPER AND SONS, Covent Garden, and from all Seedsmen. Manufactured by E. GRIFFITHS HUGHES, Operative Chemist, Victoria Street, Manchester.

Tobacco Fibre Insecticide. All who have a Greenhouse and love to see their Plants look clean and healthy should use

DARLINGTON BROTHERS' TOBACCO FIBRE.—Contains more Nicotine than any other Insecticide sold; purer and better than the best Tobacco Paper or Cloth; easy to use; no apparatus requisite; a common garden pot only required; will not flare, is perfectly safe, and is the best article for making Nicotine Juice for syringing purposes. Forty per Cent. saved by the use of this article. Prices, 6lb., 5s.; 25lb., 21s. First-class ROLL TOBACCO PAPER or CLOTH, same price as above. Best Paper and Cloth made. Vide Testimonials, free on application. Post-office Orders, Darlington Brothers, Chatham. Cheques crossed London and Provincial Bank. DARLINGTON BROTHERS, Frederick Street, Chatham.

**SPLENDID NEW COLEUS—"GEORGE SIMPSON."**

**MESSRS. JAMES VEITCH & SONS**

Are now booking orders for the above, undoubtedly the finest and most distinct COLEUS in cultivation.

The coloration of the foliage is varied and striking. The younger leaves are rosy-crimson, suffused with scarlet and edged with golden-yellow. In the older leaves the crimson is deeper and shaded with blackish-maroon, and the gold edging is changed to a bright green.

It was unanimously awarded a First-class Certificate, on April 27, by the Floral Committee of the Royal Horticultural Society, and pronounced to be the most brilliant and highly coloured of all Coleuses.

"A splendid variety, with all the colours bright and effective, and well brought out for contrast. It is in every way A 1."—*Gardeners' Chronicle*.

"A handsome and distinct variety."—*The Garden*.

"Very distinct and attractive."—*Journal of Horticulture*.

Plants ready for distribution June 1, price 5s. each.

**ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, S.W.**

**SELECT INDEX OF PLANTS**

The Publisher of the *Gardeners' Chronicle* recommends Subscribers who wish to have extra Copies of the Numbers containing the

**SELECT INDEX of PLANTS from 1841 to THE END of 1878, TO SECURE THEM AT ONCE.**

*The following is a List of those already published:—*

1879.—October 11	1879.—November 29	1880.—February 7, 21
November 25	December 13	March 20, 27
November 8	1880.—January 10	April 3
November 15	January 24	May 8

Price 5d. each, post-free 5½d.

**W. RICHARDS, 41, WELLINGTON STREET, STRAND, W.C.**

**CHOICE PELARGONIUMS FOR SPRING, 1880.**

**PELARGONIUM VOLUNTE NATIONAL.**

I have great pleasure in recommending this beautiful decorative Pelargonium, as being one of the most distinct, free flowering, and best habited plants ever sent out. As a Decorative Plant, or for Cut Flowers, it is invaluable.

Awarded a First-class Certificate by Royal Horticultural Society, July 8, 1879.

Price, 3s. 6d. each, Strong Flowering Plants.  
 ,, 2s. 6d. each, Small Plants—Free by Post.

*Coloured Plates free to Customers when one dozen and upwards are ordered.*

**Pelargonium Lucie Lemoine. Pelargonium Madame Charles Konig.**

Both of these varieties are pure white, of great substance, free and continuous bloomers.

Will be very valuable for Cut Flowers.  
 2s. 6d. each.

**SEMI-DOUBLE-FLOWERED PELARGONIUMS.**

**ALBA PERFECTA.**—Pure white flowers, very dwarf and free flowering. Will prove one of the very best white bedders, as the flowers have no shade of pink in them.

**EMILE DE GERARDIN.**—Soft bright rose-pink, very dwarf and free flowering.

**LA NUBIEN.**—Deep fiery crimson, very free flowering.

The above three semi-doubles are very distinct, and quite new in colour, and will be invaluable to cut from—in fact, would make a lovely bouquet by themselves.

Plants 2s. 6d. each. Usual Trade Price.

ONE PLANT of EACH, PACKAGE or POST-FREE, for 12s. 6d.

# SPECIMEN ORCHIDS AND OTHER PLANTS.

## MR. ANDERSON

Having recently purchased a quantity of SPECIMEN ORCHIDS from several Collections has them now on view at Meadowbank, where he will be happy to show to intending Purchasers.

There is also a quantity to offer of *Established Plants of the Best Varieties of Species*, comprising VANDAS, AERIDES, SACCOLABIUMS, CATTLEYS, LÆLIAS, DENDROBIUMS, ODONTOGLOSSUMS, ONCIDIUMS, MASDEVALLIAS, &c., the principal of which are described in CATALOGUES about to be issued, and which will be sent to Applicants.

There is also a house, 80 feet by 24 feet, filled with SPECIMENS of TREE FERNS, PALMS, CYCADS, GLEICHENIAS, AZALEAS, in newest and best sorts, HEATHS, CAMELLIAS, &c., which Mr. Anderson is anxious to dispose of, requiring the room for other purposes, and will be glad to furnish tenders at cheap rates.

The collection of AMARYLLIS and NERINES at Meadowbank is very superb indeed, increasing in importance every year. The variety of HIPPEASTRUM, from deep crimson all through the intermediate shades to nearly pure white, is something wonderful, and is not equalled by any other family in the whole dominion of Flora. The NERINES, as a class, are unequalled for brilliancy of colour, and the newer hybrids, such as Meadowbankii, have a softness and finish about the umbelliferous heads of flowers that is really captivating.

BOTANICAL GARDENS.\*

FROM the beginning Botany has always been a thoroughly practical science. It is my object to-night to show to you that it is as true to its traditions to-day as it was three centuries ago. All that we ask as scientific men is free scope for using the organisation which is a necessity of any intelligent attempt to turn the resources of the vegetable kingdom to account, for purely scientific as well as for useful and commercial ends. Our aim is to make this organisation do a double duty, and I hope that I shall succeed in satisfying you, whether as administrators or as merely practical men, that in botanical pursuits such a combination of interests, while it adds enormously to the scope of scientific activity, is also of the greatest service to the community from a merely material point of view.

As my object in this paper is not so much to give a history of the work which Kew has done as to describe the position which it occupies in an extensive system, I shall not occupy your attention with an enumeration of the successes which Kew has met with in plant distribution in various parts of the world. I may, however, say that besides the regular routine system, occasionally larger operations are undertaken in connection with plants of special importance. I must not pass over without notice in this connection what has been done in such matters as Cinchona, Caoutchouc, Liberian Coffee, &c. With regard to the first, I may quote a paragraph from Sir William Hooker's report for the year 1861:—"Upon the Royal gardens devolved the duties of receiving and transmitting the seeds and plants to India, of raising a large crop of seedlings, of nursing the young stock, lest those sent on should perish or the seeds lose their vitality, and of recommending competent gardeners to take charge of the living plants from their native forests to the hill country of India, and to have the care of the new plantations there. Further, with the sanction of the Indian and Colonial Governments, it was arranged that our West Indian Colonies and Ceylon should be supplied with a portion of the seeds. Of the success of Cinchona in India and Ceylon it is not necessary to speak. In Jamaica the sales of bark from the Government plantations will this year reach £5000, and some of the consignments have fetched the highest price in the London market. In Trinidad, on the other hand, where the enterprise at first promised well, nothing seems to have come of it; while in St. Helena, which by this time Cinchona

\* The extracts above given are taken from a very comprehensive address delivered by Mr. W. T. Thiselton Dyer before the Royal Colonial Institute on the 11th inst. The main purport of the lecture was to make more generally known the scope and object of what was termed "The Botanical Enterprise of the Empire." To this end a general review of the work done at Kew, as the central establishment, of which the Colonial gardens are, as it were, the branches, was given. At the risk of breaking the continuity of the history, we have been obliged to omit much relating to Kew for the sake of inserting the much less well known details relating to the several Indian and Colonial gardens.

planting might have restored to prosperity, the Cinchona plants sent out from Kew have merely grown into trees, unscen and uncared for, and choked with vegetation. They have obstinately persisted in living, notwithstanding the determined protestations to the contrary of the colonists, who prefer to occupy themselves with New Zealand Flax. While India owes of course to its own Government the initiation and the payment of the cost of the measures taken at Kew for the introduction of Cinchona into that country, it is entirely to Kew that must be given the credit of early and successfully introducing it into Ceylon and Jamaica.

An essential feature in any botanical establishment such as Kew is a herbarium and library. The object of the former deserves a few words of explanation. It is of course obvious that in dealing for industrial purposes with any particular kind of plant or any useful vegetable production, it is very important that there should be no ambiguity about its identity. This seems such a truism as to be hardly worth mentioning. But as an actual fact it is far easier to fall into error in the matter than might be supposed. The commencement of the great Tea industry of India actually hung for some years in suspense in consequence of a fierce controversy as to whether the indigenous Tea plant of Assam was or was not identical with that of China. And it is well known that the Dutch introduced at great cost into Java a worthless species of Cinchona (*C. Pahudiana*), the cultivation of which they had eventually to abandon.

It is, therefore, of great consequence to have some central standard of reference, by means of which doubtful points can be cleared up. It might be supposed that this could be done by consulting books, and if our knowledge of the earth's vegetation were more complete than it is, a great deal could be done in this way. But in practice at the present time this is not always possible. As I have remarked on another occasion, "It is not always easy in foreign countries for even botanists to correctly name their plants, and it requires the resources of a central establishment, such as we possess in Kew, to accomplish this with any certainty, more especially if the material to work upon is, as is too often the case, fragmentary."

#### COLONIAL BOTANIC GARDENS.

I shall now ask your attention to a very rapid sketch of the principal external seats of the botanical work of the empire. The first and foremost of these is, of course, India; and even a paper wholly devoted to this part of my subject would do it but the scantiest justice. I must mention, in the first place, the Forest Department, and which is a model of thorough and efficient organisation, well adapted to the purely business aspects of forest administration, and at the same time, under its present distinguished head, thoroughly scientific in character. Some of our most accomplished Indian botanists have worked in its ranks. Cleghorn, Dalzell, Kurz, Stewart, Peddome, Mann, and Gamble, are names of which the botanical service of any country might be proud.

#### CALCUTTA.

The Calcutta Botanic Garden, which should be the headquarters of botany in India, has somewhat lost ground in becoming little more than the botanical department of the Bengal Presidency, and the superintendent is pretty well overwhelmed with purely local duties, including taking part in Calcutta medical education, managing the Sikkim Cinchona plantations, and even selling as well as fabricating the Government febrifuge. I do not mean it to be inferred that I depreciate or think lightly of any part of these most important duties; but they absorb the attention of Dr. King, to the complete exclusion of any time or indeed official scope for those larger functions of botanical adviser to the Government of India, of the need of which we are continually sensible at Kew. At Calcutta are deposited the chief herbarium and botanical library for the whole of India; I believe at this present time there is no subordinate European

officer in charge of either. This should be the seat, however, of a botanical intelligence department, where an officer possessed of business capacity and scientific qualifications, and with proper assistants, should study the botanical capacities and needs of different parts of India, and lay down a policy by which they might be developed and supplied.

#### SAHARUNPORE.

At present, besides the Calcutta Botanic Garden, there are two other important establishments, as well as minor ones, with which Kew corresponds. On the North-west Provinces, the important garden at Saharunpore, with its dependencies, is under the superintendence of an able botanist, Mr. Duthie, who was selected by the authorities of Kew for the post. And to show you what important functions such an institution can perform, I will quote from the review by Mr. Buck, the Director of Agriculture and Commerce, of the condition of the garden on the retirement of Dr. Jameson, Mr. Duthie's predecessor:—"Through his position in charge of the gardens, Dr. Jameson was enabled to develop what has proved to be the most successful and remunerative enterprise which has been carried out in India under the British Government, viz., the cultivation of Tea. The wealth acquired by India, through Dr. Jameson's efforts in the development of the Tea industry, has repaid Government over and over again for any outlay which has been expended on these botanical gardens." This splendid achievement, which I think will be only paralleled by the success which will accrue to the Sikkim Cinchona enterprise, associated with the Calcutta Botanic Garden and with which the name of Dr. King will doubtless be similarly connected, did not prevent Dr. Jameson's developing the usefulness of the Saharunpore Garden in other directions. He founded and maintained a museum, "one of the finest rooms to be met with in Upper India," and with contents the excellence of which is not unworthy of it, and which have supplied the materials for several useful publications. He also accumulated an important herbarium, which his successor has done much to reduce to working order. It is to be hoped that this herbarium will be limited as far as possible to the representation of the local flora of North-west India, and will not be allowed to compete with the Calcutta herbarium, which should always be the chief establishment of the sort in India.

Almost any kind of fruit trees can be raised at the Saharunpore gardens, and there are to be seen three "rows of Plum trees bearing magnificent crops of fruit, though they had received but little special treatment." Kew has for years past regularly corresponded with them. When possessing but four *Ipecacuanha* plants it gave two of them to Dr. Jameson, who successfully accomplished the difficult feat of conveying them from Kew to Saharunpore.

#### THE AGRICULTURAL SOCIETIES, ETC.

The garden of the Agri-Horticultural Society at Madras, though only partially subsidised by Government, accomplishes much excellent work, and maintains an active correspondence with Kew, to which its monthly publications afford much extremely valuable information. This garden is "the only place of its kind on the plains of Southern India."

The Agri-Horticultural Society of India, the seat of which is at Calcutta, also publishes excellent papers and notices, but in so far as these are of a scientific kind, they appear to me to somewhat compete with the functions of the Calcutta Botanic Garden, and with what should be the Indian Botanical Department. Besides these there are numerous other similar bodies scattered throughout India, as well as gardens and model farms, at all of which some amount of botanical work is prosecuted. Time would not permit of my attempting a general view of the combined operations of all these, even if I had the materials for the purpose. The Forest Department is also organising a system of forest gardens, which doubtless, especially in the more outlying territories of India, will be of great usefulness. But what, I must repeat, is particularly apparent, especially from the correspondence which reaches us at Kew, is the want of co-ordination between the different fragments of a great machine, and the absolute ignorance of the plants that have been introduced and the work that is being done in different parts of India amongst the official residents there. This may be a necessary incident of a decentralised system of government, but from the point of view of scientific and economic enterprise, it involves a conspicuous waste of energy and resources.

(To be continued.)

## New Garden Plants.

### *ERIA MERGUENSIS*, Lindl.

Once more a scarcely known old Orchid appears in England through Mr. Low's enterprising zeal. It is no grand thing, but is a lovely little gem, collected hitherto only by Griffith, Lobb, and the Rev. C. Parish. Bulbs clavate, 2 inches high, half an inch in greatest breadth. Leaves two, parchment, ligulate, blunt and unequal at apex. The peduncle is clothed with white short hairs. Raceme very dense, flowers to all sides, light sulphur-coloured at beginning of expansion inside, later more ochroleucous. The Rev. C. Parish has observed some brownish-purple zone around the disk of the lip. This I do not see in Mr. Low's fresh plant. It may not always be the case. The oblique calli over the sinuses of the lip are deeper sulphur-coloured. The flowers are woolly outside. Dr. Lindley's diagnosis is excellent. I have only to urge that the learned author says the hairiness is grey ("spicis lateralibus elongatis griseo tomentosis"). This may be the consequence of specimens having been much advanced when collected (as those of Dr. Griffith were decidedly), or to the specimens having been kept long and submitted to unavoidable London dust, or, as I suspect, in consequence of the specimens having been washed with a certain concentration of solution of corrosive mercury. I have the strong belief of having seen some such changes in the colours of hairs. Mr. Low was so kind as to send a very good specimen.

Dr. Lindley takes as next neighbour *Eria stricta*, Lindl., an elegant species, with one-sided woolly inflorescence, which I have twice recently received from Dublin—first from Mr. F. W. Barbidge, and then from Mr. Moore. *H. G. Rehb. f.*

### *CHYSIS SEDENI*, n. hybr. (LIMMINGHII × BRACTESCENS).

This is a curious thing. It bore an upright two-flowered pedicel, with flowers much like those of *bractescens*, generally white, but with smaller bracts, though those organs are larger than in *C. Limminghii*. The petals have a few mauve streaks at apex. The lip is light ochre-coloured to white with keels on the disk, downy at the base, just as in *C. Limminghii*: the side lacinia with elevated purple or stronger yellow keels inside; the middle lacinia painted with mauve-coloured streaks. The column is purple, rather rhomboid, light ochre-coloured with red streaks and lines in front. Thus the lip is of *Chysis Limminghii*, though the colour is that of *C. bractescens*. This is one of the numerous products of Mr. Seden's skill, in whose honour it is named at Mr. Harry Veitch's hint (March 15). Mr. Harry Veitch wrote "The mother is *C. Limminghii*; habit of plant much more like that of this species than like that of *C. bractescens*. The bulb from which the blooming growth is produced is 6 inches long." *H. G. Rehb. f.*

### *DENDROBIUM SCABRILINGUE*, Lindl. (*HEDYOSMUM*, Bat.)

This plant is an old favourite with amateurs, not so much for its form as for its perfuming the air in a most delightful manner. Its ivory-white flowers show a lip with a yellow middle area, and red asperulous veins on the lateral segments. It was sent over in 1862 by the excellent Rev. C. Parish, from Moulmein, to Mr. Stewart Low, under the name of *Dendrobium albovidense*—a name given because the flowers when expanding have this tint, which soon gives way to the above-mentioned colours. The name was, therefore, altered by Mr. Bateman, and this gentleman expressed (Hook., *Bot. Mag.* 5515) his hopes that the change would be approved by Mr. Parish himself. As to this delicate point I do not feel quite clear, the more so as I never spoke of it with the gallant explorer of Burmah; but what I know is, that the species was described earlier by Dr. Lindley himself as *Dendrobium scabrilingue*. The description is Lindleyan, short and acute, but the indication of Borneo as its origin may be founded on a mistake. Thomas Lobb, the dear old veteran, was the discoverer of the species; and having travelled both in Burmah and Borneo, a confusion may have originated in some way (see Lindl., *Journ. Linn. Soc.* iii. 15). Fresh flowers and plants were kindly sent me lately by Messrs Low. *H. G. Rehb. f.*

## CARPET BEDDING.

AMONGST the admirable examples of carpet bedding carried out by Mr. William Gibson in the Royal Hospital Gardens, Chelsea, last season, none were more effective than the bed of which we now give a plan and cross section, fig. 105. The outer margin, A, was composed of *Echeveria secunda glauca* filled in with *Sedum glaucum*. The lines B were planted with *Pyrethrum Golden Feather*; the spaces marked C with *Alternanthera amena*, and D *Mentha Pulegium gibraltaricum*; the dot plants at E being *Chamaepucea diacantha* carpeted with *Sedum glaucum*.

## MORE LIGHT.

THIS has ever been the cry of the gentle art. Like the dying Goethe when about to exchange the light of this world for that of the next, its cry has ever been for light—more light. The four elements of the ancients—earth, air, fire, and water—the originators of force, the semi-creators of matter, have been available for our use. We could use, reject, weaken, or intensify their energy at pleasure; but light was a limited quantity, varying with our geographical position, and its volume or energy was almost or altogether beyond the power of man. The qualifying words are used advisedly, for light could be intensified and virtually increased by mechanical construction and the application of the natural laws of refraction and reflection. It has long been known that the energy of the light brought to bear on the plants in a house is much modified by the angle it presents to the rays of the sun. Attempts have also been made to concentrate as much light as possible into a given area, and to use this light at

in a sentence thus: light for a longer period than the sun gives us in our climate—an artificial light almost equal to that of the sun when he is weak or absent. All previous attempts to provide these dual wants have hitherto failed. It must, however, be admitted that the most has never been made of gas nor of mineral oils for horticultural purposes. Not till these and other illuminating agents have been thrown on the defensive by the electric light, have we, by the aid of new burners, been able to consume nearly all the combustible elements in these and other illuminating materials. The result is a luminous flame with hardly any darkness or opacity in it, and were these flames brought to bear properly on vegetation, it is probable that very beneficial effects might be obtained. A very powerful heat is also given out by these improved burners. Of course the more complete the combustion the greater the warmth. And it is probable that, even apart from the use of the coming light for horticultural purposes, electricity, lighting, and heating may be more closely related in horticulture in the future than they

the rest of plants at night or in the dark is more of a myth than a fact. We keep them cooler at night than by day to prevent their too rapid extension in the dark; because of course rapid growth in the absence of the great plant builder and preparer of building materials, light, leads to depletion. But provide the necessary link or agent, light, and there seems no need for any cessation of growth. Artificial light will, therefore, become the greatest time-saver in horticulture. Horticulture already leads rather than lags behind in the race against time. The want of more and brighter artificial light, however, has hitherto handicapped her heavily; we therefore hail the electric and other pure lights as among the chief things needed to enable horticulture to consummate her triumphs by ripening two or even three crops a year instead of one. Seeds, plants, are virtually infinite in number. Time to the longest-lived is but short; time is, therefore, not only money, but additional pleasure and innocent luxury to millions; and if the electric light will give us double crops it will largely augment our national wealth, and greatly enhance

FIG. 105.—PLAN OF CARPET-BEDS AT CHELSEA. (SEE P. 616.)

second-hand for horticultural purposes. When a boy I remember seeing a large tin reflector that had been used at Methven Castle, in Perthshire, for augmenting or intensifying the solar light on a Pine-stove. It was out of repair at the time I saw it, but it had revolved on an axis so as to collect as many rays of the sun as possible at every hour of the day, and to bring them to bear on a Pine-stove. If I remember rightly a Mr. Bisset was gardener at the time this contrivance was in use, and if he, or any one who lived at the time of the solar reflector is now alive, a detailed account of it could hardly fail to be of interest. No doubt it would be possible to thus increase, to a great extent, the intensity of solar light, and could some simple means be adopted for this purpose during the late autumn, winter, or early spring, considerable benefit might be derived from the use of reflectors. But unfortunately, just when light is most needed for the early forcing of flowers, or ripening of fruits, there is the least amount of solar light to reflect; and as the summer advances solar light is sufficiently powerful, without being intensified by concentration or reflection. The light wants of horticulture may be summed up

have been in the past. Why should all our heat be generated in dark, dirty stoveholes—cribbed, cabined, and confined in boilers or hot-water pipes—married to and fettered by sluggish wasteful water, while twenty lamps in the house itself or reflected upon its roof, would probably yield as much or more heat at less cost, and make the plant-houses almost as light as day into the bargain. But then the dry air, the gaseous products of combustion, the dangerous excitement of the plants, all would prove injurious or fatal. Why should not all these evils be avoided or so modified by science as to become in practice helps instead of hindrances? Take the last, for example: what do we really know about the over-excitement of plants under the influence of intense light? The example of the tropics seems to prove that the more excitement the better. The plants make short work in these regions from the start to the finish; nay more, unless arrested by drought or cold, few of them ever finish growing, flowering, or fruiting. Like Tennyson's brook they flow on and on for ever, and seem to thrive and grow into an ever-verdant condition under this species of vital perpetual motion. Even

human happiness. And if it should not accomplish so much, it may help us to turn winter into spring and summer with more certainty and ease. The experiments already made by Dr. Siemens, and described in your pages, are full of promise, and as the spectrum formed by the electric light is identical with the solar spectrum, there can hardly be a reasonable doubt but that its effects, if used of sufficient intensity and continued long enough, will prove almost identical. The successful experiments of Dr. Siemens and his able gardener, Mr. Buchanan (see pp. 404 and 432), have settled this point. Like solar, the electric light enables plants to build up structure, causes extension of parts without weakness, and enables them to transform crude sap into finished products. The saving of time will also probably be in the ratio of the energy of the light employed. Even the question of cost is well nigh solved. By what other force or energy would it be possible to obtain 1400 candlelight for 4*l.* or 6*l.* an hour? Considering also that the two great sources of the artificial production of electricity for lighting purposes are chemical combination and magnetic induction, the

cost of the production is likely to be still further lowered as discovery advances, and the application of electricity to horticultural and other purposes becomes better understood.

You have already remarked that the substitution of water for steam power or gas engines would lower the cost of production. In hundreds of gardens the wasted force of running water in rivers and rivulets might be utilised in the production of any amount of electrical force for illuminating purposes. Large forcing establishments might also be built on the banks of streams and rivers, and the force of natural waterfalls be utilised for horticultural purposes. Why, to say nothing about the greater falls, such as Niagara, &c., the falls of the Clyde alone would have sufficient force to light with electricity any number of flower or fruit factories between Lanark and Hamilton, in Clydesdale. The driving force of the wind, if more erratic in its motion, is everywhere available. True, it might not always be forthcoming when wanted, but then electric light is not always needed, and the winter and springs months are among the most windy in the whole year. And surely it will pay horticulturists to copy the example of the miller, who sets up steam engines to rest in peace while the wind continues to turn the sails, steam only doing the work of wind when the latter ceases to blow.

Besides these natural forces, there are artificial ones in most gardens, that a little constructive skill might convert to the service of electric lighting. For example, there is the draught up the chimney, which represents a very powerful driving force, that is now wholly wasted. If the draught in one kitchen chimney suffices to turn the spits that roast the joints of which we are so justly proud, surely the far stronger draughts in our furnace chimneys might afford sufficient mechanical power to furnish us with a portion at least of the electricity for horticultural lighting.

Again, a portion of our boiler force might surely be diverted to lighting purposes. Mechanical skill might even turn a portion of the energy of the circulation of our hot-water apparatuses to account in the production of electrical force. But if this were found impracticable, a portion of the boiler could be portioned off for this purpose. The terminal end, for example, at the mouth of the flue, could be devoted to the generation of electrical force and furnished with independent flow and return to act with sufficient energy for this purpose. This would add a new link to the chain of correlated force you so well describe at p. 432, viz., the diversion, or rather utilisation of force already in use in gardens for electrical purposes. True all this might be transitional, as it is quite possible that in the future our hothouses might be heated as well as lighted by electricity. Well, in that case, we have only to fall back on gas or common steam-engines for the production of our light and heat, and from the experiments already made it seems probable that horticultural structures may ultimately be warmed as well as lighted by electricity, gas, or even mineral oils, at less cost than that at which they are now very imperfectly warmed. For the present, however, we must look on electricity as an illuminating rather than a warming force. All other practical matters, such as the best distance of the electric light from the plants, the most perfect means of equally diffusing it over the area of an entire house, and the cheapest means of generating and adjusting the chemical or mechanical force needed to give it steadiness and uniformity of energy, may safely be left to the skill and energy of the many eminent scientists and mechanical inventors who are now engaged in perfecting the electric light for utilitarian purposes. As a horticulturist always on the outlook for more light, intellectual, moral, special, and general, allow me to express my pleasure at the advent of this new light within the domain of practical horticulture, as I firmly believe its sterling utility and solid advantages in this new sphere will ultimately overshadow and eclipse, as it were, its dazzling brilliancy, and semi-solar energy. A new sun has indeed arisen in our gardens, and though it may not arise in the East just yet, I hail with great gladness the brightness of its rising, as it will doubtless crown our useful and gentle art with richer plenty and higher beauty, and bring more light as well as sweetness to my brother workers, who have all along toiled hard through the darkness and semi-twilight of our winters and springs to reach that perfection in forced fruits, flowers, vegetables,

and plants, which the new light will soon enable us to attain with ease. May our inventors and employers speed its dawning, so that should we, in direct contradiction to general anticipation, have another sunless summer, we may be able to supplement the paucity of the sunlight by electrical lamps this autumn to the ripening of our wood, in the plumping up of our fruit-buds, so that our fruit baskets may at last be filled in 1881. *D. T. Fish.*

## KIDNEY BEANS.

(Concluded from p. 554.)

THE Runner Beans are much larger in the seed than the dwarf varieties, and also of much stronger growth. The species of Runner Bean is regarded as *Phaseolus multiflorus*, and the varieties of it which we cultivate in our gardens are distinguished by the seedlings, leaving their cotyledons underground, in being of a perennial nature if protected from cold, and by the racemes of flowers being as long or longer than the leaves, while those of the others are generally much shorter.

The Scarlet Runner is the leading market Bean among the runners, and it is largely grown in many of the market gardens contiguous to London's rich and famous town. When grown for market the Scarlet Runner is very seldom poled, as in private gardens; but the leading shoot is pinched out after the plants have attained a certain height; this causes them to put forth lateral growth, which keeps the plants in longer bearing than when allowed to climb about supports. The Painted Lady is quite a distinct Bean from this, and being decidedly earlier is of more value in the market than the Scarlet Runner. In the West of England, where early vegetables are produced in great quantity, the Painted Lady Runner is largely grown, for the market gardeners there are fully alive to its value. The Bristol markets receive great quantities of this Bean. The Eclipse and New Zealand Runner Beans did not prove successes in this country, though some gardeners think very highly of them. The former came from Germany, the latter from France. The Dutch Runner, a white Bean, known also as the Giant White Runner, finds much favour with many, who regard it as a more abundant bearer and as superior to either the Scarlet or Painted Lady Runners in quality. Some of the London market gardeners are beginning to grow this Bean largely, and find it a productive variety. The German-grown seeds of this Bean are much smaller than those of English growth, though the same. Probably the best part of the seed is imported from Germany; one of our leading wholesale houses gets through some 500 bushels in a season.

A large number of Beans are grown in England, though many are imported from abroad, *i.e.*, France, Germany, Holland, &c. The great Bean-producing county in this country is Essex; in fact, it is the only county where they are grown to any large extent. The seedsmen make contracts with the growers, as in the case of Peas, sending out their own seed, and receiving back the produce at so much per quarter. When received from the seed farms they are sifted and picked over in the same way as Peas. It sometimes happens that a leading seed firm will have from 100 to 200 acres of Beans, and in a good season this quantity of land will produce from 2000 to 3000 bushels. But as Beans are a precarious crop in a bad season, such as that of 1879, when 100 acres did not return half the quantity of seed sent to be sown, it is necessary, as a precautionary measure, to have contracts with growers of Beans in France, Germany, and Italy. Beans are largely grown in America, but the dwarf varieties are very liable to run (much more so than those grown in Europe), and the seed houses buy from our Transatlantic brethren only when absolutely necessary to do so. The Dutch have produced a rather larger seeded Scarlet Runner than of English growth, but it has no other advantage. Scarlet Runners are largely grown in Germany and Austria. It can be stated as an ascertained fact that Beans of foreign growth retain their vitality longer than those of home growth.

In this country only the miniature pod of the Beans is used as a legume. The ripe seeds known by the name of Haricots are prepared in various ways as a favourite edible in France, where the dwarf white Kidney Bean is extensively cultivated as a field crop to furnish a supply of these seeds, which are in so constant demand. As a farinaceous seed for the food

of man the Kidney Bean is considered by the French as being far superior to any other legumes, and next to, if not of equal importance, with Wheat. The seeds of the Dutch Runners, which are larger than the Haricots of the French, and of a superior quality, are made into a kind of soup, which is held in much esteem in Holland. The leaves likewise of the Kidney Bean afford, when boiled, a culinary vegetable which the Nubians consider an excellent esculent. In this country, however, notwithstanding that many of the earlier varieties might be grown to advantage on light, early soils, their culture has hitherto been scarcely extended beyond the gardens of the opulent; and even there Kidney Beans occupy but a small breadth comparatively, the pods being used in a green state when half grown. The humbler classes are cultivating them rather more than they did a few years ago; but, with the exception of the Scarlet Runners, but few Kidney Beans are cultivated by them.

How different it is in France, and other countries of Europe, as also in the Canadas and United States of America, and elsewhere, for in these Kidney Beans are not only used in a green state, to a much greater extent than in this country, but are cultivated in the fields and by every cottager who possesses a piece of garden ground, for their ripe seeds, of which they make various kinds of dishes, and consider them of as much importance in their domestic economy as the cottagers in this country do Potatoes. Unlike the common Longpod and Windsor Beans, the kidney varieties do best in a light, sharp, and rather dry soil of medium fertility, and the produce, per acre, even of some of the dwarf varieties, is often more than double that of any other cultivated legume.

Some varieties of the Kidney Bean are found in cultivation throughout almost every civilised country of the western as well as the eastern hemisphere. The small black Beans, called *fricollis*, which are in general demand all over Mexico, are in all probability a kind of Kidney Bean. Travellers in that country relate that immense fields of these are under cultivation for the supply of the large cities, where they form a part of every meal, and are not only in great favour with the inhabitants, but are considered excellent even by strangers. *R. D.*

## THE TRENTHAM YOUNG GARDENERS' MUTUAL IMPROVEMENT SOCIETY.

WE are always pleased to hear of the success of the mutual instruction associations formed by the *employés* in private garden establishments. When well conducted, their tendency is altogether for good; their influences are indeed beneficial in many ways, apart from the direct professional advantage that must be derived by some or all of the members whenever a professional subject is broached and discussed. Young men (not young gardeners only), when freed from restraint, are often led innocently to spend their leisure hours in pursuits which by-and-by draw them into vicious habits, and the discipline of necessary attendance at such home meetings as these once or twice a week acts in all such cases as a salutary counterpoise. There is besides so much to be learnt before a young gardener can be considered well informed in the practice of his art that every moment which can be devoted to this object is a clear gain, and the information will go far to fill in the blanks in the experience of each individual, and thus help to prepare him for occupying the advanced position to which each one naturally looks forward. On this point our advice would be that at least the paper prepared on the subject for discussion should be confined to a statement of the writer's own experience, and should avoid theory, of which he is not likely to know much that is useful. Any one present qualified to do so might advantageously turn on the light of theory in the course of the discussion, but it is from each other's own practice and experience that the largest amount of useful information may be expected to be gleaned.

An association of the character referred to, called the Trentham Mutual Improvement and Debating Society, has been recently formed in the garden rooms at Trentham, and we have before us a list of the papers read during the first season, the meetings being now broken off for the summer months. Attention has been directed to a variety of interesting subjects, and we trust the young men who

have taken part in the enterprise will have had their reward in more expanded views on many at least of the subjects discussed.

We are glad to learn that the meetings throughout have been successful. The amount collected in fines was 11s. 10d., which was made up to £1 1s., and sent as a donation to the Royal Gardeners' Benevolent Institution—a very fitting appropriation. The meetings are intended to be resumed in the autumn.

COLOUR STATISTICS.

FOR some time past I have been accustomed to make notes of the seasons of the year at which flowers of different colours are obtainable. For convenience I have grouped them under nine headings, though it must be confessed that it has not always been easy to determine under which of two colours certain flowers should be placed. As, however, such instances form only a very small minority, I am in hopes that the remarks which I shall make will not be far from correct, even if there should be some trifling inaccuracies in the numerical statements upon which they are based.

My flower-colours are divided under the following headings :—

- |              |             |            |
|--------------|-------------|------------|
| 1. Blue.     | 4. Pink.    | 7. Orange. |
| 2. Purple.   | 5. Crimson. | 8. Yellow. |
| 3. Lavender. | 6. Scarlet. | 9. White.  |

It will be noticed that the order of arrangement is consecutive. Under the term lavender I include mauve, magenta, and all the numberless shades which are formed by the mixture of blue or purple with pink or crimson. The difficulty of drawing a line between crimson and scarlet will readily be realised on examining a collection of Zonal Pelargoniums or tuberous-rooted Begonias.

The number of genera (for I have not gone into species or varieties), of which I have made lists, are as follows :—

- |               |              |             |
|---------------|--------------|-------------|
| Blue, 18.     | Pink, 42.    | Orange, 18. |
| Purple, 21.   | Crimson, 41. | Yellow, 31. |
| Lavender, 19. | Scarlet, 21. | White, 72.  |

Had I attempted to enumerate florists' flowers, or even botanical species, it would have entailed greater labour than I could spare time for; but if any one likes to take up this subject on a broader basis they will, I expect, arrive at results not differing materially from mine.

These numbers might also have been considerably increased if I had included Orchids and rare plants generally, but I deemed it sufficient to confine my lists to those greenhouse and hardy plants which are commonly cultivated, and to those wild plants of distinctive colours which are generally procurable.

The number of kinds of flowers of each colour which are obtainable during the several months of the year is shown in the following table :—

TABLE SHOWING ACTUAL NUMBER OF FLOWERS OF EACH COLOUR IN BLOOM IN EACH MONTH.

Colours of Flowers.	Jan.	Feb.	March.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Actual Number of Genera.
Blue...	3	4	6	9	10	11	12	11	10	5	1	2	18
Purple...	4	5	6	8	11	11	8	9	8	5	3	3	21
Lavender...	8	8	8	9	12	6	4	6	6	7	7	7	19
Pink...	15	16	17	20	20	18	20	24	22	13	12	14	40
Crimson...	10	9	11	14	17	16	19	23	17	13	9	11	41
Scarlet...	9	9	9	8	10	10	13	16	14	9	6	8	21
Orange...	5	5	7	8	9	8	8	10	9	8	4	4	18
Yellow...	8	10	11	12	12	17	14	15	12	8	6	6	31
White...	33	34	37	30	40	34	35	29	23	24	23	29	72

If the colours to be had in each month be added up the following result will be arrived at :—

- |             |              |             |
|-------------|--------------|-------------|
| Jan., 95.   | May, 148.    | Sept., 112. |
| Feb., 100.  | June, 131.   | Oct., 89.   |
| March, 112. | July, 133.   | Nov., 71.   |
| April, 118. | August, 143. | Dec., 84.   |

From this it appears that the fewest flowers are to be had in November, whence month by month there is a gradually increasing number until April, and then there is a sudden advance to the highest point, when the greatest number are obtainable, in May. After this month the number suddenly diminishes, but rises again nearly to the maximum in August, whence the numbers rapidly decline until the minimum is reached (as before stated) in November.

An examination of the table in detail will show to what extent the separate colours follow or depart from the general results.

*Maxima.* — Four of the nine colours (purple,

lavender, yellow, and white) present us with the greatest number of flowers in May; four other colours (pink, crimson, scarlet, and orange) have the greatest number in August; while the remaining colour, blue, has its maximum in July, and has nearly as many flowers in the two preceding and the two following months. Purple has the same number in May and June.

*Minima.* — Seven of the colours have their smallest number of flowers in November; these are blue, purple, pink, crimson, scarlet, orange, and yellow. White has the fewest in October; while lavender presents the anomaly of having its minimum in July. Purple has the same number in November and December; and crimson has the same number in February as in November. *H. T. T.*

SIR TREVOR LAWRENCE'S ORCHIDS.

(Concluded from p. 520.)

No. 9 HOUSE.

THIS is a portion, cut off, so to speak, of the house we have been descanting upon, only it is treated, or was at the time of my visit, to the full influence of solar light. Doubtless, it was a proper system for bringing renegade Cattleyas into flowering condition, only the experiment might be carried a step farther than the person in charge might be able eventually to correct. A monster *C. Mendeli* was resting, and of the great-bulbed *Gigas* several plants were submitted to this toasting process. *Sobralia macrantha* we could understand, and even *Dendrobium Falconeri*, which before buds evolve must get some sort of check to keep them in the happy medium between flower and foliage production. *Dendrobium Ainsworthii* was here also, and lots of *Cattleya citrina* hung up like herrings, to harden in the flesh, and several other things.

No. 10 HOUSE.

This forms the first of a new range, elegant without being absurdly costly, and glazed with Hartley's plate glass, to do away in a measure with shading. This forms the division exposed under the influence of a west aspect. Here were *Epidendrum nemorale* in quantities, also *Lælia albida* and several of its congeners, particularly good being many of the plants of autumnalis. *Odontoglossum Londesboroughianum* is a wayward subject, not only in respect of its pseudo-bulbs, but its tall gaunt flower racemes—the flower individually is worthy of admiration; the habit of the plant, unless it can be induced, like *cirrosum*, to dwarf its pretensions after cultivation, is not at all desirable. The somewhat rare *Epidendrum Parkinsonianum* is here, and so is the white *Sobralia virginialis* in good order.

No. 11 HOUSE.

This division is tenanted with a miscellaneous assortment, and it is here where the Phalenopsis are grown. *P. Schilleriana* is doing fairly well, and so are some of the *amabilis*—the miffy *grandiflora* being, as is invariably the case in general collections, worst done. The house is low and moist, and, so far as we can cater for growth, likely enough to induce extension of leaf-growth and flower production. *Catasetum scurra* is a sweet-scented grotesque-looking subject, greenish-white, with radiated lines. *Aerides Lobbiai* in this climate, for its size, and it is goodly, is simply magnificent; and there are very good pieces of *Angreecum sesquipedale*, both the ordinary and summer flowering varieties. Nothing is richer in its way than the ivory-white *Chysis bractescens*, which is relieved with a spice of yellow on the crest of the lip. *Oncidium ampliatum* was in strong masses, and prominent also

were *Dendrobium Schroderi*, *Cypripedium Stonei* with a good dozen growths, *Vanda Lowii* and *Vanda insignis* of Blume, which is a very slow growing plant, but when in flower of unmistakable excellence.

No. 12 HOUSE.

This is the new cool-house built to command the eastern as opposed to the western aspect, and fitted in every way like the *Odontoglossum*-house already described. It has an additional advantage in having a grated path with a space underneath to collect water that trickles down from the stages, and to drain paths as well at all times. The moisture in this case is not lost but only placed out of range of the feet, and comfort to promenaders is thereby secured. There are some excellently grown plants here: to name all would be tedious. Omitting much that might make a good story, we might name *Odontoglossum Alexandræ roseum*, a marvellously fine plant, and an exquisite variety, which has already won honours at our horticultural "Royal"; then *O. Andersonianum*—one raceme four-branched with twenty-seven flowers, and another with four flowers, both racemes from one matured growth. There are several here of this species: the one similar to what I afterwards saw at Mr. Bull's under the name of *Ruckerianum* may be said to be a yellow ground *Andersonianum*, just as *O. odoratum* is a yellow ground *gloriosum*—no specific difference, I presume, merely colour difference. There is such a variety in both these multitudinous spotted species—I refer to *Andersonianum* and *gloriosum*—that each would require to know what they were taking home. There is quite as great diversity in *Alexandræ*; some are starry, others dull and insipid-like in the spotting, while others are fine in every way. The two types which take my fancy, and of which there were a plentiful crop here, are the very wavy segmented ones, crisped like a Parsley leaf, and bearing a good long close raceme; the other, the pure florist's flower—broad, flat, and well defined, with spots not crimson or purple, as some describe them (they would be glorious to look upon if they were so), but of a bright Indian-red, and occasionally with a purple dash suffused. Then *O. Pescatorei*, in some sorts here white with ruby band up the back of the segments, in many indefinitely blotched, and in others spotted, which is far the most rare—purity of whiteness, with the exception of the faint yellow dash on the crest of the lip. One or two very good samples were in flower, although doubtless there are many more of them evolved now. *O. cirrosum* *Klabochorum* is a highly-marked, beautiful variety. Without this for March and April work, the person that has to supply Orchids for cut flowers would find some trouble to meet a pressing demand. Then *O. pulchellum* is of first importance, and is well-grown in this cool-house, as also *O. radiatum majus*, *Edwardsii pardinum*, with its yellow flowers, and reddish spots—one of the not least distinguished among recent introductions. Then *O. zebrinum*, plenteous in its formation of bulbs, but shy as a flower-producer; *serratum*, *macranthum* especially grand, revelling in the cold, and its bulbs distending to extra proportions; *Lycaste Skinneri*, in good lumps, evidently treated to a warmer winter house; then *Epidendrum myrianthum*, and the rare *erubescens*, which most culturists abandoned in despair years ago, but now reintroduced with such bulbs as to give a chance for prolonging life and inducing flower racemes. In these days of high prices and desire for white flowers, we must not omit to name a plant of *Lycaste Skinneri alba*, which had three growths or leads, and some of the back bulbs like a good-sized *Victoria* *Potato*: but this has been relegated to the next compartment, although its coloured fellows bask in this atmosphere.

No. 13 HOUSE.

This house is twice the width of No. 12 house—in truth the division wall separating the eastern aspect house from the two western aspect houses has disappeared, if ever it were present, and No. 13 house has both exposures as well as the gable exposure to the south. In this case it needs must have a great central table of 12 feet—the 3-foot paths, and then the 3-foot side tables. It holds a large quantity of plants, and here, as everywhere, fellows from different parts are induced to live comfortably together. In this division there are large quantities of *Cattleya Mossie*, a grand plant of *Lælia elegans alba* with fifty bulbs. *Cypripedium Henckianum*—a dwarf *Koezlii*, good masses of *Cypripedium Lowii*, fine *Cattleya lobata*, and strongly

developed pieces of *Dendrobium superbiens*, as well as *densiflorum*, and many of the yellow drooping-racemed *Dendrobes*. Here also was *Odontoglossum Reichenheimii* with immense bulbs, showing how well it likes a moderate warmth; also *O. citrosum* in great variety—splendidly managed plants crowded with flower-racemes, many of them branching; *Dendrobium speciosum* and the Wallich form of noble growing side by side, as also several good starts of *Vandas*, particularly one of the tricolor section called *Russelliana*. This is a decidedly good thing, large, broadly-limbed, and good in substance. *Angraecum eburneum* in its large form was well represented—in indeed in the midst of so many eburneums the fine varieties of this species are apt to be overlooked. *Oncidium aurosium*, too, so useful in September, was in rude health, and so were many *Lælia purpurata*, *Cattleya Leopoldii*, *amethystoglossa*, and the captivating *Oncidium fuscatum*, with long erect racemes coloured in the lip like a carpet design in colours of faint purple-lilac and white in soft suffusion, well balanced, and positively elegant. Here the *Lælia anceps* and its varieties were well grown; one plant in particular would have quite 300 bulbs, and the leaves surmounting them ovate, and without a speck.

Such, notwithstanding the space I have occupied, is but a brief *resumé* of the treasures Sir Trevor Lawrence has got together, and has succeeded in keeping in such condition as my remarks will only have but faintly conveyed to those who have not had the privilege of seeing them. I do not require after this to add a certificate to the cultural capabilities of Mr. Spyers, upon whom the chief responsibility of maintaining in order this exceedingly valuable collection of Orchids rests: the plants speak for themselves. *James Anderson, Meadowbank Nurseries, Glasgow.*

## A SYNOPSIS OF THE SPECIES AND FORMS OF EPIMEDIUM.

The species and hybrid forms of *Epimedium* are now widely cultivated, but the names in gardens and garden catalogues are in a state of great confusion. This is partly because there is no available general synopsis in existence to which reference may be made, and I am therefore attempting in this present paper to supply what is required in this direction. There is considerable discrepancy amongst systematic botanists as regards the nomenclature of the rows of floral whorls. The flower has three rows of parts, normally of four members each, placed opposite to one another, outside the stamens. Following Bentham and Hooker in *Genera Plantarum*, I intend in the descriptions which follow to regard the outer row as an outer row of sepals, the second row as an inner row of sepals, and leaves of the third row as petals. Regarding *Aceranthus* as not worth separating generically from *Epimedium*, the species range themselves in three well-marked groups, as follows:—

GROUP 1.—Petals spurred. Peduncle not produced direct from the rootstock.

\* Petals with scarcely any lamina, and the stamens and style much exceeding them.

- |                      |  |                     |
|----------------------|--|---------------------|
| 1. <i>E. alpinum</i> |  | 2. <i>E. elatum</i> |
|----------------------|--|---------------------|

\*\* Petals with a distinct lamina; stamens and style not protruded from the cup in the centre of the flower.

- |                        |  |                          |
|------------------------|--|--------------------------|
| 3. <i>E. rubrum</i>    |  | 5. <i>E. Musschianum</i> |
| 4. <i>E. concinnum</i> |  | 6. <i>E. macranthum</i>  |

GROUP 2.—Petals yellow, with a small spur. Peduncles produced direct from the rootstock.

- |                               |  |                         |
|-------------------------------|--|-------------------------|
| 7. <i>E. Perralderianum</i> . |  | 9. <i>E. pinnatum</i> . |
| 8. <i>E. pteroceras</i> .     |  |                         |

GROUP 3.—Habit of Group 1, but petals destitute of spur (*Aceranthus*).

- |                          |  |                            |
|--------------------------|--|----------------------------|
| 10. <i>E. diphylum</i> . |  | 11. <i>E. sagittatum</i> . |
|--------------------------|--|----------------------------|

1. *E. alpinum*, Linn., DC. Prod. i. 110; Eng. Bot., t. 438, edit. iii., t. 52; Buxt. Brit. Bot., t. 47. — Rootstock woody, wide-creeping. Fully developed leaves about 1 foot long, biternate (that is, composed of nine leaflets), the common petiole about  $\frac{1}{2}$  a foot long, glabrous, the leaflets bright green, cordate-ovate, 2–3 inches long, not firm enough in texture to last through the winter, glabrous above, finely hairy all over beneath, ciliato-dentate, the three end ones of the triads equal-sided, with short rounded basal lobes, the six side ones of the triads oblique, with much larger basal lobes, the lobe of the outer side twice as large as that of the inner. Flowers 12–20, in a lax panicle about  $\frac{1}{2}$  a foot long, which springs from the side of the common

petiole about a couple of inches from its apex; pedicels erecto-patent, finely glanduloso-pilose, the upper ones simple, the lower ones bearing often 3–5 flowers; bracts minute, lanceolate. Expanded flower about  $\frac{1}{2}$  an inch in diameter; outer sepals oblong, convex on the back, greyish,  $\frac{1}{8}$  inch long, soon falling; inner sepals more persistent, oblong-lanceolate, dark crimson,  $\frac{1}{4}$  inch long, patent in the expanded flowers; petals yellow, with scarcely any limb, composed almost entirely of a slipper-shaped yellow spur a little shorter than the inner sepals, forming a central cup not more than  $\frac{1}{2}$  inch deep. Stamens and pistil at least twice the length of the central cup.

This typical form is widely spread as a wild plant in Central Europe, and has been cultivated in our gardens and shrubberies from time immemorial.

Var. *pubigerum*, Morren and Dene. in Ann. Sc. Nat. 1834, p. 354; Boiss. Fl. Orient. i. 101; *E. alpinum* var. *pubigerum*, DC. Prod. i. 110; *E. alpinum*, Sibth. and Smith, Fl. Græc., tab. 150.—Rhizome shorter than in the type, so that the stems and leaves are more crowded. Raceme more densely glanduloso-pilose. Inner sepals a paler undecided yellowish-red. Petals and stamens as in the type.

This is the Oriental race of the species, which inhabits the Caucasus, Armenia, and the neighbourhood of Constantinople.

2. *E. elatum*, Morren and Dene. in Ann. Sc. Nat., ser. 2, vol. ii. (1834), p. 355; Dene., in Jacquem. Voy. Bot. 9, t. 8; Hook. fil. and Thoms. Fl. Ind. i. 112.—Stems 2–3 feet long, slender, erect, glabrous, straw-coloured, bearing two or three leaves below the inflorescence, and an ample terminal panicle, with reduced leaves from the axils of its branches. Fully-developed leaves ternately compound, consisting of as many as thirty or forty leaflets, closely resembling those of *E. alpinum* in shape and texture and tooting, all distinctly petioled, but the end ones with a shorter, more open basal sinus, and the side ones not so unequal at the base. Panicle 1 foot or  $\frac{1}{2}$  foot long and broad, the leaves from the axils of its lower branches usually ternately compound, of its upper branches simple; flowers very laxly and subcoarctately disposed; pedicels long, ascending, and very slender, densely glanduloso-pilose. Flowers pale yellow, not more than  $\frac{1}{4}$  inch in diameter when fully expanded, very fugitive; outer sepals oblong; inner sepals ovate-lanceolate, acute, not much longer than the outer ones; petals without any distinct lamina, the incurved spur shorter than the subtending inner sepals. Stamens much protruded from the central cup formed by the petals.

A native of the subtemperate region of the Western Himalayas (Kistwar, Kashmir, and the Chenab Valley), at an altitude above sea-level of 6000–8000 feet. Thoroughly distinct from all the other species by its tall habit, and stem with several leaves and ample terminal panicle.

3. *E. rubrum*, Morren in Belg. Hort. 1854, p. 33, tab. 6, figs. 1–6; Regel, Gartenfl. 1862, p. 311, tab. 373, figs. 4–7; *E. alpinum*, var. *rubrum*, Hook. in Bot. Mag., t. 5671; *E. Morren*, in Belg. Hort. 1868, p. 199, tab. xiv., No. 2.—Habit entirely of *E. alpinum*, but more robust, the leaves varying from biternate to almost triernate, and the leaflets sometimes as many as twenty. Leaflets just like those of *alpinum* in shape, texture, and tooting. Panicle springing, as in *alpinum*, from the petiole 1 inch or 2 inches below its apex. Expanded flowers  $\frac{3}{4}$ – $\frac{1}{2}$  inch in diameter; outer sepals oblong, greyish,  $\frac{1}{8}$  inch long, soon deciduous; inner sepals bright crimson, oblong-lanceolate, very convex on the back,  $\frac{1}{4}$  inch long, spreading horizontally when the flower is fully expanded; petals pale yellow or tinted with red, with a small but distinct erect limb, which is roundish, but broader than deep, and a concolorous deltoid-cylindrical spreading spur, which is nearly or quite as long as the subtending inner sepal. Stamens and style equaling or a little protruding from the central cup formed by the blades of the petals.

This seems to have been first seen in the Botanic Garden of Ghent, about 1854, but whether it was a hybrid produced there by M. Donckelaar, or was imported from Japan by Von Siebold, was not clearly made out. There can be no doubt that *alpinum* is one of its parents, and it is likely that *E. macranthum* is the other. It is now to be found in every collection, and is one of the handsomest and hardiest of all the genus. It varies a good deal in the colouring and absolute size and relative proportion of the parts of the flower. Sometimes the petal-lamina is very small, and then the stamens exceed it. Sometimes the petal-spur equals and sometimes falls decidedly short of the subtending inner sepal. *E. versicolor*, Morren, which I know only from the plate in the *Belgique Horticole*, 1854, p. 33, tab. 6, fig. 7, appears

to be a closely allied form, with dull brick-red inner sepals, petals with scarcely any lamina, a bright yellow spur distinctly shorter than the sepal and stamens protruded from the petal-cup. *E. Hariso*, Siebold, which I know only from the description by Regel, *Ind. Sem. Hort. Petrop.* 1868, Appendix, p. 89, appears to be a hybrid between *alpinum* and *Musschianum*. It has ovate-oblong white sepals and yellow petals, with a short cylindrical spur, an ovate lamina toothed at the apex on each side, and stamens decidedly protruded, as in *alpinum*, from the petal-cup. *J. G. Baker.*

(To be continued.)

## Foreign Correspondence.

ACROSS THE WATER: BOSTON.—Two weeks of winter weather, sandwiched between spring and summer, has given me some leisure, which I improve by noting its peculiarities.

It is remarkable with what regularity our winters are repeated. From March 1 to March 24 we had delightful spring weather, with the temperature from 28° to 40° at sunrise, and we began to prepare for seasonable work, but a long low black cloud in the east at sunrise of that day looked suspicious, and about noon the wind began to freshen and the temperature to fall. By 4 o'clock it had increased to a young gale, and the sashes on the frames went whirling through the air a distance of 20 feet with a crash that sent the glass in all directions. At sundown the temperature was 22°, and by 9 o'clock the wind was blowing at the rate of 40 miles an hour. Any loose pane of glass was immediately sent flying, and everything, to use a nautical phrase, was made "taut" for the night, and it was only by constant vigilance that Jack Frost was kept out of some of the older houses. It continued to blow for twenty-four hours, though with diminished force, and the temperature was 17° at sunrise. On looking at my diary I found we had just such a warm March and just such a gale, with the thermometer at 12°, two years ago the very same day, and closing the month of March quite cool, though not so cold as we have had it for a week or more, with 4 inches of snow, which still covers the ground (April 1); consequently all outdoor work is at a standstill. Your cultivators will see we have much to contend with, and all our planting has to be done in a very short period.

I was much struck with the paucity of American Elms and Maples in your parks. Along the Thames Embankment almost all the trees were the Oriental Plane, or *acerifolia*, which possess little merit compared with the Elms and Maples unless it is their fitness to withstand fog and smoke. [What better character for London use?] In fact all trees looked alike so far as the trunk and bark was concerned, all alike black and sooty; had I not known their peculiar wood and style of breeding I should have been unable to distinguish what they were. Here our American Elm grows everywhere and is, with the Sugar Maple, the street tree for cities as well as country. If they have been tried and found wanting, there is good excuse for selecting the Plane, but if not I should think it would be well to give them a trial.

Another tree of much beauty is what I at first supposed to be *Populus tremula*: I say supposed, for the origin of the one I refer to is a mystery to me. I have, however, looked it up, but it does not correspond with that species. Many years ago I planted an avenue of Norway species [? Maple] very thickly, intending to remove them as they crowded each other; for some years, as long as the trees were saleable, this was done; but they were still too crowded, and gradually they were cut away, leaving them still too thick for perfect specimens, but they were allowed to grow, and are now 40 feet high. Some six or eight years ago we cut out a few that run rather shabby, which made gaps and let in the sunlight. In these spots there have sprung up Cherry trees, Blackberries, Raspberries, Currants, Strawberries, *Solanum Dulcamara*, and other plants, and in one place a Poplar. It was so beautiful that I did not recognise it at first, and as I have never had any Poplar on the ground near it except *P. tremula pendula*, I could only suppose it to be a seedling of *P. tremula pendula*, erect growing, and with foliage four times as large as the parent. At any rate it is a most

beautiful tree, with foliage on the young growth fully 6 inches long, as beautiful almost as the foliage of an Anthurium, and about as velvety as a Gloxinia, deep olive-green with a reddish edging; bark ash-grey, perfectly smooth; catkins fully 2 inches long, of a rosy tinge. Yet I had my doubts, and believe it may be a seedling of *P. tremuloides*, our native Aspen, and I account for its appearance as I did for the variety of plants I have named, viz., that the seeds were brought by the American robins, who swarm among the Spruces, from the country a few miles away, where it grows wild, and were dropped where it sprung up with the others. It is just now (April 15) in flower, with long reddish catkins, which have a very conspicuous appearance. Of the flowers some writers do not speak, particularly Emerson—an important omission. But I have been struck with his remarks in the *Trees and Shrubs of Massachusetts*, where he says, "On the sprouts which spring from the roots of this Poplar the leaves are often many times larger than those of the tree, and so differently shaped as to lead one not familiar with them to think he had found a new species." This was just my case. The leaves of my tree were large and green enough, but I suppose I was "greener" in my enthusiasm about this accidental tree. Be that as it may, if our native Aspen, which is rarely planted as an ornamental tree, it is a fine one when young, whatever its defects in its dotage. I shall watch it. It is now seven years old and 20 feet high.

I write with sadness, for when my evening papers were brought in I read of the death of that veteran traveller, Robert Fortune. As I have followed Mr. Fortune in all his expeditions, as I have chronicled all he did in my magazine, and gave a list of all the plants he from time to time introduced, the loss is like that of a near friend. I had just been admiring a beautiful plant of *Azalea ovata* which I noticed lately, just in full bloom, and was at once reminded of the interesting account he gave of it in the *Journal of the London Horticultural Society*, with a beautiful coloured plate, vol. ii., p. 121. Truly what rich treasures of the garden his enthusiasm, perseverance, and knowledge opened to us; for some men would have given up all research, after being balked by the cunning Chinaman as was Mr. Fortune in his search for new things. Perhaps you recollect his story about the dark-coloured Moutan Pæonies, which he went to China to procure. He had searched everywhere for them, but could not find any, though he had seen paintings of them. One day he saw a Chinaman with a load of Tree Pæonies on the way to market to sell, and among them some of the very dark coloured ones he had so long looked for in vain. Of course he made a bargain for what the man had, and, as he says, cheap enough too, and inquired of him where he could find more. His reply was that they came hundreds of miles away in the interior of the country, inaccessible to Mr. Fortune and all outside barbarians. But he knew his man too well, so he slyly followed him at a respectable distance, and within 2 or 3 miles of the city of Shanghai he found a Chinese gardener who had plenty of all he wanted for sale.

It would take up valuable space to enumerate all the fine plants introduced by Mr. Fortune, and I only need name the Weigela, Forsythia, Tree Pæonies, Akelbia, *Spiræa Reevesiana*, *Viburnums*, Fortune's Roses, *Retinosporas*, *Azaleas*, *Exochorda*, double *Deutzia*, *Sciadopitys*, variegated Honey-suckle, &c., to show what we should miss but for his enterprise. I hardly think the English horticulturists, with their well-known generosity, have duly recognised their indebtedness to Mr. Fortune. It would be a fitting tribute to his memory to erect a monument which should be the gratuitous offering of every gardener and horticulturist in the kingdom, and I might add, America also. *C. M. Hovey, Boston, U.S.*

**JAMAICA:** *Beaumontia grandiflora* and *Roupellia grata*.—At p. 287 of vol. xiii., Mr. Syme, in his concluding remarks on *Beaumontia grandiflora*, says that the growth of that plant illustrates botanically that "rampant growth and the condition of blossoming are respective degrees of vitality, or phases of vigour, the one almost the opposite of the other."

In the view taken, he appears to conclude, and justly so, that few plants bloom during rampant growth, and attributes it to a different phase of vigour. I cannot, at present, accept this opinion, as I conclude that "phases of vigour" are subordinate

to other qualities possessed by a plant in the various positions in which it may be situated. I prefer to think that the climbing power of the plant is a quality it possesses in order to be able to attain those positions suitable to the formation of its reproductive organs; and consequently, if situated in a position requiring it, the plant climbs. If in a situation suitable for the perfection of its organs, this power remains dormant, the vigour of the plant remaining the same. The formation of reproductive organs, as a rule, is rather a slow process, and the result of the combined actions of assimilation and metastasis. Growth appears to depend in a great measure upon the quantity of matter assimilated; but if the plant is in a proper position, and has all the necessary food it requires to elaborate the requisite materials for construction, these same materials are used primarily for the production of its fruit. If not in a proper position, these constructive materials are used for extending itself to enable the plant to get to that position suitable ("where it is no longer supported") to the formation of its reproductive organs. A plant must, of course, develop itself in such a manner as to obtain sufficient assimilative power to carry on the process of extension. It must have soil, and all other conditions necessary; but when it has attained this power, the same vigour that leads it to extend itself in an unsuitable situation develops flowers and fruit in a suitable one; consequently, instead of the conditions being opposite, or nearly so, they are identical, and only illustrate the power of some plants to adapt themselves to circumstances of nearly an opposite character.

The same qualities exhibited by the *Beaumontia* are here shown by *Roupellia grata*, a plant belonging to a genus of Apocynaceæ, and nearly allied to *Strophanthus*. With me this forms a low shrub, flowering abundantly, not having apparently the slightest tendency to climb, and forming one of the most conspicuous of our cultivated plants. *J. H., King's House, Jamaica.*

### Natural History.

**DADDY LONG-LEGS (TIPULA OLERACEA).**—At the present time, when such great damage is being caused by the grubs of the Crane-fly, commonly known as the Daddy Long-legs, scientifically as *Tipula oleracea*, or *T. maculosa*, it seems an excellent opportunity for experiment as to the real use of some of the applications said to do good.

If those who are suffering would experiment, either on a large scale or even down to results, by solutions applied to collections of grubs in a bit of turf in a flower-pot (with a cork in the hole at the bottom), we might gain most valuable information. Nitrate of soda is said to be of great service. Soot has been found to be of use, and soot and guano used together has been found to be a perfect cure. In a bad case of attack recently reported to me the surface soil of the grass field had been pared, and carbonate of lime [? lime] applied. This was stated to have cured the evil; but whether it was owing to the radical remedy of fairly removing the infested soil, or to the joint action of the chemical, I do not know, and propose to experiment myself on the matter as soon as I can procure sufficient grubs.

"Crosskilling" the ground in field cultivation seems to do much good by killing some grubs and keeping the others from roving about in all directions, and damaging the plants generally.

In a bad case of attack at one of our sewage works, a low bank—that is to say, an elevation high enough to keep the fluid on the surface—was raised round the attacked field, and the sewage turned on for three days with absolute success as a cure.

It might be worth while to try flooding where, as with some of our strong lias clays, a little ridge might be raised sufficiently tenacious to keep the water in for a few days (with an expense of labour not counterbalanced by the result) in situations where water could be turned on.

It is said the grubs cannot be drowned, but we do not yet know the limitation of the time that they will endure. A very few yards of ground devoted to the purpose would show fairly what success could be expected from what may be called the "water cure." Experiments with salt lately made have been reported as a total failure, but this has been recommended as an application.

I scarcely like to speak merely from personal experience (and this also in dry weather, when the poisonous matter was not driven down by rain); but in garden cultivation I have had great success for some time back in preserving crops from attacks of slugs (previously overwhelming) by isolating the rows or patches with narrow lines of gas-lime fresh from the works.

I placed the material, or had it placed, under careful direction, so that the lines should neither touch the plants, or the draining from it, in case of rain, run down on the root-fibres near the stem; and at present the plan has answered so completely that it suggests it might be of service in preventing any roaming of larvæ on the surface.

The love of these Daddy Long-legs for wet ground has probably fostered the parents of the present outbreak in all the neglected grassy spots near hedges and woods, as well as in the Clover and grass fields during last year; and if little can be done in the way of remedy now, yet the prevention by means of sheep feeding Clover stubbles, destroying neglected grass edges to fields, and rolling grass, and also encouragement of the insect-feeding birds, might help us for the future. *O.*

### Florists' Flowers.

**SELECTION OF SHOW AND FANCY DAHLIAS.**—It is a tradition of the nursery trade to commence sending out Dahlias—that is, the propagated plants of the current spring—on May 1. In the case where a large business is done in Dahlias, it is customary to get the other plant orders cleared up by the end of April, so that the Dahlia trade should be commenced and prosecuted without break until the accumulated orders are to a great extent despatched. As Dahlias are not planted out till the first or second week in June—earlier or later, according to the state of the weather—a month or so was thus afforded to growers for exhibition to pot their plants, and get them pushed on into as large size as possible. In addition, the trade has to be supplied by those who send out new varieties, so that they in their turn can supply them to their customers.

As cultivators are now looking for the spring catalogues to make up their orders, it is a fitting time to set down a few notes on the leading varieties other than the new ones of 1879, these having been noticed on p. 568 of vol. xii. The summer of 1879 was a wet and cold one, and Dahlias grew vigorously, yet despite such drawbacks certain sorts maintained their high character, and added new lustre to their constancy. Of the Show Dahlias, as distinguished from the Fancy varieties, special mention can be made of *Admiration* (Keynes), yellow ground, edged and mottled with lake, a fine, large, useful flower, constant in all weathers; *Alexander Cramond* (Keynes), shaded maroon, large, striking in colour, very good and useful; *Christopher Ridley* (Turner), bright glowing crimson, in perfect character last season, brilliant in colour, and with a fine high centre and splendid outline; *Countess* (Keynes), pale ground edged with purplish-lilac, a most useful variety but rather coarse, owing to the abundance of wet; *Cremorne* (Eckford), yellow tipped with red, centre very fine, and outline first-rate when caught in good form; *Charles Backhouse* (Goodwin), small in size, owing to the wet, but perfect in shape; *Empress Maud* (Keynes), white, edged with purple, a good useful flower of dwarf growth; *Flag of Truce* (Wheeler), white flaked with lilac, very good and constant; *Dictator* (Keynes), bright scarlet, rich in colour and very useful for show purposes; *Ethel Newcome* (Keynes), clear primrose, excellent centre, and very constant; *Henry Walton* (Keynes), yellow ground, deeply edged with vermilion, very good and useful; *Herbert Turner* (Turner), delicate French

white, of an exquisitely tender tint, very constant and good; Hon. Sidney Herbert (Keynes), rich shaded crimson, a good useful flower of dwarf growth; Louisa Neate (Keynes), delicate pink, with creamy-white centre, very pretty indeed, and in excellent character in spite of the rain; John William Lord (Keynes), shaded orange-buff, very fine and useful; John Wyatt (Keynes), crimson-scarlet, very fine form, constant and glowing in colour; James Willing (Rawlings), bright rosy-crimson, attractive in colour, but rough on the surface, owing to the season; John Bennett (Rawlings), yellow, deeply edged with scarlet, very striking in colour, but apt to come flat; James Service (Keynes), dark crimson, rich in colour, very good and useful; James Cocker (Keynes), purple, a fine and constant variety; John Neville Keynes (Keynes), one of the best of the yellows, but the summer of 1879 was too cold and wet to bring it in good character; King of Primroses (Rawlings), a good old flower, very constant and reliable in all weathers; Lady Golightly (Fellowes), French-white, lovely in colour, but rather undersized for show purposes; Lady Gladys Herbert (Keynes), light orange, deeply edged with crimson—there is nothing to beat it of the same character, a good and constant flower; Mrs. John Downie (Keynes), pale ground, heavily edged with rosy-purple, very good indeed; Mrs. Stancomb (Keynes), canary-yellow, very distinctly tipped with deep fawn, very pretty and useful, a variety that is much improved by close shading; Ovid (Turner), very fine purple, grand in colour, a good, constant, and useful variety; O. E. Coope (Rawlings), shaded crimson, bright in colour, large and full, with a good centre; Rev. Dr. Moffat (Keynes), dark mulberry, a good and finely formed flower, but much spoiled by the wet weather; Stafford's Gem, rosy-cerise, with yellow tip, very distinct in character, indeed should be classed with the Fancies—a variety that does not produce seed; Thomas Goodwin (Goodwin), one of the best and most useful of show Dahlias, very dark maroon, almost black, well up in the centre, large, fine shape, and always to be had in good character; Rifleman (Keynes), brilliant scarlet-crimson, very bright and useful—a variety that is destined to be much grown for exhibition purposes; and Constancy (Keynes), yellow ground, deeply edged with lake, good and useful, but needs a fine summer to come out well.

Of the Fancy Dahlias some were in excellent condition despite the wet season. Those more especially deserving of notice were Charles Wyatt (Keynes), deep rose, flaked with crimson and purple, comes very fine indeed in fair weather. This variety has the peculiarity of also producing self purple and rosy-lilac flowers; both of fine quality for show purposes. George Barnes (Keynes), rich lilac, striped with crimson, flowers very large and fine, and grand as a purple self; Egyptian Prince (Keynes), orange-red striped with deeper red. This is hardly a fancy proper, and could be oftener shown in the other class: useful and free. Eccentric (Keynes), yellow ground, shaded with crimson and tipped with white; sometimes, instead of the white lip, it is edged with yellow. Fanny Sturt (Pope), red tipped with white; one of the freest and most useful of fancy Dahlias. Flora Wyatt (Keynes), orange, flaked with red, and sometimes comes pure orange; very good and useful. Enchantress (Keynes), creamy-white, striped with rosy-purple; excellent outline and size, and very useful and constant. Henry Glascock (Keynes), buff regularly striped and spotted crimson; very fine and useful, and equally good in the form of a fine crimson self. Hercules (Keynes), yellow ground, striped and speckled with crimson; very constant and reliable. Mrs. Saunders (Turner), yellow tipped with white; very useful and always to be had. Mrs. Wickham (Rawlings), white dashed with deep crimson-purple; a good and reliable flower. Octoroon (Goodwin), shaded purple, striped white and spotted mulberry; a beautiful Fancy when caught right. Parrot (Keynes), yellow striped with crimson; one of the finest and freest in this section. Prospero (Goodwin), crimson, tipped with purple; a fine flower when caught in good condition. Queen Mab (Turner), a showy and striking flower when in proper character. Maid of Athens (Keynes), dark maroon, tipped with red and white; a most useful flower, but wants liberal growth. Marchioness of Salisbury (Keynes), white ground, striped and mottled with purple; a useful flower that sometimes takes an acceptable self form.

Robert Burns (Keynes), lilac, flaked with dark maroon; a very distinct Fancy, large and full, very useful and constant, and striking in colour. Rev. J. B. M. Camm, yellow, flaked with red, good and useful; and Regularity (Keynes), variable, blush white, heavily striped with crimson, sometimes comes with a deep lilac ground, when it is very distinct—in either case a pretty Fancy, and to be depended upon for show purposes.

The foregoing lists, made up from notes taken at Messrs. Keynes & Co.'s nurseries at Salisbury, at blooming time in September last, may be useful to cultivators intending to make a selection. As it is customary to send out Dahlia plants from the nurseries in hampers, the plants being laid down on their sides and securely packed in soft moss, they should be put into a close frame as soon as received, and syringed or sprinkled overhead with soft water, and kept close for a day or two. As the plants are sent out in quite small pots, it will greatly assist them, and especially such as are intended to be grown on to supply blooms for early shows, if they are shifted into larger pots, so as to give the roots room to develop in. In this way fine and well-rooted plants can be had by the first week in June, and it is better and safer to grow the plants on into size in this way than to plant them out early and run the risk of having them cut down by frost in our somewhat uncertain climate: the second week in June will be found quite early enough to place the plants in the open ground with safety. R. D.

## Garden Operations.

### FLOWER GARDEN, ETC.

**BEDDING-OUT.**—The pressure of work in all departments of a garden at this season, when bedding-out must also be done, has to some extent given a "handle" to the opponents of it, on the ground of neglect of other work to the accomplishment of this; and whilst I grant the reasonableness of such a charge, I fail to observe its applicability to bedding-out alone, the same rule holding good through every phase of gardening. The fact is, that in nearly all gardens too much is expected from the means and assistance allowed, and so bedding-out forms a convenient hinge on which to hang all the delinquency for the neglect of other work, but with which it need not seriously interfere, if the work be undertaken piecemeal—that is, the hardy and half-hardy plants be got out, as opportunity offers, in April and early in May, the tender kinds following from May 20 to the end of the first week in June; the work is thus spread over a sufficient period to admit of leisurely planting, or, in other words, no other work need be delayed through attention to this. In our own case all the arrangements are completed, the beds marked out, the hardy plants planted, and the spaces reserved for tender kinds are labelled; but, however mild the weather may become, these will not be planted till the first week of June, when they may be expected to start into growth at once, whereas those that are turned out earlier run the risk of being crippled by cold, to their permanent injury. Meantime all should be hardened off by moving them to cold pits, and fully ventilating the same whenever the elements are propitious. The commoner kinds of "bedders," such as Verbenas, Ageratums, Calceolarias, and all kinds of Pelargoniums except tricolors, may now be planted. For massing, or colour grouping, Pelargoniums are still pre-eminent, and the variety is now so great as to satisfy the most fastidious—indeed, so great as to tempt those who are fond of this class of plants to use them too largely, by which the garden becomes monotonous, and lacking in interest because lacking in variety. If, through necessity, there must be a preponderance of Pelargoniums, or of any other kind of plants, much may be done to relieve the sameness and formality attendant thereon by the use of graceful foliaged plants as "sentinels," or "dot" plants, in the masses. The following are superb kinds of plants for this purpose:—the Australian Dracaenas, *Sonchus laciniatus*, *Acacia lophantha*, and *Grevillea robusta*. These are well suited for the least robust and lighter-coloured flowering Pelargoniums, and for the stronger growers and high-coloured kinds the following associate best:—the variegated and white and yellow-flowered Abutilons, Castor-oil plant, and *Solanum marginatum* and *pyracanthum*. This way of breaking the monotony of flat surfaces in all bedding arrangements, though little in itself, imparts a tone of grace and beauty to the whole garden, far beyond the value and number of plants required for the purpose. This mode of planting has, as it were, so become a part of our nature, that we find it impossible even to plant what are usually called "carpet arrangements" without working in the "sentinels." Of course, the appellation carpet is then no longer an appropriate

term, as no one thinks of a carpet being so uneven as to cause one to stumble over the figures in it. I prefer, therefore, to apply to it the term "embossed bedding," and for these arrangements, the bulk of the plants generally consists of low growing Sedums, Saxifrages, Cerastiums, Mesembryanthemums, Pyrethrums, and Alternantheras; the dot or central plants consist of small Dracaenas, *Chamepuce diacantha*, *Abutilon Darwinii variegatum*, and tall succulents such as *Sempervivum arboreum variegatum*, *S. Hendersonii*, *S. phyllioides*, *Echeveria metallica*, *E. glauca metallica*, *Pachyphytons*, *Cotyledons*, and other large succulents. It will readily be perceived, that much more interest attaches to beds of this class, containing such a variety of plants, than to those containing only the usual surfeit of *Pyrethrum Golden Feather*, *Alternantheras*, and *Echeveria secunda glauca*. The same rule should be followed in the arranging of succulent beds, the dwarfier varieties doing duty as a groundwork, the taller as standards, and there is then no danger of the beds presenting a rigidly formal aspect.

**GENERAL WORK.**—This now consists in hardening off bedding plants, potting on sub-tropicals, pricking out Asters, Stocks, Zinnias, Everlastings, Phlox Drummondii, Delphiniums, &c., and thinning out the common annuals that were sown in the open ground. *Alternantheras* may still be propagated: the dung-bed plan of striking them is every way the most preferable—our finest plants of last year were propagated in this manner as late as June 1. This is a good time to put in cuttings of various spring-flowering plants, such as double Wallflowers and Iberis—they strike best under hand-lights placed in a shady spot. Most kinds of spring flowers increase best by division as soon as they are out of flower. Among those amenable to this mode of propagation and requiring present attention are Daisies, dwarf-growing Phloxes, Polyanthuses, double Primroses, Arabis, *Aubrietias* and *Alyssums*. A border with a north aspect is the most suitable place for them, and they should be planted in rows 1 foot apart, and from 4 to 6 inches apart in the row. Well water them as soon as first planted, and after that, unless the season prove exceptionally dry, no further watering will be requisite. Hoe mixed flower borders and beds, not only to prevent the growth of weeds but to promote healthy growth in the plants. Vacant spots in such borders can be filled in by planting out Wallflowers, Sweet Williams, Asters, Stocks, or by sowing Mignonette, Virginian Stock, Candytuft, &c. Trim Box edgings and keep turf edgings closely shorn. When these are neglected the grass quickly seeds, and weedy walks are a certainty. Clean, dry, well consolidated walks, and a well kept lawn, are indispensable to full garden enjoyment. W. Whit Smith, Heckfield.

### HARDY FRUIT GARDEN.

Fortunately for the prospects of such a crop of hardy fruits as can reasonably be hoped for, the weather, which threatened to be fatal to everything tender towards the end of last month, only lasted a brief time, and with the exception of Strawberries no other crop seems to have sustained any material injury. The Strawberries were just opening their first flowers, every one of which (with us) turned quite black, and these of course are useless, still there will be no lack of quantity, although the loss of the finest fruit will be a disappointment to many. There is every sign of a long period of drought having set in, and where mulching between the lines has not yet been attended to, not a day should be put off in rendering this valuable aid to the roots of the plants. The material used at this advanced period of the season should be as clean as possible; or, at all events, it should be of such a composition that, after a heavy shower or two, or a good watering, there will be a clean surface left for the fruits to rest upon when they are ripe. The first batch of forced plants that we planted out for autumn fruiting—notwithstanding every care in planting—have suffered from dryness in the ball, both bodies of soil not having taken the water in alike. The balls have been pricked round with a handfork, and then thoroughly drenched with water, and the surface of the soil has been heavily mulched with short rotten dung, and another copious drenching given to wash the substance of the manure into the soil. It is noteworthy that standard Apple trees on the old-fashioned bush system are more prolific of blossom than their dwarf-trained congeners. Towering up to the stars with a larger area for the distribution of sap to expand itself, the branches and young shoots are of moderate size, and no doubt were in a better position for enjoying the full advantage of what little sun and dry air was vouchsafed to us last year. Pears will be a scarce crop if every flower sets, which is too much to expect from the fragile appearance of many of the trusses of blossoms. Cherries, which set an enormous crop, are losing heavily as they approach the stoning period, a circumstance which I anticipated some time ago. The rainfall has been so very slight during the past six months that wall trees generally will require to undergo a minute inspection at their roots, in order

that they may be supplied with sufficient moisture where that important element is deficient. Early trees in a forward state upon south walls may require immediate attention in this respect, and after they are thoroughly soaked at the roots a thick mulching of litter from 3 to 4 inches deep should be scattered over the surface of the border within a radius of from 3 to 4 feet of the stem of the tree. There is a narrow border and path, each 18 inches wide, all round our walls here, and we are having the latter pricked upon the surface about an inch deep with a five-pronged fork, and then covered with a layer of rotten dung. It is as well to be prepared for the worst, and to retain what moisture there is in the soil rather than have to supply it by artificial means if the drought continues. Caterpillars are growing troublesome upon Apricots and Cherries, and are hand-picked morning and evening. Disbudding, pinching, and thinning out of superfluous shoots in Peaches, Apricots, Plums, &c., and the destruction of insect pests will demand vigorous attention for some time if good health and fertility are to be encouraged and promoted from the beginning of the season, the most important time of all the year to institute a regular system of cultivation. *W. Hinds, Canford Manor.*

#### FRUIT HOUSES.

PEACHES AND NECTARINES.—The scarcity of this fruit on the open walls will be felt in many places this autumn, so that where there is a heavy demand for large desserts, arrangements should be made for meeting the deficiency by retarding late houses and wall cases through the early stages of growth in preference to shading when the fruit is ripe. If taken in hand early the best mid-season Peaches may be kept until September; but it will be necessary to throw open all doors and ventilators as the season advances, to keep the floors moistened with cold water, and to mulch the roots with good rotten manure in cases of poverty, and something less stimulating where the trees are making vigorous growth or carrying light crops of fruit. For giving the latest crop, such kinds as Barrington, Walburton Late Admirable, Téton de Venus, Prince of Wales, one of the very best of Peaches, and one or two of the yellow-fleshed varieties, together with Victoria, Stanwick, Elrage, Albert Victor, and Pitmaston Orange Nectarines are well adapted, but they should have the run of inside and outside borders with a flow and return pipe for protecting the blossoms from frost and damp in the spring, and to insure the ripening of the wood in the autumn. The pale puny-flowered, but magnificently fruited Walburton Admirable is a strong grower and shy setter, and on this account it should be grown in a sound but not over-rich soil, with plenty of warmth for ripening the flowering wood. The borders should be well drained, freely watered through the growing season, and free pollen producing kinds such as the Royal George Peach or Elrage Nectarine should be grown in the same house. Proceed with the usual routine in succession-houses, and keep the trees in health and vigour by the timely application of water to the roots and foliage, early ventilation, and good mulching. If red-spider or scale break out, as they often do near the pipes, soap and sulphur or Gishurst Compound applied to the foliage with a soft brush will speedily destroy the spider, and its application to the wood with a hard one will remove the scale, provided it is taken in hand before it reaches the foliage. In the management of forcing-houses of all kinds the appearance of the first insect should always be the signal for battle, when the moderate use of insecticides would prevent injury from their rapid spread and destruction of fruit and leaves. As before directed, allow a free growth of wood throughout the stoning period and guard against retaining more shoots than can be tied in to the trellis. As the fruit in the early house approaches ripeness, more air with a gradual diminution in the supply of moisture combined with gentle warmth in the pipes, will insure colour and good flavour. Observe great care in the removal of Peaches from the trees, as the slightest pressure of the fingers discolours the fruit; and be guided by the purpose for which they are intended in allowing them to hang until they are nearly ripe, or otherwise, as a Peach that hangs until it is quite ripe is past its best for eating, and it is almost useless for market purposes. *W. Coleman, Eastnor.*

#### MELONS.

Plants which have been raised for planting in succession to Potatoes, as the pits and frames in which the latter have been grown become vacant, should be planted at once. In some cases it may be necessary to turn over the leaves and add some fresh ones to raise the bed on which the Melons are to be grown to the required distance from the glass, allowing a few inches for the subsiding of the leaves, which should be firmly trodden together at the time of putting them in the pit. This done, 2 inches of rotten dung should be spread over the leaves, after which a couple of barrow-loads of soil of the same description as recommended in our Melon Calendar

for April 17 can be put in the centre of each light to form the hillocks; when this has been in the frame a couple of days it will be in a fit state to receive the plants without any apprehension of the temperature of the soil being lower than that in which the plants are growing or being in the least likely to chill their roots. The plants having been well watered the previous afternoon should have the soil pressed firmly around them in planting, and, should the sun be bright at the time, shaded for a few hours daily for a few days until they have re-established themselves; after which it may be discontinued altogether, for, as all of our practical readers are well aware, the Melon is a sun-loving plant. Where the beds are sufficiently near to the glass without the addition of fresh leaves it will be only necessary to remove a portion of the soil in which the Potatoes had been grown along the centre of the bed to make room for that prepared for the reception of the Melons. Put air on early in the morning, say at half-past 7 or 8 o'clock, according to the aspect of the pits, to prevent the foliage being scorched by the sun shining on them whilst the leaves are covered with moisture. Half-past 3 o'clock on bright days will now be soon enough to shut up, varying a little according to the aspect of the houses, pits, and frames. Another batch of plants should now be raised to plant in frames, which will be shortly vacated by bedding and other plants. *H. W. Ward, Longford Castle.*

#### CUCUMBERS.

Where these are growing in houses and hot-water pits the plants should be syringed twice a day both ways, so that every portion of the foliage may receive a thorough washing, which will be the means of keeping the plants free from the attacks of spider and other troublesome insects. Once a day during bright weather, and not at all on dull days, will be often enough to syringe those growing in dung-frames. Give liberal and frequent waterings of liquid manure at a temperature of from 75° to 80° to plants in full bearing, and avoid overcropping. If grown in frames, and straight fine-looking fruits are aimed at, the fruit should be placed in glasses as soon as they have set. Failing these, three strips of board nailed together will make a good substitute. The necessary stopping, thinning, and tying of the shoots will also require attention. Reduce fire-heat to a minimum with a corresponding decrease in the atmospheric moisture of the houses. If necessary, make another planting, so that the supply of fruit may exceed rather than prove unequal to the demand for the same. *H. W. Ward, Longford Castle.*

#### PLANT HOUSES.

STOVES.—The rapid growth most occupants of these structures are now making will necessitate a free use of the water-pot, as not only must none of them be allowed to become dry at the root, but the atmosphere must be kept in a constantly moist healthy condition. This may be done by frequently damping the pathways or flooring, the under parts of the staging and walls, from whence it will be gradually absorbed or taken up by the air and carried on to the great comfort and benefit of the foliage. At closing time in the afternoon and early in the mornings of bright days, a thorough syringing should be given so as to wet well the under and upper side of every leaf, as it is only in this way that those formidable pests to stove plants, thrips and red-spider, can be kept down and subdued, unless it be by the more tedious process of handwashing, a labour which the syringing, if judiciously used, in a great measure saves. That queen of climbers, *Bougainvillea speciosa*, will in most places, ere this appears, have shed its lovely inflorescence, and should be well thinned out in order to allow plenty of room for the young growth to be laid in, that it may have full and free exposure to light, sun, and air, which are essential to consolidate and ripen the same, and without thorough maturity it is a plant that is very shy-blooming. Restriction at the root is one of the best means of correcting an undue tendency to growth; and later on, by withholding water, the ripening process can be accelerated at pleasure, as then it is quite under control. The wood this *Bougainvillea* flowers freest on is that about the size of a small straw, which should be left at full length, and all of a gross character either be stopped or cut clean out directly it shows, as then the strength of the plant becomes more regularly distributed.

The summer blooming species, so useful for pot culture for exhibition purposes and conservatory decoration, needs thinning in like manner, and to insure a good display of its beautiful mauve-coloured bracts must have full exposure and a fair share of air to keep the young shoots short-jointed and firm, in which condition they will be found to flower with great freedom. As the plants advance and fill their pots with roots they should be liberally supplied with weak liquid manure, which may be continued with great advantage till it is time to begin to ripen them off in the autumn. In a general way *Bougainvillea glabra* is kept in too much heat, whereby the growth it makes becomes elongated, but in an intermediate

house the character is altogether different, and the plants being hardier are more serviceable for carrying about. It often happens at this time of year that stoves become much crowded owing to the multiplicity of things being now worked up for winter blooming, but with a change in the weather from the cold we are now having most of these may be accommodated in pits or frames that are deep enough to hold a little fermenting material, which to fresh-potted stuff is a great help in giving a start. Plunged in this, such subjects as *Sericographis Gliesbreghtii*, *Thysanacthus rutilans*, *Plumbago rosea*, *Justicia flavicoma*, *Euphorbia jacquiniiflora*, and others of that class, do remarkably well, and may be treated together, but one of the most useful of all plants for winter flowering, the *Linum trigynum*, should have a light to itself, as it is only by repeated and heavy syringing that it can be kept free from spider, a pest to which it is very subject, and one which quickly damages the foliage. In potting the *Linum* nothing suits so well as peat and finely-sifted leaf-mould with plenty of sand mixed, as in this the roots ramify freely, and water, of which it requires large quantities, passes readily through.

Bouvardias, too, are just at home in a dung frame, where they can either be planted out or plunged in pots, the former being the best, as giving the least trouble, besides which they grow more satisfactorily, and can easily be taken up in the autumn. Bouvardias, like *Linum*, delight in light rich vegetable soil, and if accommodated with 6 inches or so of similar material on the bed of tan or other fermenting material they may have, there will be no difficulty in growing fine little bushes that will yield plenty of flowers for cutting. To have them in this desirable state all that is necessary during the summer is to keep them properly supplied with water, and to shut up early after a good syringing; but as they are subject to aphid they must be watched and fumigated or dusted with tobacco-powder to prevent the points of the shoots from becoming crippled, and thus stopping their progress. Besides the plants enumerated above that succeed well under frame culture, there are the *Amaryllis*, for which no better place can be found; and if these are plunged in a tan bed where their roots can feel a little warmth and their heads be left exposed to the full influence of the sun, it is astonishing how greatly superior in flowering qualities such are over others that are smothered up in a stove, as when so unfavourably situated it is impossible for the bulbs to ripen off properly, and unless they can do this and be well cared for after blooming, previous to drying them off, instead of being large and plump like a matured Onion they will be found shrunken and without the power to emit blossoms when the season comes round. The thing now is, by means of judicious watering and the treatment referred to, to preserve the leaves in health till they have carried out their allotted functions, when, the natural process having been gone through, the plants cast them off as being no longer of use.

While giving due consideration to these winter and spring flowering subjects, others required for summer decoration must not be forgotten, and among these none are more useful or showy than some of the old-fashioned annuals, such as *Celosias*, *Balsams*, *Gomphrenas*, *Martynia fragrans*, and *Ipomoeas*, which, if sown at once and grown on, will soon be available for assisting to brighten up either conservatory or greenhouse. *J. Sheppard, Woolverstone.*

THE GARDENS OF KAMPEN. — "S. H." writes in the *Gardeners' Magazine*:—"The town of Kampen, the home at one time of that most eminent of the Cellebroeders, Thomas à Kempis, author of the book that must rank second to the New Testament in preciousness, is a town of gardens, and a place to which students of town gardening should make patient pilgrimage. In common with many other Continental towns that have been strongly fortified, the sword has in a certain way been beaten into a ploughshare by the simple process of converting the ramparts into flowery terraces, and the camping grounds into delightful parks. Nowhere in Noord Holland have we a more agreeable example of the advantages to a town of disused fortifications; for, being of made earth, and of varying levels, they very readily fit into the notions of an elastic-minded garden architect, but they favour the growth of many kinds of trees and shrubs that are as aliens in the district. Here, amidst the drenching vapours of the Zuyder Zee, where an artist's eye may have a perpetual feast of vaporous colouring, many of the fine trees that adorn Kampen would not live in the common soil on the natural level, but are seen to thrive on the mounds and the terraces of the embankments that in the 'days of old' were designed for defences. The Cellebroeders Poort, one of the sweetest architectural 'bits' in Kampen, adorns one of the most lovely gardens, and illustrates the indissolubility of the sister arts of Architecture and Horticulture, every good building needing green grass and waving trees to set off its beauty."

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	May 17	Popular Flower Show at South Kensington Royal Botanic Society's Show at Regent's Park.
WEDNESDAY,	May 19	Sale of Orchids and Specimen Stove and Greenhouse Plants, at Stevens' Rooms. Sale of Stove, Greenhouse, and Bedding Plants, at Park House, Catford, by Frotheroe & Morris.
THURSDAY,	May 20	Royal Horticultural Society of Ireland Spring Show. Reading Horticultural Society's Spring Show. Sale of the Collection of Orchids formed by the late J. E. Cockerel, Esq., at Stevens' Rooms.
FRIDAY,	May 21	Sale of <i>Phalenopsis grandiflora</i> , just imported from Borneo, at Stevens' Rooms.

TWO remarkable papers have been read within the last week or two before two different Societies, but both of them unfortunately of such length that it is quite impossible for us to reproduce them in their entirety, but to which, nevertheless, it is desirable to call special attention. The one is the paper by Mr. W. T. THISELTON DYER, Assistant-Director, Royal Gardens, Kew, on the "Botanical Enterprise of the Empire," read before the Royal Colonial Institute; the other is the record of "Forty Years' Agricultural Experience," by Mr. J. CHALMERS MORTON, read before the Society of Arts. The papers in question are, or will be, published *in extenso* in the *Journals* of the respective Societies. Mr. MORTON'S paper, moreover, is published in the *Agricultural Gazette* of last week. We may be excused, therefore, for not reprinting the whole of either of them, while our duty to our readers and our obligations to the science and practice of cultivation impel us to call the special attention of our readers to both of them, the one as bearing on Colonial, the other on home agriculture and gardening.

Alluding first of all to Mr. DYER'S paper, as being of the two the one in which, if there is any difference, we are most closely concerned in these pages, we may say that Mr. DYER'S aim was to give a "straightforward account of the work that is done or attempted to be done at Kew." Readers of the *Gardeners' Chronicle* will not need to be told that the decorative aspect of Kew—the gratification of pleasure seekers—is not the primary object of Kew, although it forms very properly a very important element in the management of that vast establishment. The history of botanic gardens in general, and of Kew in particular, may be assumed to be pretty well known to readers of the *Gardeners' Chronicle*, or at any rate, they have ample means of gaining information on these points. For these reasons we shall pass over the historical portion of the subject, and shall not tarry to speak of what is done at Kew in the home department, as we may so call it, but shall draw attention more particularly to that part of the everyday work of Kew which is not known to the general public or to the ordinary visitor, but which we venture to say is really and truly the most important part of the whole, so far as the welfare of the nation and indeed of humanity at large is concerned. When the intelligent visitor gets an inkling of this his visits to the gardens will be endowed with a new interest, and one of a depth and importance of which previously he could have no idea. Mr. DYER had ample reason to dilate upon the splendid services which Kew has rendered to scientific botany, and not less reason to be proud of what has been done in the matter of the practical application of botany to the general welfare of mankind. The priceless services, gratuitous though they be, of Mr. BENTHAM, the value and utility of the Colonial

*Floras* prepared at Kew, the magnitude and completeness of the herbaria and of the museums, the ever-increasing bulk and variety of the correspondence carried on at Kew, are all points which it is needless to dwell upon in these columns, so often have we had occasion to refer to them. We cannot speak in too high terms of them, but they are, comparatively at any rate, well known. Less generally known, however, are the services rendered by the several Colonial botanic gardens (of which Kew may be taken as the head centre), and to which Mr. DYER very appropriately devoted a large share of his paper. Mr. DYER struck a note in which he is sure to have a sympathetic response, when he urged the propriety of making a botanic garden attractive as well as useful.

"To make a botanic garden, especially in the tropics [why especially in the tropics?], as dreary and formal as a city graveyard is a safe and certain way to bring botany and everything else connected with it into contempt. No man should be so much of a botanist as to lose in the contemplation of the structural interest of a fine plant all satisfaction in the charm or grace of its form. As a general rule we may safely expect to end by interesting people when we have begun by pleasing them."

Great knowledge of human nature, and strong good sense in those words. Passing on from this subject, Mr. DYER had an easy task when he dwelt upon the truly magnificent services to the human race which Kew, in association with the various botanical gardens of India and the colonies, has been able to perform. Food, raiment, shelter, fire—requisites alike of the untutored savage and the be-titled minister—all these are the subjects of unceasing care and attention on the part of the establishments to which we have referred. Luxury, refinement, and recreation, for which the general public in this country looks in this great establishment at Kew, in association with knowledge and utility are, in the Colonies, at any rate in the newer ones, secondary matters. The great thing there is to study the native vegetation—to see what it is capable of, to supply its deficiencies, to introduce the valuable plants of other countries—in other words, to develop their resources, intrinsic or extrinsic, to the utmost. In the case of the older countries botanical science and botanical practice have to repair and make good the waste and destruction which lust of gain and thoughtless destruction have brought about. These are grand objects, and for their fulfilment they require the science and the tact of a dozen Kews. Meanwhile, it is impossible not to recognise with thankfulness what has been done already so quietly and unobtrusively by the agencies we have mentioned. New industries have been created, new sources of wealth developed, pestilence and malaria effectively dealt with in their strongholds, barren hillsides clothed with forests, waste places made to smile with the rich products of vegetation. Great as is the task still before our botanists, our foresters, and our gardeners, it is impossible not to look with pride upon what has been done by our home authorities, and by our botanical and forest officials in India, in Australia—everywhere where the British flag floats. It would be as invidious as it is unnecessary to mention names, suffice it to say that the honour and credit for all this is due to Kew and to the garden and forest establishments all over the world which are in constant communication with it. This being so—and the facts are beyond dispute—it is a duty to impress upon our own general public, heedless of these things, and still more upon the Colonial public, the absolute necessity of an enlightened and liberal support. The counting of stamens, and the inquiry whether this leaf is hairy, or that smooth, may seem to the ignorant a mere matter of laborious trifling, but it may mean, as Mr. DYER had no difficulty in showing—it may mean a loss of thousands of pounds and years of valuable time

—it may mean heartburning and paralysing disappointments—or it may mean, on the other hand, splendid success and untold benefit to humanity.

How pitiful from this point of view appear the criticisms that this or that flower-bed is not so good as it might be, this or that shrubbery not so ornamental as it should be, this walk not quite planned according to the line of beauty, this or that garden not quite to the taste of the Governor, not quite in harmony with the views of the Town Councillors. In too many instances are the Colonial gardens cribbed, cabined, and confined by unappreciative authorities, starved by scanty means or diverted from their proper functions to serve only as recreation grounds or nursery establishments. Mr. DYER'S paper may be taken as a vigorous protest against this state of things, and we heartily wish it may have a good effect, by stirring up a feeling of confraternity and co-operation between the authorities in various Colonies, and between them all and Kew; and at the same time stimulate the powers that be to accord all reasonable facilities and means to these establishments, and induce the general public to look more appreciatively and sympathetically than they do on the quiet work of a most learned, laborious, and unobtrusive set of workers.

Adverting now, in the briefest terms, as we needs must, to Mr. MORTON'S paper before the Society of Arts, we may say, in general terms, that it was an epitome of the author's experience during the last forty years, crystallised and condensed into a series of diagrams and tables, so constructed that he who ran might, if he chose, read also. The record of Mr. MORTON'S many services, his, as we suppose, unexampled opportunities, was given with a straightforwardness and absence of self-laudation that were alike admirable. Brimful of facts, enlivened with forcible argument and lively illustration, this formed one of the most instructive and deeply-interesting lectures it has been our fortune to listen to. Now that the *Agricultural Gazette* has a separate existence apart from the *Gardeners' Chronicle*, our tongues and pens are no longer tied, and we rejoice in the opportunity of expressing our admiration of the honest, straightforward, and untiring zeal, the winning courtesy of our late colleague—still our friend and neighbour. No one who heard the lecture we are alluding to, and listened to its ample array of well-marshalled facts explained and commented on with *verve*, tact, and ability, will wonder that we, who have been privileged to know and to work with him for years, should feel proud to have been associated with such a man. We must refer to the *Agricultural Gazette* and to the *Journal of the Society of Arts* for the full details of this valuable paper, meanwhile we may say that its main object was to show the extreme fluctuations during the last forty years in all kinds of agricultural produce, to associate these fluctuations with varying climatal conditions, especially rainfall, variable in amount during the growing season. Fettered by ever-shifting antagonism of this character, the tenant-farmer, so ran Mr. MORTON'S argument, should be as unhampered and unrestricted by covenants and leases as possible. A good farmer unrestricted by vexatious covenants would make a better tenant than an indifferent one tied down by all sorts of restrictions. Mr. MORTON'S tables and results had great interest for us, inasmuch as it was obvious at a glance that what applied in the case of agricultural crops applied also to a large extent, making allowance for differing conditions and circumstances, to our market garden crops, our fruit and Potato crops, and our kitchen garden produce.

Mr. MORTON, as we have seen, dwelt principally on freedom of tenure and freedom from restriction as the means whereby the farmer

might fortify himself against the fluctuations of season and the competition of foreign growers. But there are other matters which strike us in looking at his tables, and which probably the time at his disposal forbid him to enter into, or at least which induced him to pass over lightly. For instance, an inspection of his tables shows that the fluctuations in the case of grazing farms and in the amount of dairy produce are considerably less violent

bear a series of adverse seasons. Adverse seasons! Can the farmer or the gardener help himself against untoward fate? A more profitable question would be—Does he try? Is he not too much inclined to look on such things as visitations of Providence rather than as difficulties to be provided for and contended against, so far as circumstances will allow? True, he drains and cultivates, but does he make provision against drought? Does he provide means

with whom no sooner is one crop off than another is in, and with whom if one crop fails another compensates for its loss by its productiveness. The farmer wants more labour-saving appliances, more machinery, more light, more heat, and let none say these latter are beyond his means till the attempt has been made to obtain them. The farmer, too, requires to bring his produce direct to the consumer, and to this end wants better and more rapid

FIG. 106.—CHOISYA TERNATA. FLOWERS IVORY-WHITE. (SEE P. 626.)

than in the case of arable farms, for reasons which are sufficiently obvious — one being that the pasture farm is more or less productive throughout the entire year and not during one short season only. Again, the tables show clearly, if we read them aright, the great advantage of large farms worked by large capital over small farms worked by relatively slender means. The more the capital, the greater the area dealt with, the greater the intelligence brought to bear in its management, the greater the returns, the greater the power to

for taking the water from where it is not wanted to where it might be useful? Does he utilise the resources at his command, or rather is he not guilty of wanton waste and ignorant misuse of manure? Too often, we fear, it is so, both with gardeners and farmers, though we must say we think the latter might well take a few lessons from the former. Then again the farmer depends far too much on one or two crops—he puts all his eggs into one basket. Compare his practice with that of the market gardener, for instance,

means of conveyance, less and less dependence on the middleman.

We cannot pursue the subject or give more illustrations, but we cite them merely to show that, in our opinion, freedom of tenure and of culture are by no means the only things a farmer or gardener requires in his conflict with the elements. He wants, so far as circumstances will permit, to use the forces of Nature, and make them do his bidding rather than be vanquished by them. Surely no one in the nineteenth century will say that a man is powerless in this

respect—all experience goes to the contrary. The farmers and the gardeners require to avail themselves of the forces already turned to such account by the engineer and the telegraph operators. What is possible to one class is surely in its degree and in its way possible to others.

— *CHOISYA FERNATA*.—In writing of this plant in 1869 we stated that this ornamental greenhouse shrub, though introduced some years since, is now very rarely met with. The same remark might be made now, though we may well anticipate that it will speedily make way when its merits become known. For ourselves, we first met with it in the *Jardin des Plantes* at Paris several years ago, and were struck with its beauty. For some years, too, the plant has been grown against a wall at Kew, as well as at Messrs. E. G. HENDERSON & SONS' nursery, and the fact that it is now in bloom there, with its deep green foliage quite uninjured, is a sufficient proof of its hardy character. As a greenhouse plant, and for early forcing purposes, few plants can vie with it, as many who saw Mr. B. S. WILLIAMS' specimens exhibited at recent shows will readily admit. The general character of the plant, a native of Mexico, is well shown in the accompanying engraving (fig. 106) of a spray from Mr. WILLIAMS' specimen; the flowers are in colour like those of the Orange, to which indeed our plant is nearly allied. As in the case with other plants with compound leaves, the segments are jointed to the leaf-stalk, so that the position and set of the leaves varies according to circumstances.

— *INDIAN AZALEAS*.—The Indian Azalea had a kind of field day at South Kensington on Tuesday last. Messrs. VEITCH & SONS set up a representative group, in which we found old and new varieties of merit, and being pleasantly interspersed with Japanese Maples, there was presented to view a bank, of colour, singularly attractive, while it was capable of being turned to excellent account as an instructive collection. Nothing could come near Flambeau for its lustrous purple-crimson colour. It stood out from all the rest, illumining the group with a breadth of tone as rich as its was pronounced. It is with Azaleas as with some other flowers, the richest hues of colour are found in association with blossom of inferior form. We want the crimson of Flambeau allied with the fine form of the glorious white Apollon. *Eclatante*, salmon-red, is very bright and striking, and an invaluable decorative variety. *Roi d'Hollande* is still a fine rich coloured variety, and Neptune is equally useful, but a little paler. *Cocarde Orange* is a very taking double variety, with orange and salmon-red flowers, very free. Among salmon shades the fine old *Stella* still takes high place, a little semi-double, fine in form, and with dashes of bright purple on the upper segments. *Adolphe Masquitter* is also very fine, with a dash of purple on the upper segments, but not so deep in colour as *Stella*. *Grandis* is well named, very large, of fine form, with dashes of purple on the orange-salmon. Of magenta shades, *Duc de Nassau* and *Charmer*, two varieties still almost unrivalled for exhibition purposes, are yet in the van of the group of this colour; *La Rose* is of a pale magenta-rose, large, very fine, free, and a most desirable decorative variety. *Cedo Nulli* is of a violet-magenta colour, pale, but very striking. *Oswald de Kerchove* is of a very bright rosy-magenta colour, and a most desirable variety. Of paler shades of rose, *Reine des Roses* takes high place—large and very pleasing; *Dr. Moore* is a double-flowered variety, and very free; *Comtesse de Flandres*, pinkish-rose, is very fine and free; and *Madame Van der Cruyssen* has double rose flowers, also very free. In the way of variegated Azaleas, having strongly marked white margins, *Madame Louise de Kerchove*, salmon edged with white, is very pretty and fine, as well as of excellent form; *Mr. Turner* is of a more delicate tone, but very good. Of white-flowered Azaleas there were several; a white *Roi Leopold* is remarkably free, inclined to become semi-double, and occasionally flaked with carmine-pink. *Pharailde Vervaeke* is a fine white, with large flowers having fringed petals, but very pleasing indeed because of its purity of colour. *Bernhard Andreas alba* is a pure white form of this double rose-coloured variety; *Rosa Bonheur* is also a good white semi-double, with dashes of pale green in the centre; *Marie Van Houtte* is pure

white, with slight flakes of carmine, and semi-double; *Leonie Van Houtte* is a very good white variety, with slight dashes of green; and *Apollon*, a grand Azalea, large and splendid in form, and occasionally striped with pale rose. There is no plant so valuable to gardeners generally at this season of the year as the Indian Azalea.

— *GIANT HERBACEOUS CALCEOLARIAS*.—This name might be appropriately applied to some herbaceous Calceolarias exhibited at South Kensington on Tuesday last by Mr. RAPLEY, gr. to J. BRAND, Esq., Bedford Hill House, Balham. The flowers were of enormous dimensions, some of them measuring 2 to 2½ inches in length and correspondingly broad. The plants were of a quite dwarf character, healthy, and are in a very sandy soil. The largest flowers were those having yellow grounds more or less spotted, and two or three self yellows were large and fine. While size must always be a telling point in herbaceous Calceolarias, both in respect of decorative purposes and the opinion of the general public, raisers of this flower, while gaining dimension, have not associated them with form: the large blossoms being "baggy," loose, and uncouth, with a very few exceptions. Of late years the Calceolaria has been dwarfed in its growth, strengthened in its habit, and increased in size; but in point of form the progress has not been so marked. Let our raisers take a new departure, and give us blossoms partaking of that symmetry and form that were closely associated with the Calceolaria when it was more of a florists' flower than it is in the present day.

— *NEW DECORATIVE PELARGONIUMS*.—Mr. R. WEATHERELL's group of these at South Kensington on the 11th inst. possessed one remarkable merit, that of dwarfness of habit. The plants were from 15 to 18 inches in height, and had large and full heads of bloom. *W. E. Gladstone* and *Clipper* are two very bright varieties, that looked 20 per cent. better in the conservatory than they did in the dark Council-chamber, which so often detracts from the value of really good things. *Brilliant*, *Success*, *Master Richard*, and *Vivid*, are all bright in appearance, and, in common with these decorative Pelargoniums, very free. Mr. BRAID's *Decorator*—which in common with *W. E. Gladstone* and *Clipper*, in the before-mentioned group, was awarded a First-class Certificate of Merit—was large and bold in appearance, but with a roughness of expression decidedly against it. A variety in this group, named *Vivid*, was of great value for its colour and form; and now there is such a large group of these useful Pelargoniums, we need here, as in the Calceolaria, improvements in form, and a more perfect outline of shape.

— *TRIANEA BOGOTENSIS*.—Mr. BURBIDGE kindly sends us flowering specimens of the curious *Trianea bogotensis*. It is a curious water plant, with the appearance of a gigantic Duckweed (*Lemna*), but the floating disc-like leaves are, as it were, threaded upon long runners, as in a Strawberry. The flowers show it to be allied, not to the *Lemna*, but to the common Frog-bit, *Hydrocharis*. It is a fit companion to the *Pistias* and *Pontederas* of our stove tanks, and would form a capital plant for drawing-room aquaria. During the past winter Mr. BURBIDGE had several plants in an intermediate-house which now and then descended to 38°. The honeycomb-like air-cells below the leaf cause it to float nicely on the water-level. Six inches of water is sufficient for it. A little loam surfaced with gravel serves for its roots to permeate in their quest after nourishment. Mr. BURBIDGE tells us that "he has *Trapa natans*, *Ceratopteris*, *Ouvirandra frenalistris*, *Herpestis*, *Nymphaea pygmaea*, *Azolla*, *Limnocharis*, *Aponogeton distachyon*, &c., now growing well in pots and pans of earth, the holes stopped up below, and the earth surfaced with water. *Pistia Stratiotes* and *Salvinia natans* we lost during the winter, and much desire to possess again."

— *CAUTION TO GARDENERS*.—A Buckinghamshire gardener writes:—"I wish to put gardeners on their guard against two men, passing as brothers, who are going about the country photographing gentlemen's mansions. As I, with many others in this neighbourhood, have been practised upon by these men, I write from experience and information since gained. Their method of proceeding is to take apartments in a town and get cards printed with their address (I enclose one). They then hire a horse and

trap and drive around to the various gentlemen's establishments in the locality, selecting those where a good staff of servants is likely to be kept indoors and out. They send their card in to the lady or gentleman at home, and ask permission to photograph the house, which is generally given, and afterwards pay a visit to the gardener, to induce him to make up a group of his men to be taken with the house, which many are willing to do, with the idea of getting a view of the house; but after ordering their photos and paying for them in advance they find that they have been the dupes of systematic swindlers."

— *ANOTHER SUBSTITUTE FOR HOPS*.—In Germany *Menyanthes trifoliata*, our beautiful Buckbean, is used as a substitute for Hops in brewing. The bitter principle is said to be present in greater abundance in this plant than in the Hop itself. In Sweden it is used in the brewing of porter, and is said to have been introduced into that country by an English sailor in 1789. For brewing purposes the leaves should be gathered in the spring, and dried in the shade.

— *HARDY HERBACEOUS PLANTS AT KEW*.—Several interesting hardy Primroses are now blooming at Kew. Perhaps the most handsome of all these is *P. sikkimensis*, which long ago was spoken of by Sir JOSEPH HOOKER as "the pride of all the alpine Primulas." The author of that charming book, *Journal of a Naturalist in the Himalayas*, found it in wet, boggy places at elevations of from 12,000 to 17,000 feet at Lachen and Lachong, covering acres with a yellow carpet in May and June. The tall scapes bear heads of pendulous almost bell-shaped, long-stalked, lemon-yellow flowers. An ally of this, a new species, *P. grandis*, lately received at Kew from Dr. REGEL, of St. Petersburg, is an extraordinary plant, with tufts of long-stalked, cordate, rugose, toothed, green leaves, and a stout scape bearing a large number of gracefully drooping, tubular yellow flowers not nearly so large or showy as in the last-named; the whole plant, with the exception of inflorescence, being devoid of meal. *P. luteola*, a Caucasian species, first discovered by RUPRECHT, belongs to a totally different section from the one just mentioned, and has salver-shaped corollas of a clear yellow colour. *P. involucrata* is a lovely plant; and, in addition to the beauty of the flowers, these possess the attraction of being deliciously scented. Two forms of this were noticeable at Kew—one with the ordinary creamy-white flowers and short styles, the other with reddish-purple corolla tubes and long styles. *P. purpurea*, a nearly scentless species, with its long narrow leaves, deep glossy green above and white beneath, and heads of rather large purple flowers, is very handsome; according to Dr. WATTS, however, who at present is busy at the Kew Herbarium on a monograph of the Primulaceae, the cultivated plants, fine as we think them, are very poor in comparison with the species in its Himalayan home. The earliest of all the *Præonies* at Kew is *P. anomala*, a pretty and graceful plant, about 2 feet high; it has splendid deep crimson blossoms and finely cut foliage. *P. tenuifolia*, from Tauria, with flowers about half the size of the last, has leaves almost Fennel-like in the fineness of their cutting, whilst in its variety *latifolia* they are much coarser, being very like those of *P. anomala*. The *Globe-flowers* are too showy to be passed over; they are amongst the best of spring border plants. *Trollius europæus*, *T. napelliformis*, and *T. altaicus*, have fine lemon-yellow flowers. In the Siberian *T. asiaticus* they are orange-yellow, whilst in *T. Fortunei* the orange is so deep as to be tinged with red. *Thermopsis flexuosa*, with its digitately trifoliolate-stalked leaves, with large stipules and large Pea-shaped yellow blossoms, is a useful and ornamental border plant, about a foot and a-half high.

— *SCOTTISH HORTICULTURAL ASSOCIATION*.—The Association has agreed to offer prizes of £5 for the best, and £2 10s. for the second best, essay on "The History of Horticultural Buildings," special reference being made to the development of designing, heating, ventilating, and arrangement, with illustrations. The competition is open to all members of the Association. Also prizes of £3, £2, and £1, for competition by under-gardeners, members of the Association, for the three best "Collections of Insects Destructive to Plant Life," with short descriptive notes; and similar amounts for competition by under-gardeners, members of the Association, excluding

previous prize winners, for the best three herbaria of British plants, collected between April, 1880, and February, 1881. The collections to be arranged according to the natural system. The name of each plant, its habitat, and date of collection, to be stated on the paper on which the specimen is preserved. Essays, collections of insects, and herbaria, to be sent to the secretary, Mr. ALEXANDER MILNE, Leith Walk Nursery, Edinburgh, carriage paid, on or before February 1, 1881, under motto, and accompanied with sealed envelope containing sender's name, address, and motto, with a written declaration to the effect that each competitor has, as the case may be, written the essay, collected the insects, and gathered the plants, in the collection, in the localities mentioned, within the stated period.

— **CARISSA GRANDIFLORA.**—In the Palm-house at Kew a fine specimen of this beautiful evergreen shrub is in fine flower, its large deliciously scented pure white blossoms contrast well with the deep green glossy leaves. A native of the Cape of Good Hope, from whence it was introduced by COOPER, when collecting for the late Mr. WILSON SAUNDERS.

— **JAPANESE PLANTS AND SPRING FROSTS.**—

The Rev. C. WOLLEY DOD writes:—"There certainly cannot be such things as east winds or spring frosts in China or Japan. If a plant is named japonica, or Sieboldi, or Fortunei, I at once know that it will stand any amount of cold in winter, but not frost or east wind in spring. *Dielytra spectabilis* is shrivelled up to nothing; *Spiraea japonica*, out-of-doors, is cut to the ground; *Spiraea palmata* has its blooming shoots hopelessly spoilt. *Polygonum Sieboldi*, which was 4 feet high in the woods, is doubled up with its top to the ground. Many true alpine seem to enjoy the dry cold. *Gentiana acaulis* appears to thrive on it: a lovely plant which I now have in full flower for the first time, *Anemone narcissiflora*, bears it bravely. Of the Globe-flowers, too, *Trollius europæus*, *asiaticus* and *americanus* are finer than I ever saw them, but the dark orange-flowered kind known as japonicus, or Fortunei, hangs down its head and is withered. A plant with a mass of feathery, elegant white flowers, like a delicate Dropwort, is very ornamental now, and is certainly not Japanese, though I do not know its nationality. It is named *Heuchera botryoides*. Spring flowers which do not mind an English east wind are worthy of being honourably mentioned."

— **ORCHIDS IN FLOWER AT KEW.**—*Thunia alba*, of which there are some nice well-grown examples, is a handsome plant, striking alike by reason of its fine Sugar-cane like foliage, and its large showy flowers; pure white, with the exception of the lip, which shades off into canary-yellow in its lower portion, and is veined with purplish lines in the upper. *Physisiphon Loddigesii*, though not strictly beautiful, is a graceful and elegant plant of *Pleurothallis*-like habit, and long one-sided slender spikes of rather distant, small tubular flowers, which are yellow-green in lower half, and deep red-orange above. *Brassavola Digbyana*, a very singular Orchid, is remarkable for its fragrant, very large, solitary flowers; its elongated stem-like pseudobulbs are terminated by a thick glaucous leaf, from the base of which rises the peduncle. The sepals and petals are a pale purplish-green, and the creamy-coloured cordate lip is extremely large, its margin being cut up all round into a dense hair-like fringe, nearly an inch in depth. *Epidendrum selligerum*, though deficient in coloration—the sepals and petals being a dull olive-green, and the three-lobed lip white—deserves to be grown for its delicious scent; it is an easily cultivated free-flowering species. A fine variety of *Cattleya Warneri*, with deep purplish-crimson lip, makes a fine display, as do also some good *Vandas*—*V. insignis*, *V. tricolor*, and *V. suavis*.

— **THE COOMBES.**—The Coombes in the parish of Sibbertoft, on the border of Leicestershire, are a peculiar feature as occurring in the county of Northampton. Occasionally they are nearly precipitous, and everywhere form a distinct transition for some miles from the upper to the lower lias, consisting of marlstone. The object of mentioning them here is to call attention to a circumstance which was brought before my notice yesterday. A patch of about 18 feet square was covered with varieties of the Cowslip, many of them of great beauty. Of those before me

one has the ordinary Cowslip tint, the petals terminated with bright crimson; the flowers in different specimens were pin-eyed and thrum-eyed. Another, still of a Cowslip form, had petals as broad as those of the Oxlip, but still with the Cowslip character, of a bright orange, and very beautiful. These flowers were pin-eyed. A distinct and very handsome plant, with bright crimson petals, with a yellow disc and a yellow line up each petal, had the habit of a Primrose: in this the pistil projected very far, the flower-stalks very slender and hispid. From the same root sprang a large-flowered orange Cowslip. Doubtless other forms would have been found had they been sought for. The party consisted of school children with their teachers, who accompanied them; all the children with one accord said that the plants must have been accidentally turned over, for they had found that, if a Primrose or Cowslip was planted with the head downwards, it invariably produced coloured flowers, and they could not be persuaded to the contrary. Several of the plants were growing on old Ash stumps, which were scattered over the whole plot. *M. J. B.*

— **THE FIVE-GALLON MEASURE.**—The *Gazette* of Friday, May 7, contains an Order in Council to the effect that HER MAJESTY is pleased to approve of the "five-gallon measure" as a new denomination of standard, and directs that the same shall be a Board of Trade standard in like manner as if it was mentioned in the second schedule to the Weights and Measures Act, 1878.

— **SCOTTISH HORTICULTURAL ASSOCIATION.**

—The subjects of the papers to be read and discussed at the meetings of this Association during the remainder of the present session are:—June 1. "Florists' Flowers: Past and Present," by Mr. John Downie; "Flowering Stove Exotics," by Mr. A. Fischer. July 6. "The Fruit and Flower-producing Agencies of Fibrous Roots," by Mr. M. Temple; "Phalænopsis," by Mr. Wm. Russell. August 3. "Arrangement of Flowers in a Bouquet," by Mr. A. Kerr; "Botanical Tour through the Himalayas," by Mr. Wm. Gollen. September 7. "Planting and Distribution of Trees, with a view to Landscape Effect," by Mr. C. S. France; "Hardy and Exotic Ferns," by Mr. Chas. Warwick. October 5. "Fruits in Lanarkshire," by Mr. Jas. Whitton; "Pine-apple," by Mr. Chas. Buchanan. November 2. "Vegetation of Past Epochs," by Mr. J. Newton Burns; "Chinese Azaleas, with special reference to Early Forcing," by Mr. Alex. Mackenzie. December 7. "The Chemistry of Plants," by Mr. W. I. Macadam. 1881.—January 4. "Calanthe Culture," by Mr. Wm. Priest; "Ferns and Selaginellas," by Mr. Wm. Dickson. February 1. "Orchids," by Dr. Paterson; "Plant Physiology," by Mr. John Sadler.

— **MATRICARIA INODORA FLORE PLENO.**—

This plant is evidently identical with what has been sent from the Continent as a *Chrysanthemum*. It differs, however, entirely from that family of annuals, as it is a very hardy biennial, if not perennial. One of its features is found in its usefulness as a winter decorative plant for the border. The foliage is dense green, Fennel-like, and covers the ground well, making charming tufts of greenery when nearly all else is withered and brown. The flowers, which are produced in great abundance during the summer and autumn, are full, pure white, have long stems, and make capital material to furnish cut flowers. The plant is quite devoid of the customary Feverfew perfume.

— **THE METEOROLOGICAL SOCIETY.**—At the ordinary meeting of the Society, to be held at 25, Great George Street, Westminster, on Wednesday, the 19th inst., at 7 P.M., the following papers will be read:—"Variations in the Barometric Weight of the Lower Atmospheric Strata in India," by Prof. E. DOUGLAS ARCHIBALD, M.A., F.M.S.; "Winds and Weather experienced in the North Atlantic, between lats. 30° and 50° during February and March, 1880," by CHARLES HARDING, F.M.S.; "On the Meteorology of Mozambique, Tihoot, for the year 1879," by CHARLES N. PEARSON, F.M.S. For exhibition:—the Radiometer invented by D. WINSTANLEY.

— **THE VOCABULARY OF BOTANICAL TERMS.**—At the last meeting of the Linnean Society (May 6), Mr. G. T. BETTANY, of Guy's Hospital Medical

School, gave some remarks on the vocabulary of botanical terms in use in the description of flowering plants. The author advocated making a distinction between terms used in elementary descriptions in educational works and those used in the terse and complete Floras. Under evolution there was much chance of botanical progress if terms were simplified and made such as children could comprehend; but almost every book aiming at comprehensiveness became obscure. For these and other reasons the author strongly objected to the now too frequent use of tri and polysyllabic terms.

— **AGATHIEA CELESTIS FOL. VARIEGATUS.**—A market grower finds this a very remunerative plant to grow for sale in August and September to visitors who are attracted to his nursery. Originally introduced as a bedding plant, it failed to fulfil the first promise of usefulness, and then it was thrown aside by many as a failure. Some, however, discerned in it a useful subject for pot-culture for house decoration; and growing it on into size, and getting it well established in 5-inch pots, were delighted with its freedom of bloom, its profuseness and continuity, its neat Box-like white variegated leaves, and its compact, short-jointed, wiry habit of growth. It has this further recommendation, that it produces very pretty silvery mauve-blue flowers that are thrown well above the foliage, and it is this which makes it so attractive. Those who see it buy it; and, it being a plant that will bear a large amount of cold, as well as rough treatment. If kept watered it remains for a long time in flower. It deserves far more attention as a window plant than has yet been given to it.

— **POTATO FLOUR.**—In the last number of the *Monthly Magazine of Pharmacy* attention is drawn to the fact of the very great demand there is for Potato flour, the extent of which, it is said, is almost unlimited. This flour is simply the dry evaporated pulp of the common Potato. The whiter, and more free from black specks, the better, of course, is the quality. It is used for sizing and other manufacturing purposes, and by precipitation, and with the aid of acid, is turned into starch. In Europe it meets with a large and increasing demand in its primitive state as Potato flour. In Lancashire alone 20,000 tons are sold annually, and as many more would be taken if put on the market. When calcined it is used largely for silk dressing, as well as for other purposes. At present the quotation for Potato flour in Liverpool is nearly double that of Wheat flour.

— **DEUTZIA GRACILIS.**—We have just seen some plants of *Deutzia gracilis* that were bloomed in pots last spring, and grown on all the summer in a cold greenhouse, and suffered to flower again this spring without a shift. From the time they began to grow they were treated three times a week to a surface-dressing of Clay's Fertiliser, and they are now completely covered with dense heads of very fine flowers. As a matter of course they receive close attention in regard to water at the roots.

— **EFFECT OF SCION ON STOCK.**—Mr. D. T. FISHER kindly sends us a specimen which may be described in his own words:—"We have here a fine Purple Beech grafted about 4 feet from the ground. At the base of the bole there has sprung up a tuft of shoots with copper-coloured leaves, of which I enclose samples. Fifteen feet from the bole there is another similar tuft. These are later and shorter growths. Both are somewhat in advance of the tree itself. Is not this singular? And both have also more colour than the growing branchlets of the tree. Is not this yet more marvellous?" This adds another and an interesting example to the few cases recorded of the influence of the scion on the stock, as mentioned in Dr. MASTERS' article on the subject in our volume for 1872.

— **PRIZES FOR ORCHIDS.**—The Hon. and Rev. J. T. BOSCAWEN, Steward of the Horticultural Department of the Bath and West of England Society's forthcoming show at Worcester, requests us to state that he will again give at that meeting two cups of the value of 10 guineas and one of 5 guineas for Orchids. Amateur Orchid growers should make a note of this, and write to Mr. BOSCAWEN for particulars.

— **THE LINNEAN SOCIETY.**—The two following *savans* have recently (May 6) been elected Foreign Members of the Linnean Society:—M. C. J. DE

MAXIMOWICZ, Director of the Imperial Museum and Herbarium, St. Petersburg, well known for his numerous memoirs on systematic botany; and Dr. EDWARD STRASBURGER, Professor of Botany in the University of Jena, whose morphological and physiological researches on various groups of plants are highly appreciated.

— PUBLICATIONS RECEIVED.—*Natural History Rambles: Ponds and Ditches*, by M. A. COOKE, LL.D. (Society for Promoting Christian Knowledge).—*Revue Scientifique.—Introduction to the Study of Flowers*, by ANDREW WILSON, Ph.D. (Chambers).—*An Elementary Text-book of Botany*, by Dr. PRAUTL, English translation, revised by Dr. VNER (SWAN, SONNENSCHNEIN & ALLAN).—*The Art of Growing Roses Out-of-doors*, by the Rev. O. FISHER, 4th edition (BRADBURY, AGNEW & CO.).

— ARISTOLOCHIA GOLDIEANA.—We are pleased to hear that this magnificent species, from West Africa, is coming into flower at Kew. It was figured in the *Gardeners' Chronicle* in 1867.

— SOCOTRA—THE PHYLLOXERA.—We are indebted to Professor BAYLEY BALFOUR for the following interesting note relating to his recent experiences:—"I collected at Socotra specimens to bring home alive of succulents, such as *Stapelia*, *Euphorbia*, *Adenium*, *Aloe*, &c., and also bulbs of several Monocotyledons. The larger specimens I packed in cases, addressed them to Kew, and sent them as freight by P. and O. steamer. But fearing that accident might befall these cases, I took out one or two specimens of each species (all small ones), which I put in a Pandanus-leaf basket and took with me on board the steamer to bring home direct overland. All went well until I reached Brindisi. When I landed there I was very weak from fever, and not at all in a mood to make a row at the Custom-house. All my gear was taken there, I myself carrying my plants—the basket being tied across, so that they were covered. My portmanteau and other things were passed by the customs officer and I was just leaving the place with my basket when a *gendarme* shoved his hand in at one end of the basket and seized the end of a *Euphorbia* stem which happened slightly to project. I was instantly ordered back, and notwithstanding all my protestations as to the scientific value of the plants, I was told they could not be allowed to go through Italy, and I had farther to submit to my other packages being opened and searched for any stray plant, although they had been before that passed. I said I should take the plants to the P. and O. office and have them properly forwarded to England. No! that could be not allowed; and I was marched, guarded by a *gendarme*, back to the ship. All I could do then was to hand over my package to the head steward, with instructions to have the plants properly packed for transmission by Southampton, but as the steamer had first to go to Venice and the box would have to go back to Port Said, it will be some time ere it reaches this country. I am greatly vexed about this, for in my anxiety to get the plants home alive I had put all my most important things into this basket. In some cases I only had one or two bulbs of a plant, and they are in that basket. If they don't reach home alive it will be a great loss, for in many instances I got no flower or fruit of the Monocotyledons, and from the leaves only determination will be impossible. Of most of the things there are duplicates in the boxes sent direct to Kew, but it is just the few which are not in duplicate that I shall miss most. I think I have given you a full statement of the facts of my case. It is monstrous that an absurd law should be allowed to interfere with scientific work; and I see, notwithstanding all their care, they have Phylloxera badly enough about Naples. I got one or two things at Socotra that I think horticulturists will like—a *Begonia* with which I am very much delighted, and fortunately have some buds already home—a lovely little pink *Gentian*, and a *Crinum* with, as HUNTER tells me, a splendid truss of flowers. I did not get it in flower." We are happy to add to this note of Prof. BAYLEY BALFOUR's the welcome intelligence that the larger cases above alluded to, and which were sent by sea, and therefore escaped the clutches of the Italian Government, arrived at the Royal Gardens, Kew, on the 13th inst. They comprise five packages sent direct from Aden, including numerous specimens of the true Socotrine *Aloe*, *Aloe Perryi*, Baker MSS.; of the Dragon Tree, *Dracæna Ombet*; numerous species of *Stapelia* and *Euphorbia*, a *Jatropha*, a *Cotyledon*, *Marsilia coromandelina*, and many tubers and bulbs yet undetermined.

— THE WEATHER.—General remarks on the weather during the week ending May 10, issued by the Meteorological Office, London:—"The weather has been very dry and the sky moderately clear in nearly all parts of the kingdom. In the south-east and north-east of England and over Scotland, however, more cloud was reported than elsewhere, and at the close of the period the weather was dull at all our stations, and slight rain fell over the greater part of England. The temperature was again below the mean in all districts—as much as 5° or 6° below at most of the English stations, and from 2 to 4° elsewhere. The maxima were generally very low for the season, while over the central and northern parts of Great Britain and central Ireland several slight frosts were registered at night, the lowest of the minimum readings being 28°, at Durham. The rainfall was again less than the mean in all districts. Bright sunshine, except in the central and western parts of Great Britain, shows a decided decrease, and in the south and east of England and east of Scotland the number of hours recorded was only equal to about a quarter of the time during which the sun was above the horizon. The small percentage indicated for London is very striking. The wind was generally between north and north-east all over the kingdom, and though moderate, or light on most days, blew freshly at times at some of our eastern and southern stations. On the 5th and 10th, however, the direction was more variable, south-easterly and southerly winds being reported from our south-westerly coasts on the former day, and light westerly airs from the north of England on the latter.

— GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The Duke of CONNAUGHT has consented to take the chair at the thirty-seventh anniversary dinner of this Society, to be held at the "Albion," Aldersgate Street, on Wednesday, July 7.

## Home Correspondence.

The Sparrow Question.—*Apropos* of Primroses the great sparrow question has cropped up again, and my heart being hot within me on this subject I must beg to have my say. First let me premise that I was a lover and student of birds long before I could call a single plant my own, and that love still continues, to the exclusion of one species, *Passer damabilis* (I beg pardon) domesticus! The blackbird may steal our Cherries, but its glorious song compensates for pecks of them. The bullfinch may nip off a few buds, but its comparative rarity and pretty plumage plead for tolerance if not protection. As for throatsles, of all our songsters the most enduring, and north of the Trent the finest, I will only say that I fear it is owing to the havoc played with this species by the terrible winter of 1878-79 that we have been so plagued with slugs and snails, so that even deaf gardeners ought to protect it. I cannot call to mind any other bird except perhaps the pretty and cheery chaffinch that does not do more good than harm to the gardener. But the sparrow! Years ago some person calling himself a naturalist—he should have omitted the three final letters—put on record some awful fable as to the number of caterpillars a pair of sparrows destroy in a summer. As the unhappy man probably did not know, or from defective sight could not distinguish between a house sparrow and the useful little bird that has been outraged by the name of hedge-sparrow—a purely insect-eating bird of an entirely different order—we will acquit him of *malice prepense*, but what mischief has he done! Lamentations reach us from America, groans from New Zealand, wailings from Australia, all on account of sparrows imported on the faith of that yarn. But it may be fairly asked, what evidence can I bring forward against the accused bird? Well, sir, I have the misfortune to own a garden near a town which is frightfully infested with sparrows. It is, therefore, scarcely necessary to say that my Gooseberries and Currants have four-fifths of their buds picked off, that my yellow Crocuses are nipped off, that every row of Peas has to be carefully netted or nothing is left on them but strings of perforated and empty pods, that half the food given to the fowls is consumed by these harpies—all this is a matter of course. But in return I have a right to expect that there should not be a caterpillar in the garden, if there be a grain of truth in the insect-eating propensities of a bird with a beak as obviously adapted for eating grain as that of the hedge-warbler (I will not call it hedge-sparrow) is for eating insects. So far is this from being the case that I have never seen a garden where caterpillars were so rampant as this. The Gooseberries are defoliated first by the larvæ of *Abraxas grossularia*, then by the Gooseberry sawfly; The Apple trees are disfigured by the unsightly webs of *Yponomeuta padella*; and, finally, almost every plant with large leaves—*Pelargoniums*, *Chilian Beet*, and even the stinging *Wigandia*—is so riddled by the caterpillars of *Mamestra oleracea* and *M. brassicae*

(nice, juicy, hairless grubs that one would suppose irresistible to any bird, if only as a relish) that the garden by the end of September is a mere abomination of desolation. Yet I firmly believe that if every sparrow would eat but one caterpillar a day, so numerous are the birds, I should be wholly freed from insect pests. Finally, if it be a return for the damage it does me, to drive away other birds that really do eat insects, or to deaten me every evening with its hideous chirping, this return it certainly does make and no other. I can only trust that on my part I have done something to explode the imposture of the sparrow as a useful bird. F. L. S. [If country sparrows are annoying, London sparrows are infinitely more daring and troublesome. Eds.]

Maréchal Niel.—I enclose you a sample of a curious malformation, or disease, of which I have recently met with several examples. It quickly kills the Rose, and does not seem to proceed from the tenderness of the plant, the severities of the climate, nor budding on any particular stock. The example sent occurred on a clean stem in the conservatory, and is from 6 to 9 inches above the point of insertion of the bud. Moreover, the shoot is alive below the swelling, and a shoot is growing out of it. The appearance is exactly like a graft clayed over; though, as you will see, no foreign matter has touched the wood, which now seems a prey to fungus, or a species of dry-rot. D. T. Fish.

The Phylloxera Question.—I have forwarded a letter to the Council of the Royal Horticultural Society, which it may be of some interest to bring before your readers:—"In February last I brought under your notice the Government regulation from the Cape of Good Hope, prohibiting the introduction of Vines, plants, tubers, roots, bulbs, &c., and in March received a letter from your Council intimating that they were advised not to interfere in the matter. Since that time a regulation has come into force by which Germany, France, Italy, Austria, Spain and Portugal have made a similar prohibition, which is inflicting such a serious injury on horticultural industry that I venture again to bring the subject under your notice. You are doubtless cognisant of the convention that has been entered into by the above-named countries, and the slightest consideration will show what a paralysis and calamity it must be to horticulture. I therefore ask of a Society that has done so much for horticulture in times past, whether in the present emergency it will not render some assistance in getting such an obnoxious regulation rescinded or considerably modified—a regulation which, as you know, and all scientific men will affirm, is utterly futile for the purpose intended. You have probably seen that with this object a meeting has been held in Belgium, and a petition presented to the Minister there of Foreign Affairs, and that the Ghent deputies are going to bring the subject before the Belgian Parliament. The prestige in which the Royal Horticultural Society of London is held in foreign countries will, I hope, be maintained by whatever assistance you may deem useful in this emergency. It is almost needless to point out what a loss such a regulation is collectively and individually; in my own case, only last week I received several extensive orders for choice plants from the countries in which the regulation is actually in force, which orders I could not execute. I mention this as showing the grievousness of the regulation: for so little publicity has been given to it, that neither is it generally known or understood, or have horticulturists had notice of it. My knowledge of the Convention has only been received indirectly through my Belgian colleagues. [Our correspondent did not read his *Chronicle*.] At first sight this subject, viewed in councils of state, might appear trivial, yet an industry that is widely extended through all civilised countries cannot be unimportant—not the less so, because from its very nature it is quietly conducted—and one industry cannot be affected without others suffering; but quite apart from commercial and financial considerations, if Governments are to be stable and countries prosperous, surely it is desirable to foster instead of impede that which adds to the interest and occupation of the people, thus allaying discontent and its consequent results; indeed anything that adds largely to the innocent recreation, needs, and contentment of a nation, should not be vexatiously and unnecessarily interfered with by Governments. The urgency of the subject is my apology for troubling you." William Bull, F.L.S.

The Great Lizard Orchis at Llandudno.—Within the last few months a statement has appeared in several local newspapers and gardening journals to the effect that the Great Lizard Orchis (*Orchis hircina*) has been found at Llandudno. Botanists at a distance will like to know on what authority the statement has been made. The Llandudno mountain, commonly called the Great Orme's Head, contains about a thousand acres of rocky ground, the geological formation being mountain

limestone. Every part of it, with the exception of a few steep cliffs on the north-east side, immediately over the sea, is easily accessible. From the days of Pennant it has been famed for its rare plants, and every yard of it has been ransacked by botanists, and many lists of its plants have been published. The list has hardly been added to of late years, but some plants formerly found there have disappeared, through the frequent visits of collectors. Last year, however, a dealer in plants, a native of Kent, settled in Llandudno, and in due time announced that he had discovered there *Orchis hircina*, *Orchis fusca* (syn. *purpurea*), and *Ophrys aranifera*. The last may possibly have been found in Wales before, but the two former have hitherto been believed to be confined to the south-east of England, and *O. hircina* is extremely rare even there. When I came to Llandudno last week I at once searched for the dealer, and made enquiries of him, and I give the result. He told me that he had found many of *Orchis hircina*, and knew of about twenty more in the same spot, which he was going to dig up as soon as they were tall enough to move. He had only three left. One of these I bought for a sovereign—the price he asked, and offered to pay two for another, if he would show it to me growing wild. He would not do that. He was watched; and others would find them out, and exterminate the whole stock; but as soon as he had dug them all up he would show me the place he had dug them up from, with which I ought to be satisfied. He had not only found *O. fusca* and *O. aranifera* besides, but within the last few days *Cypripedium Calceolus* also. I asked him to let me see it. He first showed me what appeared to be an *Epipactis*, and on my telling him it was not a *Cypripedium*, he produced what certainly was a small *Cypripedium* of some sort. He told me he was going to dig up some more in a day or two, but would not allow me to go with him to see the place. I then asked him what other rare local plants he had. The first he showed me, which he said he found on the rocks near the Head, he did not know the name of, but I recognised it as *Claytonia sibirica*, and on my telling him it was not British, he supposed the seed must have blown from some garden. I did not disguise my incredulity, but he continued very good-humoured and communicative, and showed me several letters from botanists at a distance in proof of the truth of all he had said. No one pretends to have seen any of these plants growing wild, at Llandudno except himself, but, as he added, he was born and brought up in Kent, so of course knew more about Orchises than people were likely to do in North Wales. *C. Wolley Dod, Osborne House, Llandudno, May 8.* [A committee of the whole house should sit in judgment on this man. Eds.]

**Setting Peaches.**—I enclose herewith three shoots of Peach trees, to give you some idea of the set of Peaches in this garden. Their shoots do not represent an isolated case, but are truly representative of our set on trees against open walls, which have no further protection than a 12-inch board at the top of the walls, which are 10 feet high and 14 inches thick. We have two south walls 300 feet long, wired, which contain Peaches, Nectarines, Apricots, and Pears of sorts. The shoots show what can be done by good management, which is the true key of success in bringing good fruits to perfection on open walls. I have taken full crops from my wall trees the last two years, and I think you will admit I have a fair promise of a third. My success depends more on the management of the trees than on the protection afforded them. I grow just sufficient wood and sufficient fruit for the trees' health, and those I do well. *Robert Smith, Gr. to the Lady Francis Fletcher, Kenward, Yalding, Kent.* [The shoots were covered with young fruits as thick as Blackberries, and packed in Spinach leaves as big as London market Cabbage leaves. Eds.]

**Hardiness of Broccoli.**—To suppose that Broccoli which have escaped the winter are any the hardier for having done so, or that any raised from them will be more enduring, as "J. H." of Heytesbury, appears to think, is a very erroneous notion, as the only thing that has saved the few that any of us have from destruction is the favoured position the plants happen to have by occupying dry ground, or the exceptional shelter they may have had from trees or buildings, or, as is perhaps more general, the woody stems that some few among plantations have assumed owing to a check to growth during the summer or autumn. If we would have Broccoli stand our winters we must aim at getting them in this condition, and not, as we do now, at high cultivation, by planting in deep dug, heavily manured ground, where they produce immense leaves and stems so full of sap that when overtaken by frost they are rent asunder, so that after a thaw the whole structure collapses. This was the case last year, and whole plantations were a mass of rotteness, but which, had they been starved a bit, would have been saved. The summer was so wet and cold that plants made the greater part of their growth in the autumn, and as they were with-

out fibre, such as they have in ordinary seasons, they were not in a condition to meet a severe winter, hence the loss that accrued, which was more owing to their sappy succulent state than to the severity of the weather, as I am convinced that had they been ripened and hardened by sun, they would have stood very well, and it is noteworthy that such as have done so are those standing at wide intervals where they had plenty of room, air, and light playing around them. Although we all like to see and grow fine heads of Broccoli, it would be wise to sacrifice the chance of size for the sake of securing a supply, and instead of planting as we usually do, put half out on hard ground, after some other crop has come off. Much may be done likewise by pricking out the plants from the seed-beds as soon as large enough to handle, which prevents their becoming drawn, and adds immensely to the number of fibrous roots, which after all do more to build up solid leaves and stems than the large gross ones that supply more crude and watery matter. It needly hardly be remarked that the different kinds of Broccoli vary very much as to enduring powers, and that those having the shortest stalks are by far the hardiest, as witness the old dwarf Russian and Cattell's Eclipse, two that will frequently stand when all others perish. This fact should be borne in mind, as it is only by planting these and others of a similar nature that we can make at all sure of getting any late; but the early kinds can generally be had by heeling in and affording some kind of protection, such as a covering of straw, which saved me a fine lot in the autumn. *J. S.*

**The Falling of Peach Leaves.**—I can sympathise with a "Somerset Gardener," being one of those unfortunate craftsmen who are expected to be gardener, botanist, doctor, &c. I arrived here twenty years ago, and found some old and young Peach and Nectarine trees on the walls. I got a few from Messrs. Veitch to fill them up, and in eight years from 1860 the wall was covered with healthy trees, George IV. amongst the rest, a magnificent example, being a strong grower. In 1868 a Royal George Peach in the centre of the south wall was attacked with the following symptoms, and a "Somerset Gardener" will see if my observations coincide with his own experience, if not I should be glad to see the difference. This disease spread right and left, and eventually I burnt them all but four which, though young, had been planted, and these became attacked and would have been destroyed if I had not found a remedy in time. On the trees at this time of the year the shoots wither, and those more matured drop off at the touch, and the small leaves on the end of the shoots become spotted as described, and these become holes, those remaining being perforated and sickly. Many of the shoots died back, and some of the strongest growths, 1 foot to 18 inches, are found to be dead, and hang down the first fine day after dull weather. As time goes on the gum comes out of the branches, and they become full of black spots; also gum in the older branches by the shoots; and late in autumn and early spring the shoots and branches are spotted, many of them being found to be dead on examination. Remedies tried—Tobacco-water, soapsuds, and clear water, syringed every morning as hard as possible without injuring the leaves; also painted with lime in winter and taken from the wall, and the last dressed with slacked lime mixed with water: next morning syringed trees and wall with the same just before they started in the spring. These all failed, and during this period the fly was kept off, and the leaves were not curled. The trees in the houses had been pretty well, but now at once became affected with the same disease, and this was almost too much to bear. Everything having failed, the Peaches in the early house had just begun to stone, this I had fumigated eleven successive nights until I found they would stand no more as the large leaves began to crack, &c. This was useless; then I tried solutions, &c., with the same result. Some of the trees my employer wished me to take out, this I did in one instance, but regretted it afterwards, and, after all, I saved the crops of fruit in both houses, and many of the trees in these houses have been inmates for sixty or seventy years, and are as vigorous and as full of fruit now as they were twenty years ago. They have fruited well ever since my method has been adopted, and are improving every year. *W. Keel, Newton Park, Bristol.*

**Dynamite.**—Having used this explosive for some time for blowing up tree roots, and being novices at the beginning, we learned our experience as the work proceeded. Our first operation was with a small root with a 4-inch cartridge, which being rather more strength than the root required it was soon blown into match-wood. Our next operation was with a large Elm root, 5 feet in diameter and several tens in weight, situated in a corner between the church and the house, and where we could only act upon it from one side. To cleave it up with wedges was next to an impossibility, and to use dynamite in its present position

would be likely to endanger the church or the house, or perhaps both. By digging a trench round it and applying sufficient chains and the power of six horses, including the power of a builder's crab as a retaining power, we got the root far enough from the church not to run any risk of blowing in the windows. From our inexperience, instead of boring one deep hole in the centre we bored five holes, putting a 4-inch cartridge in each, which suited our purpose to make the block portable or easily lifted, to be burned up as rubbish. Unlike gunpowder, dynamite requires a special mode of firing, which consists of a very strong percussion-cap, called a detonator, attached to a fuse. This fuse, when lit with a match, sets fire to the fulminate, which exploding in its turn explodes the dynamite, and from experience, if the required quantity of dynamite has been pretty well calculated upon, and the depth of the hole pretty well guessed, with equal strength all round, there will be a burst, and sometimes the chips scattered for 100 yards round about; or if the root is Spruce, Silver Fir, or any soft wood, it often happens it is only broken in three or four pieces, sufficient to be lifted into a cart. In all cases where we have large standing trees to bring down we dismantle their top branches and dig a trench round the root, and as the tree comes down up comes the root, and with a cross-cut saw cutting the root of the bole, and boring a hole with a carpenter's auger and charging with dynamite, the root is soon made portable. With large old roots of trees that have been felled, sometimes, we simply dig a trench round them; by doing so it gives the operator a better idea where to find the most solid parts of the root before proceeding to bore for his charge. I have in no case tried putting the dynamite under the roots, but I have no doubt but it will succeed, though I fancy at a great waste. In charging I seldom put anything in the hole over the dynamite saves and, loosely; in one case I filled the hole up with water, and the charge acted well all the same. It may be considered dangerous, but as the fuse burns about a foot a minute there is time to get out of the way after applying the match. When the dynamite becomes frozen it requires to be gradually thawed in a warm room. *J. Miller, Clumber.*

**Calycanthemum of Primrose.**—I send you a curious malformation of this interesting plant. The plant seems somewhat unable to evolve a second proper flower, and so in lieu thereof it sets to work to change its sepals into petals, and to enlarge their size—the second phenomenon being to me the more singular of the two. Is the plant too well fed, or what? The leaves are large and very healthy. I hope you may not have seen any examples like it before. By the way, I notice a great tendency to degeneration of late years among such curiosities of vegetation as *Hose-in-Hose Polyanthus*, *Hen-and-Chicken Daisies*, &c. Are plants becoming more staid and ashamed of their eccentricities? I hope not. *D. T. Fish.* [A well-known, but none the less curious and pretty, state of things. Long ago it was stated that English gardeners could or did produce it by suppressing the natural corolla; but though we have made frequent inquiry, we have never met with any one to confirm the statement. It would be worth trying, however. Eds.]

**Caladium argyrites.**—The remarks of your correspondent, "J. S.," at p. 508, anent the cultivation of *Caladium argyrites* for decorative purposes in winter, are contrary to the opinion I have formed of the plant as having no equal in the class to which it belongs. I agree with "J. S." that to keep plants of this *Caladium* in the moist air of a stove prior to taking it to a comparatively cold room would be a very unwise thing to do. Most people, however, tone their plants off by giving them a lower and drier temperature some time before using them for decorative purposes. Under any circumstances I have never been able to discover that a "moist" atmosphere was other than inimical to the well-being of *Caladiums* at this dull time of year, and I can well believe "J. S." that if one desired to impair the health of plants, or even to kill them, his suggestion, if carried into practical effect, would be a very good way of accomplishing it. The variety above mentioned is so distinct from anything else, and its habit so different, that a little extra care is well bestowed upon so striking a gem for winter decoration. The plant is beautiful by itself, but I think I never saw anything so striking as a group of flowering and foliage plants which had a front row of *Caladium argyrites* overhung by another row of *Scarlet Pelargoniums*, the trusses of which hung gracefully over the beautifully marked leaves of the former, and had a very pleasing effect. *W. Hinds.*

**Double Daisies.**—Probably the fashion of bedding-out hardy plants for spring decoration in gardens has done as much to kill double Daisies on the one hand as it has assisted to popularise them on the other. Ere the bedding fashion came up those who

grew Daisies were content to allow them to remain in the borders and develop into huge clumps; but the bedding method necessitated the replanting twice in the year, and few hardy perennials take kindly to this frequent transplanting. The myriads of growers of Daisies for the market and costermonger lift and replant only in the autumn, pulling the plants well to pieces and planting up again in well manured soil. In this way very fine plants are sold in spring at a ridiculous price, and yet far more are grown than can be sold. The past spring season has found generally a dull sale, but rarely are two seasons alike; and perchance next spring the demand may be large. The beautiful and very ornamental golden-blotched kinds show their markings by far the best when grown in good soil; then the leaves are double the usual size, and the variegation the richest. Amongst the market growers the Double Red Quilled and Double White are chiefly grown. The large crown-flowered kinds flower too late to be of value. The best whites are the Market Giant, the White Globe, a fine quilled kind, and Virginia, a medium-sized early flowered kind, and blooms profusely. The best reds are the Market Red and its variegated form, and Bacchus, an early kind, with quilled flowers of medium size, and of a reddish-crimson hue. The only other colour is an intermediate mixture, a reddish-pink, and it is found in both flat-petalled and quilled forms. The best of these are Pink Beauty and Sunrise, the latter a very pretty and free-blooming kind. Double Daisies are such favourites in the garden that they deserve all the care and good cultivation possible. *A. D.*

## Reports of Societies.

Royal Horticultural: May 11.

SCIENTIFIC COMMITTEE.—Arthur Grote, Esq., in the chair.

*The Phylloxera Question.*—Dr. Masters brought up a report for presentation to the Council, detailing the steps taken by various foreign and Continental Governments, with a view to prevent the ingress and spread of the Phylloxera, and pointing out the unnecessary and even absurd restrictions imposed on the transit of living plants by some Governments. The report was adopted, and ordered to be laid before the Council.

*The Winter and the Plants.*—Dr. Masters laid on the table copies of the circulars drawn up with a view of eliciting information as to the effects of the late winter on various plants. These circulars can be had on application to the Secretary. Mr. G. F. Wilson suggested that information as to "unexpected survivals" should also be solicited. It was mentioned that this information could be inserted in the "remarks column." Dr. Gilbert alluded to the effect of the wet season of 1879 on the Wheat crops. In general terms the yield at Rothamsted was not half an average, though the straw was not correspondingly deficient, at least where manure was applied. An examination of the drain-water collected for the purpose showed that a large proportion of the nitrogen supplied in the manure was washed out of the soil by the rainfall, as a consequence of which the analysis of the grain showed but a small quantity of nitrogen in proportion to the quantity applied in manure.

*Unhealthy Condition of Plants.*—A letter was read from Mr. Tonks, detailing the ill-success which had befallen him in cultivating various plants where formerly he was very successful. The letter conveyed no hint as to the cause of the misfortune, which probably could only be discovered on the spot.

*Parasite on Sempervivum.*—Mr. W. G. Smith alluded to a parasite fungus, *Endophyllum sempervivi*—a rare plant, but which when introduced into the greenhouse had proved very destructive to species of *Sempervivum*.

*Gall on Eucalyptus.*—Dr. Masters showed a remarkable fusiform gall on a species of *Eucalyptus*, and which had been sent to him by Baron von Mueller. It was referred to Mr. MacLachlan for report.

*Plants Exhibited.*—Rev. H. Harpur-Crewe showed *Tulipa Orphanidesi*, *Fritillaria Ehrharti* from Syria with a small bell-shaped purplish flower edged with green; various species of *Muscari*, as yet unnamed; and a white variety of *Scilla italica*. Messrs. Veitch showed the elegant *Chionographis japonica*, introduced from Japan by Mr. Maries. It is a perennial, of tufted habit, with oblong-obovate, acute, wavy-margined, glabrous leaves, and an erect flower-stalk 12—18 inches high, with scattered lanceolate bracts, and terminating in a linear spike of sessile white flowers, each flower with six linear narrow white segments. *Anthurium Scherzerianum pygmaeum*, also from Messrs. Veitch, was shown. Its very narrow leaves and spathe, and its spadix stalked above the spathe, were points, irrespective of size, in which it differed from the ordinary form, and which secured for it the award of a Botanical Certificate (see fig. 107). Another *Anthurium* was shown, a cross between the ordinary *A. Scherzerianum* and the white variety: in this

case the spathe was (fig. 108) spotted with small red spots on a white ground. A curiously twisted variety of *Cryptomeria japonica* was also shown: the variety is figured in Siebold and Zuccarini's *Flora Japonica*.

FLORAL COMMITTEE.—Dr. Denny in the chair. It was somewhat remarkable that the genus *Anthurium* should produce the most remarkable novelties exhibited at two successive meetings, yet as on the last occasion, when *Anthurium Andreanum* was first shown in England, so on the present was shown for the first time a plant which in many respects is equally remarkable, *i.e.*, the curiously intermediate cross between *A. Scherzerianum* and its white variety raised by Mr. F. Bergman, gr. to Baron Rothschild at Ferrières and exhibited here by the Messrs. Veitch, who also staged beside it a singular seedling form from *A. Scherzerianum* with a distinctly pedicellated spadix. Mr. Sherwin gr. to M. Sparke, Esq., Charlewood House, Huyton, Liverpool, showed the remarkable example of *Odontoglossum odoratum* which he exhibited at Manchester the other week, and which to-day received a well merited Cultural Commendation. *Odontoglossum mulus* with a fine four-branched spike, came from Mr. Ebbage, gr. to J. S. Bockett, Esq.,

display; and Silver Banksian Medals were accorded to Mr. Rapley, gr. to J. Brand, Esq., Bedford Hill House, Balham, for a group of Herbaceous Calceolarias, also noted on p. 626; and to Mr. Cannell, for a display of bedding Pansies, Wallflowers, &c. From Chiswick, Mr. Barron sent a group of admirably grown Gloxinias, and also of Cape species of *Pelargoniums*.

### NEW PLANTS CERTIFICATED.

Messrs. James Veitch & Sons were awarded First-class Certificates for *Chionographis japonica*, a Japanese perennial white flowering, Melanthaceous plant, which is quite hardy, and admirably suited for the rockwork. For *Anthurium Scherzerianum Rothschildianum* ×, a very remarkable hybrid between *A. Scherzerianum* and its variety *alba*, raised by Mr. F. Bergman, gr. to Baron Rothschild at Ferrières, and which has the yellow spadix of the white form, and the spathe creamy-white spotted with crimson—in fact, exactly intermediate between its two parents; and for *Gloxinia Prince of Wales*, an erect flowering variety, with medium-sized blooms, which have the segments well defined by a marginal band of white, and the throat beautifully reticulated with a pleasing shade of violet. *Gloxinia Chiswick White*, an erect

FIG. 107.—ANTHURIUM SCHERZERIANUM VAR. PYGMAEUM.

Stamford Hill. Mr. Cannell sent a fine stand of cut blooms of *Pelargonium cucullatum flore-pleno*, a valuable plant for cutting, in the way of the old Copenhagen but more decidedly magenta in colour; cut blooms of the fine old border *Campanula persicifolia alba plena*; several seedling varieties of *Primula Sieboldii*; and cut blooms of brightly coloured and well marked *Mimulus*. Messrs. W. Cutbush & Son showed in *Buxus rotundifolia aurea reticulata* a variety of Box with the young leaves of a bright straw-yellow colour. *Lobelia Blue Star*, a vigorous-growing and free-flowering variety, with large blossoms of a bluish-plum colour and a white centre, was exhibited by Messrs. Charles Lee & Son, of Hammersmith; and Mr. George, of Putney Heath, had some cut blooms of *Carnation Surrey Belle*, flesh-tinted pink, striped with rose. From Mr. R. Dean, of Ealing, came cut blooms of *Bedfont Yellow*, *Belvoir Yellow*, and *Blood Red Wallflowers*, and also of several other good hardy plants.

In the large conservatory, Messrs James Veitch & Sons staged a large group of well-flowered, medium, and small sized plants, of various Indian Azaleas, most charmingly arranged in combination with handsome specimens of Japanese Acers. Some comments on the Azaleas will be found on p. 626, so that here we need only state that the Society's reward was a Gold Medal. A Silver Flora Medal was awarded to Messrs. William Paul & Son, Waltham Cross, for half a dozen boxes of cut Roses, an interesting and very attractive

flower of great size and purity, and of a very vigorous habit, raised at Chiswick by Mr. Barron, also received a First-class award. Mr. R. Weatherill, florist, Finchley, received similar awards for *Pelargonium Sunrise*, *Clipper*, and *W. E. Gladstone*, all decorative varieties, which are commented upon on p. 626. Mr. G. Braid, florist, Winchmore Hill, also received a First-class Certificate for a decorative variety named *Decorator*, and which is likewise noted in the paragraph before alluded to.

FRUIT COMMITTEE.—H. Webb, Esq., in the chair. Mr. G. Shelton, Commercial Street, Mount Gambier, exhibited several examples of South Australian produce, including a good sample of *Uvedale's St. Germain Pears*—gathered two months before ripe, three dishes of *Sweet Almonds*, two dishes of *Potatoes*, one of *Apples*, and one of *Danver's Yellow Onions*—an interesting display, which gained a vote of thanks for their exhibitor. Mr. Mares, gr. to C. Allhusen, Esq., Stoke Court, Slough, received a Cultural Commendation for very fine dishes of *Crawford's Early Peaches*, *Hunt's Tawny Nectarines*, fine in size and splendidly coloured; and a capital dish of *President Strawberries*. Mr. Hinds, gr. to Lord Wimborne, Canford Manor, also received a Cultural Commendation for a grand dish of *President Strawberries*, the produce of plants wintered without any glass protection, and potted the second week in August; excellent samples of *William I. Peas*, grown in 9-inch pots in a

cool orchard-house; Veitch's Ashleaf Potatos, and Mushrooms. A similar award was also accorded to Mr. Hudson, gr. to J. Atkinson, Esq., Gunnersbury House, Acton, for half-a-dozen nice Queen Pines. Mr. Miller, Clumber Gardens, Worksop, sent a capital dish of Vicomtesse Héricart de Thury Strawberries, and well kept examples of Ne Plus Meuris, Winter Nelis, and Passe Colmar Pears. Mr. Ledsham, Green Lane, Tarvin Road, Chester, sent examples of a very promising variety of late Broccoli, which the committee requested to see again next month. The heads range from small to medium size, the *beau idéal* of a first-class Broccoli in size, shape, and whiteness, and, as we can affirm, of very delicate flavour.

Notices of Books.

Sugar-Beet. By Lewis Ware. London: Sampson Low & Co. Svo.

The object of this book is to give a sketch of the

Beet in England, and a much more serious omission is the entire absence of all notice of the elaborate experiments carried on with so much care at Rothamsted by Messrs. Lawes and Gilbert.

La Culture Maraîchère. (Market Garden Culture for the South and Centre of France and for Algeria.) By M. A. Dumas. Fourth edition. Paris: Rothschild; London: Dulau.

This is one of the series of handy little books for which the French have to thank the publisher. The author claims for his book special consideration as being a work for gardeners written by a gardener, and a gardener moreover who is not one in name only, but one who, as he tells us, handles the spade and the dibber every day of his life. After giving a chapter of generalities as to the aspect of the garden, the nature of soils and of garden operations generally, he passes on to the culture of particular plants, arranging them in order according to their family relation-

Other similar trenches are dug at distances a yard apart. When all is ready the young Asparagus plants—preferably those of two years' growth—are placed on the little mounds in the trenches, the roots being carefully spread out over them and fine soil carefully sifted in between them. The trench is then filled in nearly to the top with compost, in which fowls' dung or night soil has been mixed. A caution is given against too deep planting, and when frost is anticipated then the stems should be cut about 4 inches above the surface, and the whole covered with a layer of dung. During the autumn the plants should be watered freely with liquid manure. The shoots are not cut till the third year, after which time the shoots may be cut each year from April to July. This summary may suffice to show the practical character of the work. Under the head of "vulgar errors or prejudices" he instances the dislike which it appears some Frenchmen have to the toad and to the mole, both animals which render the greatest services to the agriculturist and the gardener, and whose evil deeds are more than compensated for by the good they do. The influence of particular phases of the moon is ridiculed, and still more so the fog or blight (*brouillard*). "My Lettuces are weakly and small—it's the fog; my Beans are covered with greenfly—it's the fog; my Scarlet Runners and my Peas are full of grubs—it's the fog—the fog—the fog—always the fog." To those who make this complaint the author recommends a visit to those districts where the fog is most frequent, thickest, and most persistent. Look round the gardens, says he, in the environs of Paris, of Tours, of Angers—he might have added London—and see if the fog causes the dreadful consequences by some attributed to it. There, continues the author, "you will find luxuriant growth; garden produce of first-rate quality. The fog is powerless for mischief—guess why. It is because the gardens are cultivated with energy and intelligence, neither labour nor expense is spared to give the plants the necessary supply of water, and to furnish them with abundance of manure."

We cordially commend the book to all gardeners, to whom the somewhat idiomatic phraseology in which the book is written offers no obstacle.

FIG. 108.—ANTHURIUM ROTHSCHILDIANUM X. (SEE P. 630.)

- May 6.—Dull till noon. Fine and bright afterwards. Cool. Cloudy at night.
- 7.—A fine bright morning, cloudy afterwards. Overcast at night. Cold.
- 8.—A fine day, partially cloudy till evening, then cloudless. Cold.
- 9.—A fine day, but dull and cloudy. Occasional gleams of sunshine. Cold.
- 10.—A dull day, very cloudy. Occasional thin rain. Very cold.
- 11.—Dull till 10 A.M. Fine and bright after. Clear at night. Warmer. Windy.
- 12.—A very fine bright day. Warmer. Strong wind, Cloudless and cold at night.

LONDON: *Barometer*.—During the week ending Saturday, May 8, in the vicinity of London the reading of the barometer at the level of the sea decreased from 30.08 inches at the beginning of the week to 29.69 inches by the afternoon of May 3;

history of the Beet-sugar industry in Europe, the varieties grown, the soil, tillage, yield, cost of cultivation, harvesting, transportation, conservation, feeding qualities of the Beet and of the pulp. The title-page, from which we have abstracted the above, might well have been termed the table of contents; at any rate, it serves well to give a general idea of the nature of the work. The author has had special and lengthened opportunities of studying all departments of his subject, and is anxious to turn his knowledge to account by introducing the culture of the Beet, and the manufacture of the sugar, into the States. That he would thereby do a good thing there can be no doubt. But he will have to reckon with the tax-collector, and with fiscal regulations which have proved the ruin of the manufacture in this country, and have to some extent checked its development abroad. It is to be hoped that the Americans may be wiser. In spite of all restrictions, however, the number of Beet-sugar factories in France in 1877-78 is given at 513, the number of kilos produced 325,000,000. The book is so carefully compiled that it will be useful to farmers in general to those who grow Mangel for their cattle. No mention is made of the attempts to grow Sugar-

ships, and finally gives a calendar of operations for each month of the year. We may briefly summarise the author's recommendations as to the culture of Asparagus, which are the more interesting as such large quantities arrive in our markets at this season from the South of France. The seed is sown in March or April in a light, highly manured soil, which should be well dug during dry weather. The soil being thus pulverised the seed is sown broadcast, or in lines 4 to 5 inches apart, the latter method being preferable, taking care not to sow too thickly nor at a depth of more than 3 to 4 inches. In dry seasons watering may be necessary, and when the seed has germinated hoeing is requisite. The bed for the permanent plantations should by preference be sandy, deep, very friable, the best in the garden, and exposed to the south. It should be trenched and well manured. The ground being prepared in the manner indicated, in February or March a trench is dug, some 16 to 18 inches deep and as much in width, the soil being thrown out on each side of the trench to a distance of 16 to 18 inches. At the bottom of the trench so made little mounds of fine earth about 4 inches high are raised, at a distance one from another of a yard.

and increased to 30.22 inches by the end of the week. The mean reading for the week at sea level was 29.99 inches, being 0.18 inch below that of the preceding week, and 0.06 inch above the average.

**Temperature.**—The highest temperatures of the air observed by day varied from 65° on the 2d to 49½° on the 5th; the mean value for the week was 57°. The lowest temperatures of the air observed by night varied from 32° on the 2d to 45½° on the 4th; the mean for the week was 38½°. The mean daily range of temperature in the week was 18½°, the greatest range in the day being 33° on the 2d, and the least 6½° on the 5th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—May 2, 46°.7, —3°.4; 3d, 45°.9, —4°.5; 4th, 48°.6, —2°.6; 5th, 44°.7, —6°.5; 6th, 47°.5, —4°.1; 7th, 45°.2, —6°.5; 8th, 45°.2, —6°.4. The mean temperature of the air for the week was 46°.3, being 4°.8 below the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 145° on May 2, 135½° on the 8th, and 132½° on the 7th; on the 5th the reading did not rise above 90°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 23½° on the 2d, 27½° on the 7th, and 28° both on the 3d and 8th; the mean of the seven lowest readings was 31½°.

**Wind.**—The direction of the wind was N.E. and E.N.E., and its strength moderately strong.

The weather during the week was fine, though dull and cold; the sky was most cloudy. A slight thunderstorm occurred on the 3d inst.

Rain fell on two days during the week; the amount measured was 0.17 inch.

**ENGLAND: Temperature.**—During the week ending Saturday, May 8, the highest temperatures of the air observed by day were above 64½° at Blackheath (London), Leicester, Cambridge, and Nottingham, and below 57½° at Norwich and Hull; the mean value from all stations was 62°. The lowest temperatures of the air observed by night were below 33° at Truro, Bristol, Blackheath, Cambridge, Sheffield, and Hull, and above 38½° at Liverpool and Sunderland; the mean value from all places was 35°. The extreme range of temperature in the week was above 33° at Blackheath, Cambridge, and Nottingham, and below 20° at Norwich and Liverpool; the mean range from all stations was 27°.

The mean of the seven high day temperatures was above 59½° at Truro, Plymouth, and Nottingham, and below 53½° at Norwich and Hull; the general mean from all places was 57°. The mean of the seven low night temperatures was below 38° at Wolverhampton and Hull, and above 41½° at Plymouth, Norwich, and Sunderland; the mean from all stations was 39½°. The mean daily range of temperature in the week was above 21° at Wolverhampton and Nottingham, and below 14° at Norwich and Liverpool; the mean daily range from all places was 17½°.

The mean temperature of the air for the week from all stations was 46½°, being 4° higher than the value for the corresponding week in 1879. The mean temperature was above 49° at Truro and Plymouth, and below 45° at Sheffield and Hull.

**Rain.**—The amounts of rain were small everywhere, and varied from 0.31 inch at Plymouth to 0.02 inch at Leicester and Bradford. At Truro, Wolverhampton, Liverpool, Leeds, and Sunderland no rain fell. The average fall over the country was 0.07 inch.

The weather during the week was somewhat fine and dry, though dull, with cold winds. Thunderstorms occurred at some places on the 3d inst.

**SCOTLAND: Temperature.**—During the week ending Saturday, May 8, the highest temperatures of the air observed by day varied from 64° at Dundee and Perth to 59° at Edinburgh; the general mean from all places was 62°. The lowest temperatures of the air observed by night varied from 30° at Perth to 38° at Glasgow; the mean value from all stations was 34°. The mean range of temperature in the week from all places was 28°.

The mean temperature of the air for the week from all stations was 47°, being 2½° higher than the value for the corresponding week in 1879. The mean temperature was above 49½° at Glasgow, and below 46° at Aberdeen.

**Rain.**—At Dundee the amount of rain measured was 0.25 inch, whilst at Aberdeen 0.06 inch only was recorded. At Greenock and Perth no rain was measured. The average fall over the country was 0.08 inch.

**DUBLIN.**—The highest temperature of the air was 59½°, the lowest was 32°, the extreme range 27½°, the mean 46°. No rain was measured.

JAMES GLAISHER, F.R.S.

Enquiries.

He that questioneth much shall learn much.—Bacon.

**HARES AND RABBITS EATING YOUNG SPRUCE.**—Is there any practical way of preventing hares and rabbits eating young Spruce in plantations otherwise than by enclosing them with wire netting? *Kirkby.*

**TURNPIKE TOLLS.**—Will you be good enough to inform me whether a turnpike toll is payable on earth or loam used for nursery purposes? *E. W. S.*

Answers to Correspondents.

**ANTHURIUM SCHERZERIANUM:** *Nimrod.* We should object to both being shown, as being too nearly alike.

**BOOKS:** *H. C. The Orchid Grower's Manual,* by Mr. B. S. Williams; *Cool Orchids, and How to Grow Them,* by Mr. F. W. Burbidge (Bogue); *Orchids for Amateurs,* by Britten and Gower (Bazaar Office). Messrs. Lovell, Reeve & Co., Henrietta Street, Covent Garden, can supply you with coloured plates of Orchids.

**CALCEOLARIAS:** *Kelway & Son.* An ordinary good strain, such as is grown by several of the leading market growers, but inferior in size to the strains of Mr. James and Mr. Rapley.

**CINERARIA:** *W. Ward.* Your double Cineraria is, to the best of our recollection, hardly of the same shade of colour as the new one shown recently under the name of Mr. Thomas Lloyd; but we cannot say for certain, without flowers of both for comparison. Whether similar or distinct, it is a first-rate flower.

**DARI:** *C. W. Abrey.* The seeds of Sorghum vulgare, more properly known under the popular name of Durra. The flour made from it is used in India as food, and, unground, for feeding horses, pigs, and poultry. It cannot be grown to advantage in this country.

**DOUBLE PRIMROSES:** *James Carter & Co.* Your Cloth of Gold Primrose is a very desirable variety for border culture.

**ERRATUM** (p. 599).—For "Violette de Galopin and Reine Claude Rouge are delicious," read "are delicious." I forgot to say Beurré Hardy and Gratiot of Jersey, on the Quince stock, are annually good bearers, large, and delicious. *W. F. Radcliffe.*

**GREENHOUSE PLANTS:** *Syd.* Your question is too vague.

**INSECTS:** *G. H.* The grub of the Crane-fly or Daddy Long-legs, Tipula oleracea. See p. 621. Encourage the Rooks.

**LICHEN ON LAWN:** *A. L.* Rake it off, and encourage the growth of the grass by a dressing of nitrate of soda or sulphate of ammonia.

**MIMULUS:** *T. Bayliss.* Your seedlings are very fine, being large in size, smooth, boldly marked, and richly coloured.

**NAMES OF PLANTS:** *Tytus.* 1, Clematis viticella; 2, Kleimia ficoides; 3, Alyssum saxatile; 4, Pulmonaria officinalis; 5, Vinca major; 6, Leucocitum vernum; 7, Abies Pinsapo.—*W. Powell.* Both are cultivated varieties of Geranium pratense.—*W. P. Clayton virginiana.*—*R. S. H.* All seedling varieties of the Norway Maple. The Pinus is the P. Massoniana of gardens, more properly called P. Thunbergii.—*C. W. D.* Arabis hirsuta and Cotoneaster vulgaris.—*H. J. Ross.* Aeries falcatum and Dendrobium crepidatum.—*P. & M., Leytonstone.* Pachysandra terminalis.—*E. C. C. D.* Carex glauca.—*James Rimmer.* 1, Cattleya labiata; 2, Cattleya elegans; 3, Saccolabium guttatum; 4, Phajus bicolor.—*R. A.* 1, Chlorozema Henchmanni; 2, Pultenea subumbellata; 3, Woodwardia radicans; 4, Pteris tremula; 5, Doodia caudata, sterile frond.—*E. Bennett.* 1, Brassia verrucosa; 2, a Dendrobium, which we do not recognise; 3, a garden variety of Epacris, which we can not name; 4, Clematis montana.—*W. R., Lark Hill.* Both varieties of Lilium longiflorum.—*T. Davies.* Aquilegia cœrulea.

**NEW ZEALAND SEEDS:** *J. T. S.* They will grow in a mixture of peat, loam, and sand, but must be given a greenhouse temperature.

**PINE FOREST NEAR RAVENNA.**—The inquirer at p. 568 may refer to Brandis' *Forest Flora*, p. 516, where the Stone Pine forest stretching along the coast of the Adriatic is noticed under Pinus pinea. He will also find bibliographic notices of this celebrated pinetum in De Berenger's *Studi di Archeologia Forestale*, Venice, 1863. *H. Cleghorn.*

**POLYANTHUSES:** *B. S. W.* A nice strain of border flowers, but of no value as florists' flowers.

**SEEDS TO NAME:** *H. Woodmanson.* The seeds are those of Abrus precatorius, a leguminous tropical plant of a twining habit. They are very pretty and much used in India, &c., for necklaces and other ornaments, as well as a standard of weight in the weighing of diamonds.

**THE SOUTH OF FRANCE:** *H. B.* No doubt you might, with some trouble, find employment in some of the towns in the South of France to which the English resort, such as Cannes, Hyères, Nice, Mentone, Pau, and many others; but we should not recommend you to go to any of those places now, unless you wish to be roasted.

**FOREIGN SUBSCRIBERS** sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

**CATALOGUES RECEIVED:**—William Paul & Son (Walham Cross, Herts), Catalogue of New Roses, Pelargoniums, Phloxes.—Dicksons & Co. (1, Waterloo Place, Edinburgh), Descriptive Catalogue of Florists' Flowers.—Boulton & Paul (Rose Lane Works, Norwich), Illustrated Catalogue of Iron and Wire Fencing, Tree Guards, Garden Frames, Plant Preservers, &c.—George Cooling (Bath), Catalogue of Roses in Pots, Clematis, Lilliums, Bedding Plants, &c.—E. G. Henderson & Son (Maida Vale, W.), Catalogue of Flowering and Ornamental Plants, &c.—Samuel Yates (16, Old Millgate, Manchester), Catalogue of Hives and Bee Furniture.—Paul & Son (The "Old Nurseries," Cheshunt), Catalogue of New "Cheshunt" and English Seedling Roses.—V. ## SEEDS.

LONDON: May 12.—The consumptive demand for the present season being nearly over, the seed markets begin to assume a quiet appearance. There is, however, some speculative inquiry for American Clover seed, under the influence of which values have made a substantial advance. The stocks remaining on hand prove to be light, and are mainly held on American account. Trefoil also meets with some attention for holding over: this is caused by the unfavourable reports received as to the growing crop. There is no quotable variation in either Alsike, white, or Rye-grass. Tares are neglected. Fine sowing Rape seed is scarce, and must be noted 2s. to 3s. per quarter dearer. Mustard keeps firm. There is a good sale for white runner Beans: current rates continue unprecedentedly low. Some handsome blue Peas, just arrived from New Zealand, are now offering on Mark Lane, the quality of which far surpasses those of English growth. Choice Sicilian Canary seed is obtainable at 53s. per quarter; Hemp seed, 31s.; Haricots and Lentils sell lowly. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

## CORN.

Trade at Mark Lane on Monday was firm. Millers operated sparingly in Wheat, and no material change presented itself from last week: the home-grown produce was no higher. Barley met with a poor inquiry, and prices were unaltered. Malt was quiet and about the same in price as last noted. Oats were in large supply, and for the better qualities prices were the turn higher. Maize showed an improvement of from 3d. to 6d. on the week. Beans were scarce and firm, Peas were fully as dear, and flour moved off slowly on former terms.—Trade was rather firm on Wednesday. As regards Wheat there was not much doing, but the finer sorts were held for rather more money, and the tendency was distinctly in favour of the holder. Barley was quiet and unaltered. Malt remained dull. Oats, although in good supply, were well held, and a steady tone prevailed as regards Maize. Beans and Peas were scarce and firm. Flour was quiet, but fully as dear.—Average prices of corn for the week ending May 8:—Wheat, 46s.; Barley, 33s. 4d.; Oats, 26s. For the corresponding period last year:—Wheat, 40s. 9d.; Barley, 30s. 9d.; Oats, 21s. 6d.

## CATTLE.

At the Metropolitan Market on Monday the trade in beasts was dull and prices scarcely as good as on Monday se'nnight. Trade in sheep was not so brisk as of late, and it was difficult to effect a clearance notwithstanding a disposition to take rather lower than we quote. Lambs were lower, and good calves continue to be scarce and dear. Quotations:—Beasts, 4s. 6d. to 5s., and 5s. 6d. to 6s.; calves, 5s. 6d. to 6s. 8d.; sheep, 5s. 6d. to 6s., and 6s. 4d. to 7s.; lambs, 8s. to 8s. 4d.; pigs, 4s. 6d. to 5s. 4d.—Thursday's cattle trade was quiet. Beasts were firm, owing to short supplies; sheep and lambs were very quiet at about late rates; and the figure for calves and pigs were unaltered.

## HAY.

Tuesday's Whitechapel Market report states that the trade for fodder was very dull, and prices without variation. Quotations:—Prime Clover, 100s. to 132s.; inferior, 60s. to 95s.; prime meadow hay, 80s. to 100s.; inferior, 30s. to 70s.; and straw, 30s. to 37s. per load.—On Thursday there was a moderate supply of hay and straw on sale. The trade was quiet, and prices were unaltered.—Cumberland Market quotations:—Superior meadow hay, 98s. to 105s.; inferior, 45s. to 75s.; superior Clover, 125s. to 132s.; inferior, 80s. to 105s.; and straw, 36s. to 40s. per load.

## POTATOS.

The Borough and Spitalfields Markets reports state that trade has continued quiet, but owing to the smaller foreign supplies, prices had rather a firmer tendency. Quotations:—Scotch Regents, 140s. to 160s. per ton; Champions, 180s. to 200s.; Lincoln ditto, 180s. to 190s.; Victorias, 160s. to 180s.; German reds, 4s. 6d. to 7s. 6d. per bag; and Dutch rocks and French whites, 4s. 6d.—The imports into London last week were confined to 28,126 bags from Hamburg, 2875 bags Stettin, 6621 Harburg, 1350 boxes Lisbon, and 374 boxes and 154 casks from Malta.

## COALS.

The prices current at market during the week were as follows:—Bower's West Hartley, 14s. 3d.; West Hartley, 14s. 3d.; Walls End—Hetton, 14s. 6d. and 15s.; Hetton Lyons, 13s. 6d. and 14s.; Hawthorns, 13s. 9d. and 14s. 3d.; Lambton, 14s. and 14s. 6d.; Original Hartlepool, 15s. and 15s. 6d.; Wear, 13s. 6d. and 14s.; South Hetton, 14s. 6d. and 15s.; Vanes, 13s. 6d.; Chilton Tees, 14s. 6d. and 15s.; East Hartlepool, 14s. 6d.; South Hartlepool, 14s. 6d.; Tees, 14s. 3d.; Tunstall, 14.; Radford Navigation, 15s. 6d. The higher prices prevailed in the early part of the week.

**Government Stock.**—Consols closed on Monday at the following figures:—For delivery, 99 to 99½; for the account, 99½ to 99¾. Tuesday's prices were, 99 to 99½ for delivery, and 99½ to 99¾ for the account. The final figures on Wednesday were, for the account, 99¾ to 99⅞, and 99 to 99½ for delivery. The closing prices on Thursday were, for the account, 99¾ to 99⅞, and 99½ to 99¾ for delivery.

Monthly, price 1s. Annual Subscription, 12s., post-free.

THE  
JOURNAL OF FORESTRY  
AND  
ESTATES MANAGEMENT.

Programme of Vol. IV., commencing May, 1880:—

In commencing a new volume of the *Journal of Forestry*, the Editor has pleasure in announcing that he has arranged for a large number of articles on almost every conceivable branch of Arboriculture and Estates Management: the chief features of the Journal, which have been found of so much value in former years, will be preserved, and these will comprise the following:—

**EDITORIAL NOTES** on current arboricultural matters, at home and abroad, topics of the day, the weather, and the persistent advocacy of a British School of Forestry.

**THE EDITOR'S BOX.**—Short letters and facts from Readers, discussions on various practices and methods, and any other subjects which can be elucidated in this manner, besides jottings from the note-books of our practical contributors.

**THE HOME FARM.**—A monthly epitome of the work to be performed in the home farm, by a land steward of great experience, with judicious hints and advice on the management of crops, farm stock, poultry, &c.

**FOREST WORK FOR THE MONTH.**—This is one of the most valued features of the *Journal*, and contains a precise, accurate, and reliable *resumé* of the forest operations which should be performed each month in England, Scotland, Wales, and Ireland, by a well-known experienced Forester in each country.

**NOTES AND QUERIES.**—Questions on any subject connected with forestry or estate management may be asked under this heading, and answers given by the Editor or some experienced contributor.

**REVIEWS OF BOOKS.**—The principal new books connected with rural pursuits, and the transactions of several of the learned societies, are critically examined and reviewed on their own merits.

**OUR FOREIGN EXCHANGES** gives a monthly epitome of the foreign arboricultural and gardening papers; and attention is by this means often directed to important articles in foreign periodicals, by Dr. J. C. Brown, late Government Professor of Botany at the Cape of Good Hope, who kindly undertakes this department.

**CHIPS AND SLIPS** are cuttings from "here, there, and everywhere," and contain just those odd scraps and gleanings from our contemporaries as are considered of an interesting nature to our readers.

In addition to the above leading features, which appear in each number of the Journal, the Editor is enabled, through the courtesy of the Staff of Contributors, to announce the following subjects, on which, amongst others, articles may be expected in the present volume:—

THE CONVERSION OF TIMBER, AND THE MACHINERY EMPLOYED. [PLANTING.

STEAM CULTIVATION AS A PREPARATION FOR TREE BRICK AND TILE MAKING.

PLANTING FOR SHELTER, AND FOR EFFECT OR ORNAMENT.

THE STRENGTH, DENSITY, AND USES OF TIMBER.

THE VALUATION AND MEASUREMENT OF TIMBER.

NOTES ON THE NEWER CONIFERÆ.

REMARKABLE TREES AT HOPEFORTH HOUSE.

THE PRESENT TRAINING OF OUR INDIAN FORESTERS.

ADVANTAGES OF A BRITISH SCHOOL OF FORESTRY.

A SYNOPSIS OF BRITISH ELMS.

PLANT RESPIRATION AND NUTRITION.

UTILITY OF PLANTING "ABIES DOUGLASSII."

CLIMATIC INFLUENCE OF TREES.

THE EDUCATION OF YOUNG FORESTERS.

THE LARCH DISEASE.

FOREST ENTOMOLOGY.

THE EUCALYPTS OF AUSTRALIA.

MANUFACTURE OF CHARCOAL AND PYROLIGNEOUS ACID.

ACCLIMATISATION OF NEW ZEALAND SHRUBS ON OUR WEST COAST.

NEW ZEALAND A FIFTH FOR TREE PLANTING.

THE COMPARATIVE GROWTH OF AMBER TREES.

UNDERWOOD.

COST OF HARVESTING OAK BARK.

THE APPLIANCES USED IN FORESTRY.

DRAINING.

ROAD MAKING.

GLANCES AT THE FORESTS OF SOUTHERN EUROPE, &c.

The June number will contain a comprehensive and reliable return from all the principal Estates in the Kingdom of the Prices realised during the past season for Timber, Underwood, Bark, and other Forest Produce.

PUBLISHED BY

J. & W. RIDER, 14, BARTHOLOMEW CLOSE, LONDON, E.C.

## WORKS FOR THE POSSESSORS OF GARDENS.

**HIGH CLASS KITCHEN GARDENING.** A Handy Manual for the Improved Cultivation of all Vegetables. By WILLIAM EARLEY, Author of "How to Grow Mushrooms," "How to Grow Asparagus," &c., &c. Crown 8vo, with Coloured Frontispiece. Price 4s. 6d.

**LINDLEY'S DESCRIPTIVE BOTANY.** For Self-Instruction and the Use of Schools. Price 1s. sewed.

**LINDLEY'S MEDICAL AND ECONOMIC BOTANY.** With numerous Illustrations. 8vo, cloth. Price 5s.

London: BRADBURY, AGNEW & CO., Bouverie Street, E.C.

By Permission of the Hon. Board of Customs.  
(Free of Duty.)

# CORRY & SOPER'S NICOTINE SOAP (PATENT).

An effectual and speedy Eradicator of Scale, Thrips,  
Green Fly, Mealy Bug, Red Spider,  
American Blight,  
and all Parasites affecting Plants, without injury to  
Foliage.

It may be used with perfect safety and efficiency for the  
Destruction of Gooseberry Caterpillars.

Especially adapted for the Destruction of Blight on the  
Coffee Plant.

The Proprietors have great pleasure in bringing to the notice  
of Horticulturists generally this valuable preparation, the  
basis of which is Nicotine, or the Oil of Tobacco, with which  
is blended other essential ingredients, to render it available as a  
general INSECTICIDE.

It has now undergone a thorough test by some of the most  
practical men in Horticulture, and it is proved beyond all doubt  
that no Insecticide will bear comparison to it for killing properties  
with Perfect Safety to Foliage.

It may be used as a Dip or Wash for any description of out  
or indoor Plants, and as a Dressing for the Bark of Fruit Trees,  
Vines, &c., it has no equal.

The following is a fair sample of Testimonials, selected from  
some hundreds lately received from men of considerable experience:—

Messrs. J. & J. HAYES, *Nurserymen, Edmonton, London, N.,*  
on Feb. 9, 1880, write:—

"We consider your Nicotine Soap a great boon to all who  
have anything to do with plants or fruit growing, as it is so very  
useful for dipping and syringing when it is not convenient to  
fumigate. You are quite at liberty to make what use you  
please of this."

Messrs. OSBORN & SON, *The Fulham Nurseries, London,*  
write:—

"We have given your Nicotine Soap a fair trial, and our  
experience confirms the character you give it, that it is an  
unrivalled preparation for killing insect life, without injury to  
plants."

Mr. B. MALLER, *Burnt Ash Nursery, Lee, London, S.E.,*  
on Feb. 9, 1880, writes:—

"I have given your Nicotine Soap a fair trial, and I must  
now say it is very satisfactory. I am now having it used freely  
for syringing,  $\frac{1}{2}$  pint to 4 gallons of water, without the least  
injury to the foliage."

Mr. J. C. SYERS, *Orchid Grower to Sir Trevor Lawrence,*  
*Bt., Buryard Lodge, Dorking, on Nov. 24, 1879, writes:—*

"I have now tried in many ways your Nicotine Soap  
as an insecticide for Orchids, and it has given me great satisfaction," &c.

Messrs. LARNWELL & TILBURY, *Nurserymen, Worthing,*  
on March 19, 1880, write:—

"Having used Corry & Soper's Nicotine Soap this year, we  
can with pleasure say it is the most useful insecticide that has  
ever come under our notice. We have tried it on Strawberry  
plants when in bloom, and find it most effectual in destroying  
the fly, whilst it does not in the least injure the plants or  
flowers, but gives a better and healthier growth to the plants."

Mr. GEORGE ABBEY, *Gardener to C. M. Palmer, Esq., M.P.,*  
*Greenle Park Garden, Saltburn-by-the-Sea, on February*  
*20, 1880, writes:—*

"The Nicotine Soap I had from you I find a safe and powerful  
insecticide, being destructive of every kind of insect infesting  
plants, and in no instance has any injury been done to the  
foliage. At a strength of 3 oz. to a gallon of water, I have  
used it for syringing Peaches during growth for the destruction  
of red-spider, without injury in any way (only to the insect!—  
which it instantly kills). At that strength to 4 oz. to the gallon  
it may, with perfect safety, be employed for syringing every  
description of fruit tree, whether under glass or outdoor, and  
a majority of plants, without the least injury, whilst at the  
same time it destroys aphides—green, brown, blue, and black  
—thrips, and red-spider. At a strength of 6 to 8 oz. to a gallon  
of water, I have employed it very successfully for destroying  
mealy-bug, brown and white scale, both by syringing the  
plants and applying with a brush, its effects upon the insects  
making its application gratifying; whilst from its grateful  
smell, it is pleasant than otherwise. At a strength of 8 oz. to  
the gallon I found it a first-rate winter dressing for fruit trees,  
mealy-bug on Vines, as well as a destroyer and preventive of  
red-spider, thrips, and aphides. It also destroys American  
blight."

The following Nurserymen authorise us to say they have  
used the Nicotine Soap with unqualified satisfaction:—

J. Laing & Co., Forest Hill, London, S.E.; Hawkins &  
Bennett, Twickenham, S.W.; G. Edwards, Balham, S.E.;  
E. & A. Smith, Dulwich, S.E.; J. Feed & Son, Roupell Park,  
Lower Norwood, S.E.; G. Brand, Winchmore Hill, N.; Hooper  
& Co., Covent Garden, W.C.; Lacombe, Pince & Co., Exeter;  
Edwin Cooling, Derby; T. Frost & Sons, Maidstone; W. C.  
Drummond, Bath; G. & W. Yates, Manchester; W. Bryant,  
Rugby; J. Stewart & Son, Dundee; J. Cocker & Son, Aber-  
deen; J. Charlton, Tunbridge Wells; Edmonson Bros., Dame  
Street, Dublin, &c.

Sold in jars, 8 oz., price 1s. 6d.; 20 oz., price 3s.; and in  
tins, 14 lb., price 16s. 6d.; and drums, 28 lb., price 25s.;  
56 lb., price 50s.; 112 lb., 95s. Full directions for use on each  
package.

And 2 oz. sample jars, 6d. each.

Full directions for use on each package.

Manufacturers of Tobacco Powder, Tobacco Juice (duty free),  
Tobacco Paper and Cloth, and Horticultural Sundriesmen.

May be obtained from all Seedsmen and Florists.

Wholesale from the Manufacturers,

**CORRY & SOPER,**  
BONDED TOBACCO STORES,  
SHAD THAMES, LONDON, S.E.

Weeds Eradicated from Lawns.  
**WATSON'S LAWN SAND** both destroys  
Daisies, Plantains, Rib-grass, &c., and invigorates the  
grass. Testimonials and instructions on application. 36s. per  
cwt.; 56 lb. kegs, 19s.; 28 lb. tins, 10s.  
Proprietor, W. D. BARBOUR, 3, Park Row, Leeds.

**WEEDS, AND HOW TO DESTROY THEM.**—Gentlemen can have the Weeds, Moss, &c.,  
Destroyed on their Garden Walks, Carriage Drives, &c., without  
disturbing the gravel, by watering them with a solution of  
**SMITH'S WEED KILLER**, a liquid preparation destructive  
to all vegetable growth. It merely requires mixing with cold  
water, and is applied with an ordinary watering-can. Four  
gallons of the concentrated solution make 100 gallons of Weed  
Killer. Price 7s. 6d., carriage paid to any railway station.  
References and particulars on application to the Manufacturer  
and Proprietor, **MARK SMITH**, Operative Chemist, 8, Mercer  
Row, Louth, Lincolnshire.

**GISHURST COMPOUND.**—  
Used by many of the leading Gardeners since 1859,  
against Red Spider, Mildew, Thrips, Greenfly, and other Blight,  
in solutions of from 1 to 2 ounces to the gallon of soft water, and  
of from 4 to 16 ounces as a winter dressing for Vines and Fruit  
Trees. Has outlived many preparations intended to supersede it.  
Sold Retail by Seedsmen in Boxes, 1s., 3s., and 10s. 6d.  
Wholesale by **PRICE'S PATENT CANDLE COMPANY**  
(Limited).

**"EUREKA" FUMIGATORS**  
are the best and cheapest for all  
purposes. May be had from all Seedsmen,  
&c., 2s., 2s. 6d., 4s. 3d., 6s. 6d. each,  
package extra. TOBACCO CLOTH, 100d.  
per pound. SEED DRILLS, CAP  
GLASSES, SYRINGES, &c. LISTS free.  
SYERS, Bowdon, Cheshire.

**PETTIGREW'S STRAW HIVES.**—  
Large well made Hives, of very superior workmanship, as  
supplied to Mr. Pettigrew, at moderate prices. Catalogues of  
Hives and Appliances for the Apiary, post-free.  
**SAMUEL YATES**, Seed Merchant, 16 and 18, Old Millgate,  
Manchester.

**ANDERSON'S RUSSIA MATS,**  
For COVERING, TYING, and PACKING,  
are highly recommended for durability and cheapness. Descriptive  
Catalogue sent post-free on application. SACKS and  
BAGS of every description. TARPAULINS, HORSE-  
CLOTHS, ROPES, LINES, and TWINES.—**JAMES T. ANDERSON**, 149, Commercial Street, Shoreditch, London, E.

the writing cannot be effaced, and remains discernible at all  
times. For sample and price apply to the Manufacturers,  
**FISHER, CLARK AND CO., Boston.**

**Hurry's Daisy and Weed Extractor,**  
FOR LAWNS.

No one possessing a Lawn should be without this wonderfully  
useful little Invention.

(See the *Gardeners' Chronicle* of August 2, 1879.)

Directions for Use:—

The "Extractor" should be used as early in the year as  
possible, in the following manner:—Place the tool over crown  
of weed, and with a slight twist extract it. The plugs so raised  
discharge themselves (second pushing out first), and should be  
replaced UPSIDE DOWN while still fresh. The weed will die,  
and the grass grow better where this has been done. In using  
mowing machine after "Extractor" the box should be left  
off as much as possible, and the grass afterwards well rolled.  
If these instructions are carried out any lawn may be effectually  
freed from the obnoxious Plantain and Daisy roots which so  
often offend the eye. Lawn grass should always be kept short, to  
avoid the weed seeding.

To be obtained of all Ironmongers and Florists. Price 3s. 9d.  
only. In Polished Wood, fancy handle, 4s. 6d.

MAW AND CO., Benthall Works, Broseley, Shropshire.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS  
are made in materials of great durability. The  
plainer sorts are specially  
suited for KITCHEN  
GARDENS, as they har-  
bour no Slugs or Insects,  
take up little room, and,  
once put down, incur no  
further labour or expense,  
as do "grown" Edgings, consequently being much cheaper.

GARDEN VASES, FOUNTAINS, &c., in Artificial Stone,  
very durable and of superior finish, and in great variety of design.  
F. ROSHER AND CO., Manufacturers, Upper Ground  
Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.;  
Kingsland Road, E.

Agents for LOOKER'S PATENT "ACME FRAMES,"  
PLANT COVERS, and PROPAGATING BOXES; also  
for FOXLEY'S PATENT BEADED GARDEN WALL  
BRICKS.

Illustrated Price Lists: free by Post. The Trade supplied.

FOR SALE, a quantity of Staging Green  
BAIZE, &c. To be sold cheap. Terms on application to  
J. T. ROFE, Broomfield Nursery, Enfield.

IMPROVED GREENHOUSE GAS  
BOILER.—From numerous experiments, a Copper  
Laminated Gas Hot-water Generator has been produced and  
thoroughly tested. It obviates a fault that usually occurs in  
Boilers heated by gas, viz, the passing away of the heat  
through the flue with only imparting a small portion to the water,  
Price, with Pipes, &c., complete for standing in place, £5 10s.  
G. P. MARSHALL, Engineer, &c. Temporary Office—  
St. Mark's Buildings, Leonard Square, Finsbury, London, E.C.  
Works—32, Trevillee Street, Plymouth.

By Royal Letters Patent.

RITCHIE'S GAS LIGHTING  
and HEATING APPARATUS.

No Flue required. Specially adapted for Drying  
Newly-built Houses. Silver Medal awarded in  
1878 at Wolverhampton Exhibition. The detri-  
cious and unpleasant vapours arising from the  
burning of ordinary coal gas are prevented from  
escaping, and are made to circulate within the  
Apparatus or Stove in such a way that they be-  
come thoroughly condensed, and are carried off in  
the form of a liquid, in which will be found the  
sulphur and other poisons which are drawn from  
and would in the ordinary way be left in and  
mixed with the surrounding atmosphere. Conse-  
quently health is not prejudicially affected, Works  
of Art, Plants, Pictures, Books, Furniture, &c.,  
are not injured, and the atmosphere is rendered  
uncontaminated and perfectly healthy.

Prices from 50s. to £10 10s.

Full particulars and testimonials forwarded on  
application to RITCHIE AND CO., 23, St.  
Swathin's Lane, London, E.C.

JONES'S PATENT "DOUBLE L"  
SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle  
Boiler, with the following improvements—viz., the water-space  
at back and over top of saddle increase the heating surface to  
such an extent that a "PATENT DOUBLE L SADDLE  
BOILER" will do about twice the amount of work with the same  
quantity of fuel; the cost of setting is also considerably reduced,  
and likewise the space occupied; at the same time these Boilers  
are simple in construction, and being made of wrought-iron are  
not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 in.	18 in.	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1000	16 0 0
24 "	24 "	48 "	1400	20 0 0
28 "	28 "	60 "	1800	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Balham Hill, S.W.,  
May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial  
at my Nurseries, I beg to say that they are most satisfactory.  
I consider them the best in use, and without doubt the most  
economical of all boilers; they will burn the refuse of other  
tubular boilers I have in work."

PRICE LISTS OF HOT-WATER PIPES and CONNec-  
TIONS, with Boilers, of all sizes and shapes; or ESTIMATES  
for HOT-WATER APPARATUS, erected complete, will be  
sent on application.

129, LONDON ROAD, SOUTHWARK, S.E.

**HILL AND SMITH'S BLACK VARNISH**  
Oil Paint No Longer Necessary.  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.  
Sold in casks of about 30 gallons each, at 1s. 6d. per gallon at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

**UNSOLICITED TESTIMONIAL.**  
"Pierrefield Park, June 21, 1876.—Sirs,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

**CAUTION.**—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H & S's Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.  
Large Illustrated CATALOGUE of Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to  
**HILL and SMITH**, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 180, Buchanan Street, Glasgow.

ADVICE to a WIFE on the MANAGEMENT of her own HEALTH, and on the Treatment of some of the Complaints incidental to Pregnancy, Labour, and Suckling. By PVE H. CHAVASSE, F.R.C.S. J. AND A. CHURCHILL, London, and all Booksellers.

IMPORTANT NOTICE.—Advertisers are cautioned against having Letters addressed to INITIALS, or to FICTITIOUS NAMES, at Post-offices, as Letters so addressed are not taken in, but are sent at once to the Returned Letter Office.

SUB-MANAGER.—Required, the services of a really competent Man, as Sub-Manager: he must have a thorough knowledge of Plants, and be quite able to give advice on any subject connected with Horticulture; must also understand the value of Fruits, Plants, Seeds, &c., and all kinds of Garden Requisites. To a person of ability and good address, whose character will bear the strictest investigation, a liberal salary will be given.—Apply, by letter only, to Mr. JOHN WILLS, General Manager, The General Horticultural Company (John Wills), Limited, Warwick House, 142 and 144, Regent Street, W.

MESSRS. BECKWITH AND SON are in WANT of an energetic MAN, to take the charge of the Stove Department in their establishment.—Apply in the first place by letter, stating qualifications, age, wages expected, and where last employed. Messrs. B & S. also REQUIRE a young Man as FOREMAN, for a Provincial Nursery, where a General Collection of Soft-wooded Plants are Grown. Preference will be given to a man accustomed to Growing for Covent Garden Market.—Tottenham Nursery, London.

Gardener and Portress Wanted.

THE BOARD of MANAGEMENT of the BRENTWOOD SCHOOL DISTRICT intend, at the Meeting to be held on the 4th of June next, proceeding to the appointment of a GARDENER and PORTRESS for the District Schools, Brentwood, Essex. Preference will be given to a married couple without children. Salary, £30 per annum for the Man, and £10 per annum for his Wife; with furnished lodge, rations, and washing. The man must be able to Train the Boys in practical Gardening. For particulars of duties apply to the SUPERINTENDENT of the Schools. Applications must be made upon Forms to be obtained at my Office, to be returned not later than Wednesday the 26th day of May instant, endorsed "GARDENER and PORTRESS."—By Order, ROBERT CLAY, Clerk. 213, Kingsland Road, London, E.—May 7, 1880.

To Market Gardeners.

WANTED, a thoroughly experienced MAN, to take the entire charge of a Market Garden of six acres, quarter of an acre of Glass. Only those who thoroughly understand their work in all its branches will be entertained.—Apply, in first instance, by writing only, and state full particulars of past experience, age, salary required (no house or perquisites, nothing but money), &c., to W. WHITELEY, Universal Provider, Westbourne Grove, W.

Nursery Foreman and Manager.

WANTED, for a small Nursery, an experienced MAN, well up in all branches, but especially in Rose Growing, indoors and out. Full staff. Liberal wages and every encouragement given to a competent man.—Address, with fullest particulars, A. B., Gardeners' Chronicle Office, W.C.

WANTED, a SINGLE-HANDED GARDENER—one who has had experience in the growth of Melons and Cucumbers, Stove Plants, the Rearing and Management of Hudding-out Plants, &c. Unexceptionable references required.—Address, stating age, wages, &c., to C. D. A. Steel & Jones, Advertising Agents, Spring Gardens, S.W.

WANTED, a SINGLE-HANDED GARDENER.—Experienced in both Flower and Kitchen Gardening, in the Cultivation of Vines, Cucumbers, and Melons, and the Management of a Greenhouse.—Apply by letter, stating age, length of service in last situation, wages required, and full particulars, to R. W. ROBERTS, Esq., Hill Side, Worcester Park, Surrey.

WANTED, a young man as UNDER GARDENER or UNDER FORESTER, with a Bass Voice. Accustomed to Sing in a Choir. A fair knowledge of Music is required. Churchman.—R. B. BARRETT, Camserney Cottage, Aberfeldy, N.B.

WANTED, a thorough practical MAN, well up in Growing all good Plants for Covent Garden. Also a Junior Hand, who has had good experience in the Market Work.—F. BAKER, Plumstead Nursery, Kent.

WANTED, a WORKING FOREMAN, (married, without encumbrance), to take the lead of a staff of men for an Outdoor Fruit and Vegetable Department for Market. Must be well versed in Budding and Grafting of Fruit Trees. Also a FOREMAN PROPAGATOR (single), of Roses, &c., and the growing of all kinds of Soft-wooded Plants required for Market purposes. Good references indispensable.—Address, stating wages, WILLIAM DEEDMAN, Titchfield, Hants.

WANTED, IMMEDIATELY, a NURSERY FOREMAN, PROPAGATOR, and PLANT GROWER, in the Provinces.—Particulars at 2, Albion Villas, Northumberland Park, Tottenham, London.

WANTED, an active MAN, well up in Growing Plants and Cut Flowers. Market Grower preferred.—State wages, &c., to DAVID ANDERSON, Teddington Nursery, S.W.

WANTED, a Married FOREMAN, about 30 years of age, for the Outdoor Department of a large Private Garden. Must be experienced, and of good moral character.—GEORGE STANTON, Park Place, Henley-on-Thames.

CHARLES SHARPE AND CO., Sleaford, will have a VACANCY for a HEAD SHOPMAN on June 1.—One who has been engaged in the Country Trade and acquainted with a Country Business will be preferred.

WANTED, an ASSISTANT, in a Florist and Seed Shop.—Must be well recommended and a fair Penman.—F. AND A. SMITH, West Dulwich, S.E. Cowman.

WANTED, a respectable young man, as COWMAN, to look after Poultry, and assist in Garden. Good character indispensable.—Apply to P. BICKNELL, Esq., Foxgrove, Beckenham, Kent.

WANT PLACES.

IMPORTANT NOTICE.—Advertisers are cautioned against having Letters addressed to INITIALS, or to FICTITIOUS NAMES at Post-offices, as Letters so addressed are not taken in, but are sent at once to the Returned Letter Office.

JOHN COWAN, The Vineyard and Nursery, Garston, can with every confidence recommend a GARDENER (married, without family), to any Nobleman or Gentleman requiring the services of a highly accomplished and thoroughly trustworthy man.

LANDSCAPE GARDENER, GARDEN ARCHITECT, &c.—Age 39; twenty years' experience. Understands surveying, and can furnish plans and specifications for any class of Horticultural Erections, including the Arrangement of Hot-water Apparatus, &c. Thoroughly conversant with the Nursery Trade in all branches. Near London preferred.—26, Peckham Grove, Camberwell, London, S.E.

GARDENER (HEAD).—Married, no children.—Thoroughly practical; steady and industrious. Highly recommended by former employers.—J. MACDOUGALL, 2, Leverton Place, Kentish Town Road, N.W.

GARDENER (HEAD), where three or four are kept.—Age 28; good experience in all branches. Highest references.—R. W., The Gardens, Balcombe Place, Hayward's Heath, Sussex.

GARDENER (HEAD).—Age 44; thoroughly efficient, having had nearly twenty-two years' experience in the Management of large Establishments. Nearly four years in present situation.—J. SPAVEN, Springfield Gardens, Ulverston, Lancashire.

GARDENER (HEAD).—H. BENHAM, Head Gardener to the Earl of Stradbroke, Henham Hall, Wrangford, can with confidence recommend his Foreman, G. Eden, to any Lady or Gentleman requiring a good practical man. Address as above.

GARDENER (HEAD).—Understands Vines, Melons, Cucumbers, &c.; fifteen and a half years' character—eight years as Head Gardener. Death cause of leaving last situation.—GARDENER, Sissinghurst Place, Staplehurst, Kent.

GARDENER (HEAD).—Age 32, married, two children; well up in all branches. Two years and six months in last place. Satisfactory reasons for leaving. Good character.—GEO. FERRETT, 24, Oxford Cottages, Oxford Road, Reading.

GARDENER (HEAD), where several men are kept.—Age 39, married; twenty-six years' practical experience in the Cultivation of Vines, Pines, Peaches, Cucumbers, Melons, Stove and Greenhouse Plants, and Flower and Kitchen Gardening. Twelve years' excellent character.—R. H., 1, Exbourne Place, Abingdon, Berks.

GARDENER (HEAD), to any Lady, Nobleman, or Gentleman requiring a thorough practical man in every department.—Age 35, married, one child. Has lived in some of the best gardens in England. Understands the management of men. Excellent references.—A. Z., Royal Nurseries, Ascot.

GARDENER (HEAD).—H. T. BOULTBEE, Esq., wishes to recommend his Head Gardener to any Nobleman or Gentleman requiring a good Gardener. Understands Forcing all kinds of Fruits, Flowers, and Vegetables. Has been with me for thirteen years; leaving through reduction of establishment.—F. SOUTHAM, Springfield, Knowle, Birmingham.

GARDENER (HEAD, WORKING).—Married; thoroughly understands the profession in all its branches. Good character.—W. PEPPER, Chatterton Road, Bromley Common, Kent.

GARDENER (HEAD, WORKING); age 29, married.—A GENTLEMAN wishes to recommend the above as a thorough practical man in the various branches of the profession, strictly sober and trustworthy.—GARDENER, Gilling Lodge, Haverstock Terrace, Haverstock Hill, N.W.

GARDENER (HEAD, WORKING).—Age 39, married, two children; understands the profession in all its branches. Land and Stock if required. Twenty years' experience. Two years and a half good character.—C. W., 5, Chestnut Terrace, Forest Gate, near Stratford, Essex.

GARDENER (HEAD, WORKING).—Age 33, married; a thorough competent man. Twenty years' practical experience in all branches of Gardening. No single-handed place accepted. Highly recommended. State wages, &c.—J. BRISTOW, Perran-ar-worthal, Cornwall.

GARDENER (HEAD, WORKING), thoroughly practical and energetic; first-class Grower of Grapes, Peaches, and other fruits, Orchids, Stove and Greenhouse Plants; well understands the Management of Gentlemen's Gardens, also Land and Stock. Wife Dairy and Poultry if required. Twenty-five years' experience. Good reference.—T. MULLIS, Upper Brailles, Shipston-on-Stour, Warwickshire.

**GARDENER (HEAD, WORKING)**, where one or more are kept—Middle-aged, no family; thoroughly practical. Five years' character. No objection to the care of Cows and Meadow Land.—H. C., 2, Aseat Terrace, Ascot, Berkshire.

**GARDENER (HEAD, WORKING)**.—Age 30; understands Early and Late Forcing of all kinds of Fruit, Flowers, and Vegetables; also Flower and Kitchen Gardening. Good recommendation from last and previous employers.—S. W., 6, Cromwell Terrace, Birkbeck Road, Upper Holloway, N.

**GARDENER (HEAD, WORKING)**.—WILLIAM ELDING, having spent fifteen years in gathering practical experience in all branches of the profession, begs to offer his services to any Lady or Gentleman requiring a thoroughly practical Gardener. He would give security to manage on the most approved and economical system any establishment that might be entrusted to him. Has the honour of being recommended by the Dowager Marchioness of Huntley, and the Honourable J. T. Gathorne Hardy, also their Head Gardeners, under whom he has been Foreman.—16, Stamford Road, Fulham, London, S.W.

**GARDENER (HEAD, WORKING, or SINGLE-HANDED)**.—Married. Understands Gardening in all its branches. Three years' good character.—Apply, stating wages and particulars, to F. W., West End, Wormley, Herts.

**GARDENER (HEAD, or SINGLE-HANDED)**.—Age 40, married. Well recommended. Experienced in Vines, Melons, Cucumbers, Greenhouse, Flower and Kitchen Gardening, Land and Stock. Four years' good character.—S. HARDY, Lea Bridge Road, Leyton, Essex.

**GARDENER (HEAD, or good SINGLE-HANDED)**.—Age 26; has a good knowledge of the profession in all its branches, gained in good establishments. Good references from last and previous employers.—A. S., 23, Pomona Place, King's Road, Fulham, London, W.

**GARDENER (HEAD, or UNDER)**.—Age 35, married, respectable; thoroughly understands Gardening in all its branches, having many years' experience. Good first-class testimonials for honesty, sobriety, truthfulness and industry.—F. BROWN, 11, New Wood Street, Kidderminster, Worcestershire.

**GARDENER**.—Age 23; experienced. Good references.—M. BANNELL, Ashwick, King's Lynn, Norfolk.

**GARDENER**, where Flowers are grown with great spirit for market or private work.—Age 26; ten years' experience.—C. N. M., 31, Albert Street, Islington, N.

**GARDENER**.—Age 24; thoroughly understands his work. Three and a half years in present situation. Please state wages.—C. BATTERS, East Kirkby, Spilshy.

**GARDENER**, in a good establishment.—Age 21; two years' experience in the Houses. Three years' good character. Near London preferred.—J. PRETTY, Easton, Winchester, Hants.

**GARDENER**, under a Foreman, in the Houses.—Age 22; five years' experience indoors and out. Premium would be paid if required. Well recommended.—JOHN SEAR, Steeple Claydon, Bucks.

**GARDENER (good SINGLE-HANDED, or where another is kept)**.—Age 23; understands Stove and Greenhouse Plants, Fruit, Flower and Kitchen Gardening. Two and a-half years' good character.—F. C., Doods Road, Reigate, Surrey.

**GARDENER (good SINGLE-HANDED, or where another is kept)**.—Age 25, single; understands Orchard, Stove, and Greenhouse Plants, Vines, Cucumbers and Melons, and Flower and Kitchen Gardening.—E. B., 22, Chancellor Road, West Dulwich, S.E.

**GARDENER (good SECOND, or SINGLE-HANDED)**.—Age 24; thoroughly experienced in all branches. First-class references from present employer.—F. A., The Gardens, Hall Place, Maidenhead, Berks.

**GARDENER (SECOND, or SINGLE-HANDED)**.—Age 28, married; understands Vines, Peaches, Melons, Flower and Kitchen Gardening. Good character.—L., 4, Shades, Todmorden, Lancashire.

**GARDENER (SECOND)**, to assist in the Houses or Outdoors.—Age 22; eight years' experience. Good character.—W. THOMAS, 10, Kirk's Place, Rhodeswell Road, Limehouse, Middlesex.

**GARDENER (SECOND)**, where three or four are kept.—Age 20; has a good general knowledge of his duties. Good character.—W. B., White Webbs, P. G., Enfield.

**GARDENER (or UNDER)**.—Age 45; good references.—HENRY POWLES, 76, Eign Street, Hereford.

**GARDENER (UNDER)**.—Age 24; twelve months in last place.—W. FORTNER, 6, Alma Cottages, Beckenham, Kent.

**GARDENER (UNDER)**, in a good Garden near London.—Age 18; total abstainer. Good character.—J. GILKS, The Gardens, Loxford Hall, Hford, Essex.

**GARDENER (UNDER)**.—Age 18, respectable; six years' good character.—L. LOVEGROVE, Kilwood, Fygate, near Horsham, Sussex.

**GARDENER (UNDER)**.—Age 20; two years' good character. Near London preferred.—R. T. F., 19, Adelaide Gardens, Ramsgate.

**GARDENER (UNDER)**, in a Gentleman's establishment.—Age 25; six years' experience, indoors and out. Good character.—W. B., 11, Lock's Lane, Mitcham, Surrey.

**GARDENER (UNDER)**.—Age 19, respectable; used to Glass and Outdoor Work, the former preferred. Four years' good character.—JOHN TAYLOR, Cuckfield Vicarage, Sussex.

**GARDENER (UNDER)**, where he can improve himself in the Houses, in a Gentleman's establishment.—Age 18; two years' good character.—E. W., Cob Down, Ditton, near Maidstone.

**FOREMAN**, in the Houses, near London preferred.—Age 25; ten years' good experience in the profession. Good character from present and previous employers.—B. G., The Gardens, Winslade Park, near Exeter.

**FOREMAN**, in the Houses, in a good establishment.—Age 24; first-class testimonials from present and previous employers.—F. ORCHARD, The Gardens, Warham Court, Horsham, Sussex.

**FOREMAN**, in a Nobleman's or Gentleman's establishment.—Age 24; understands Stove and Greenhouse Plants, Vines, Peaches, Melons and Cucumbers. Good character.—A. B., Mr. Young, 1, High Street, Fulham, S.W.

**FOREMAN**, in a good establishment.—Age 23; nine years' experience in all branches. Good references.—A. B., Mr. Higgs, East Horsley, near Leatherhead, Surrey.

**FOREMAN**, in a Nobleman's or Gentleman's establishment.—Age 27; understands Vines, Pines, Peaches, Cucumbers, Melons, Stove and Greenhouse Plants, Flower and Kitchen Gardening. Three and a half years' character.—G. T., Limbo Lodge, near Petworth, Sussex.

**FOREMAN**, in the Houses, in a good establishment.—Age 23, single; understands Forcing Grapes, Melons, Cucumbers, Stove and Greenhouse Plants. Two years' good character from last situation.—State wages, &c., C. DUMPER, Church Lane, Highfield, Southampton.

**FOREMAN**, in the Houses, or GENERAL, in a good establishment.—Age 23; ten years' practical experience in first-class places, two in present. Mr. HATHAWAY, Gardener to Right Hon. the Earl of Lathom, will be pleased to recommend the above to any Gardener.—Mr. HATHAWAY, The Gardens, Lathom House, near Ormskirk.

**FOREMAN (or SECOND)**, in a large establishment.—Age 24; good knowledge in all branches of the profession. Highly recommended for industry and ability. Abstainer. Good testimonials.—W. L., 4, Inglis Road, Addiscombe, Croydon.

**FOREMAN (or good SECOND)**.—Age 23; eleven years' good experience indoors and out. Good references.—M. STANDING, West Tarring, Worthing, Sussex.

**KINAHAN'S LL WHISKY.**

**KINAHAN'S LL WHISKY.**

"By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—Civil Service Gazette.

**JAMES EPPS AND CO., HOMOEOPATHIC CHEMISTS.**

**"OLD DR. JACOB TOWNSEND'S"**

**SARSAPARILLA.**

**THE BLOOD PURIFIER.**

This extraordinary Medicine has a singular influence upon the blood, which it enriches and purifies. It removes all pimples and blotches, purifies the system, and acts like a charm. As a sustaining and purifying tonic it is invaluable, and highly recommended in long-standing cases of indigestion, nervousness, coughs, colds, scrofula, gout, dropsy, and wasting of flesh. Sold by all druggists. Caution.—Get the red and blue wrapper, with the Doctor's head in the centre. No other genuine. In bottles, 2s. 6d., 4s. 6d., and 11s.—131, Fleet Street, E.C.

**DINNEFORD'S MAGNESIA.**

The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for

**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION,**

and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**

**HOLLOWAY'S OINTMENT and PILLS.**

—On the mothers of England devolves much and serious responsibility in securing for their daughters robust health; frequently, alas! thoughtlessly sacrificed by culpable bashfulness at a particular period of life, when all-important changes take place in the female constitution, upon the management of which depends future happiness or misery. Holloway's Pills, especially if aided with the Ointment, have the happiest effect in establishing those functions upon the due performance of which health and even life itself depend. Mother and daughter may safely use these powerful deobstruent remedies.

# "THE COVENTRY" LAWN MOWER

(REGISTERED). MANUFACTURED BY

## NETTLEFOLD & SONS,

54, HIGH HOLBORN, LONDON, W.C.

The attention of the Public is invited to "THE COVENTRY" LAWN MOWER, which can be confidently recommended as the best and cheapest in the market; for lightness and ease in working it cannot be surpassed.

It has all the improvements which have of late been introduced into this class of Machine, either in England or America.

It will cut wet or dry grass of any length, will turn in its own width, and is so light that a lady can use a 15-inch Machine of this make with greater ease than a 10-inch of the ordinary kind.

It is cheaper than any other Machine of its class before the public.

It is made, as its name implies, at Coventry, by skilled English workmen, and of best English Steel and Iron.

These Machines can also be supplied with rollers at same price, and with Grass Boxes at a small extra cost.

TWO GOLD MEDALS  
Awarded to us by  
Royal Horticultural Society,

At the Grand Show at Preston,  
July, 1878,  
Out of Fourteen Competitors.

Having extensive works, special machinery, and first-class workmen, who have been many years in the trade, we are able to supply the very best class of buildings at an extremely low price. As we are the only firm in the kingdom that has ever been awarded Two Gold Medals by the Royal Horticultural Society, this will be some proof of the quality of our productions.

Our buildings are constructed so as to combine great strength, simplicity, and durability, with extreme lightness, and being made of the very best materials, will, with ordinary care, last

a lifetime. The ventilators at top and bottom open the whole length with one handle to each series. The glass used is 21-oz. British sheet, and the paint the best genuine white lead and oil.

HEATING APPARATUS, with thoroughly reliable Boilers supplied and fixed in the most practical and efficient manner, and guaranteed to work economically and answer its purpose in all seasons. We devote special personal attention to this branch of our business, and have never had a failure.

Plans, Estimates, and Catalogues free. Customers waited on in any part of the Kingdom.

of all this family, its heads of flowers are so large as to be very useful for Cut Flowers, and for the rockery or borders. A gem. Post-free, 1s. each, 10s. dozen, £3 10s. per 100. The Home for Flowers, Swanley, Kent.

SALES BY AUCTION.

Established and Imported Orchids. MONDAY NEXT.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at the Mart, Tokenhouse Yard, E.C., on MONDAY next, at 12 o'Clock precisely, 430 lots of ESTABLISHED ORCHIDS from various private collections, for unreserved Sale.

Cattleya Mossie.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at the Mart, Tokenhouse Yard, E.C., on MONDAY, May 24, an importation of CATTLEYA MOSSIE, in variety, just arrived from South America, in excellent condition.

Hornsey, N.

TWELFTH ANNUAL BEDDING PLANT SALE. IMPORTANT UNRESERVED SALE of about 80,000 unusually well-grown GREENHOUSE and BEDDING PLANTS, in rich assortment, consisting of Verbenas, Fuchsias, Heliotropes, 25,000 choice Geraniums, the whole of which are wintered plants, including Mrs. Pollock, Madame Vaucher, Vesuvius, and other well-known varieties; 10,000 Lobelias, 4,000 Calceolarias, 5,000 Alternantheras, of sorts; choice Roses in pots, Spiræas, Pelargoniums, Fuchsias, Heliotropes, &c.

MESSRS. PROTHEROE AND MORRIS will SELL the above Stock, on the Premises, The Nursery, Hornsey, N., on TUESDAY, May 25, at 12 o'Clock, by order of Mr. J. Page (successor to Mr. Cleall).

Acton.

IMPORTANT SALE of FREEHOLD PROPERTY. Dissolution of Partnership. MR. J. P. HOPE is favoured with instructions to SELL by AUCTION, at the Mart, Tokenhouse Yard, near the Bank of England, E.C., on TUESDAY, June 1, at 2 o'Clock, the very valuable FREEHOLD PROPERTY, known as the Lecture Hall, well situated in Church Road, Acton, which, being the only public hall in a parish with 15,000 inhabitants, presents an unusual opportunity of securing a first-class investment.

10,000 Odontoglossum Alexandræ, Pacho varieties. MR. J. C. STEVENS has been instructed by Mr. F. Sander, to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, May 27, at half-past 12 o'Clock precisely, an immense importation of ODONTOGLOSSUM ALEXANDRÆ, the Queen of Odontoglosses. The consignment, taking quality, size, and quantity into consideration, will be found the grandest that has ever reached this land; they were collected by Mr. C. Falkenberg in the neighbourhood of Pacho, the district for the best varieties; the plants being scarce in that locality, no expense has been spared to get this grand lot together. The importation is of an even size, few small plants being among it, and the whole are in the finest condition.

The Sale also contains a large consignment of CATTLEYA TRIANÆ, and OTHER ORCHIDS. May be viewed the morning of Sale, and Catalogues had.

Oakwood House, High Road, Tottenham. Bruce Grove Road Station, Great Eastern Railway.

MR. J. C. STEVENS will SELL by AUCTION, on the Premises as above, on SATURDAY, May 29, at half-past 12 o'Clock precisely, a small collection of STOVE and GREENHOUSE PLANTS, including a variety of Orchids, Ferns, Dracænas, Eucharis, Palms, Camellias, and Azaleas, &c.; also Geraniums, Lobelias, Calceolarias, and other bedding plants; Galvanized Hurdles, Terra Cotta Vases, Garden Lights, Fowl Coops, Beehives, and Sundries.

May be viewed the day prior and morning of Sale, and Catalogues had on the Premises, and of Mr. J. C. STEVENS, Auctioneer, 38, King Street, Covent Garden, W.C.

Masdevallia rosea.

MR. J. C. STEVENS has received instructions from Mr. F. Sander to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, May 31, at half-past 12 o'Clock precisely, a fine lot of this splendid MASDEVALLIA, described in Gardeners' Chronicle, May 1. Professor Dr. Reichenbach says:—"What is Masdevallia rosea? some of our readers may ask. Well, it is a peculiar type of Masdevallia, quite distinct from any species we have, bearing flowers of a length of 11 centimetres, the even sepals are 3 centimetres broad, of a most lovely rich rose-purple, the long tube of an exquisite purple-scarlet. Dr. Lindley sketches it:—"Flowers pink, 2 inches long, very showy." This glorious thing, so long desired, was saved from the wrecked ship, L'Ina, at St. Michael's, Azores, by our friend, F. C. Lehmann. The very few plants will appear at Mr. Stevens' Rooms to make their European debut. We hope to give soon further details and a woodcut of the queen of Masdevallias. This Masdevallia is most difficult to import, and to Mr. Lehmann's energy and skill we owe that now it is alive in Europe."

The Sale will also contain a fine lot of ODONTOGLOSSUM ALEXANDRÆ, O. VEXILLARIUM LEHMANNI, O. LUTEO-PURPUREUM, various DENDROBIUMS, CÉLOGYNES, ODONTOGLOFS, ONCIDIUMS, and other ORCHIDS. May be viewed the morning of Sale, and Catalogues had.

Highly Important Sale of Established Orchids.

MR. J. C. STEVENS has received instructions from W. Turner, Esq., Over Hall, Winsford, Cheshire, to offer for SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, June 2, and following days (instead of the days previously announced), at half-past 12 o'Clock precisely each day, without the least reserve, the entire COLLECTION of ESTABLISHED ORCHIDS. Amongst other grand things will be found Laelia Warneri, Saccolabium Turneri (spikes nearly 2 feet long), Cattleya Skinneri alba, C. Morganii, C. Wagneri, Laelia Williamsi, and many other rare and valuable plants. May be viewed the morning of Sale, and Catalogues had.

WANTED to PURCHASE, the FREEHOLD of a MARKET GARDEN or Small NURSERY, or LAND suitable for the above purpose, in a populous district, within easy distance of a large town of not less than 20,000 inhabitants.

Ireland.

TO BE SOLD, by Tender, in consequence of death of Proprietor, the Old Established PARK NURSERY, 1 mile from Wexford Railway Station. Contains 7 Acres, 2 Greenhouses, Propagating and Fern Houses, Foreman's Dwelling, also Seed Warehouse in Wexford. In full work, good connection. Farm of 15 acres, convenient, if required. Long leases. Tendere will be received and fuller particulars given by JOHN HINTON, Auctioneer, Wexford.

Grange Nursery, Heaton Mersey, near Manchester.

TO BE DISPOSED OF, by Private Treaty, Grange Villa, Heaton Mersey, with the site thereof and adjoining Land used as a Nursery, and containing together by admeasurement 14,520 square yards or thereabouts. The house comprises Dining, Drawing and Breakfast-rooms, with Kitchen, Scullery, Six Bed-rooms, Dressing-room, Water-closet, and Store-room, and is Ceilared throughout. The Outbuildings consist of Stabling for Three Horses, Coach-house and Harness-room, with large Loft and Store-cupboard, Cow-house, Piggeries, Pigeon-house, and Hen-house. There is a Greenhouse attached to the house. On the land there is erected a range of Glass 225 feet long, consisting of Vineries, Fernery, Greenhouse, and Propagating Pit. There are materials on the ground requisite for Erecting another Range of Glass, the foundations for which are already laid. There is a good Stock of Rose Trees, Shrubs, Fruit Trees, and other Plants, Flowers, &c. The Premises have for some time been used as a Nursery by the late proprietor, Mr. Thomas Studt deceased, and are replete with every convenience for carrying on the Business of a Nurseryman. The situation is healthy, and the premises command an extensive view of the Derbyshire Hills, Alderley Edge and Bowdon.

The Premises can be inspected on application at the House, and any further information can be obtained from Mr. W. R. MINOR, Solicitor, 26, Brown Street, Manchester.

Brentford, close to Station.

To FLORISTS and MARKET GARDENERS. TO BE LET, well planted GARDEN GROUND, of about 2½ acres, with Stabling, Packing Sheds, Greenhouses, Pits, Water Tanks, &c. Immediate possession can be had. For further particulars, terms, and cards to view, apply to Mr. SAMUEL GODDARD, Auctioneer, 217, High Street, Brentford, Middlesex.

Second-Hand Conservatory.

TO BE SOLD, IMMEDIATELY, all the Woodwork, Shelving, Glass and Ventilating Gear of a strong Span-roof Conservatory—size about 25 feet long, by 13 feet wide—at present attached to the mansion belonging to Duncan Graham, Esq., Lydiatt House, Willaston, near Horton, Cheshire, which must be removed at once to enable the contractors (Bennett Bros., Liverpool) to erect a larger conservatory on its site. For further particulars apply to BENNETT BROS., Horticultural Engineers, Sir Thomas's Buildings, Liverpool.

DANIELS BROTHERS,

The Royal Norfolk Seed Establishment, Norwich.

TEA SCENTED ROSES, For Planting Out or Greenhouse Culture.

Upwards of 20,000 strong, well established plants, in pots.

List and Prices on application to

CRANSTON'S NURSERY & SEED COMPANY, Limited, KING'S ACRE, near HEREFORD.

ROYAL AGRICULTURAL BENEVOLENT INSTITUTION, for the Relief of Decayed Farmers, their Widows and Orphans.

Patron—HER MAJESTY THE QUEEN. President—His Grace THE DUKE OF RICHMOND AND GORKON. ALLOWANCES to PENSIONERS. Married ... £40 per annum. Maids ... £25 " Widows and unmarried Orphan Daughters £20 " Every information to be had of the Secretary, by whom Subscriptions and Donations will be thankfully received.

ROYAL AGRICULTURAL BENEVOLENT INSTITUTION.

The TWENTIETH ANNIVERSARY FESTIVAL, in aid of the Funds of the Institution, will take place at Willis's Rooms, on THURSDAY, June 3, at a quarter to 7 o'Clock. The Right Hon. LORD CARINGTON in the Chair. Dinner Tickets 21s., application for which must be made to the Secretary.

ROYAL AGRICULTURAL BENEVOLENT INSTITUTION.

The ANNUAL GENERAL MEETING will be held at Willis's Rooms, St. James's, on WEDNESDAY, June 16, at 11 o'Clock precisely; and the ELECTION of PENSIONERS will take place on the same day, at half-past 11 o'Clock. All Subscriptions shall be deemed payable on January 1 in each year; and no Contributor shall vote in respect of an Annual Subscription while the same is in arrear. Offices of the Institution, 26, Charles Street, Haymarket, S.W.

SEEDLING PELARGONIUMS.—An

inspection of our extensive Collection of the above would well repay the trouble of a visit. F. AND A SMITH, West Dulwich, S.E.

New Japanese Azalea.

AZALEA ROSEIFLORA.—This beautiful species, which is now offered for the first time, differs from every other Azalea in cultivation. The flowers in the bud resemble those of a miniature Tea Rose, whilst as they expand they regularly imbricate like those of a Camellia. These qualities, combined with the fact that it does not fall off, render it invaluable for coat flowers, bouquets, as well as for exhibition and general decorative purposes. It is compact and free in growth, and much branched; colour deep rose-red.

First size, 6 inches high, some in flower, 10s. 6d. Second size, 6 to 9 inches high, some in flower, 21s. Third size, 1 foot high, many in flower, 31s. 6d.

WM. HUGH GOWER (Manager to the late Wm. Kollison & Son), The Nurseries, Tooting, S.W.

Now being Distributed!

WEST BRIGHTON GEM.

Unsurpassed for Winter Flowering. This has been awarded a First-class Certificate as a New Plant by the Brighton and Sussex Horticultural Society, and a Cultural Commendation by the Royal Horticultural Society. Price 10s. 6d. each, two for 20s. (usual allowance to the Trade). As the stock is limited, orders will be booked and executed in strict rotation.

For further particulars see the Times of December 17, 1879, the Journal of Horticulture of December 18, the Gardeners' Chronicle, of December 20, and for full description and CATALOGUE of Alternantheras, and other Carpet Bedding Plants, apply to

WM. MILES, West Brighton Nurseries, Cliftonville, Sussex.

MILES' HYBRID SPIRAL MIGNONETTE.

Extract from the Journal of Horticulture:—"This is the finest Mignonette that has come under our notice. It is the same variety that attracted the attention of Her Majesty the Queen, at the great Exhibition at South Kensington."

Plants of the above splendid variety, established in pots, 6s. per dozen. WM. MILES, West Brighton Nurseries, Cliftonville, Sussex.

MESSRS. THOMAS CRIPPS AND SON

are now sending out the unmentioned three new CLEMATISES, all of the viticella or Jackmanni section.—EARL BEACONSFIELD (F. Cripps & Son).—A splendid hybrid, described in the Gardeners' Chronicle, June 22, 1878, as "a beautiful flower of a rich royal purple colour, and splendid form. This variety belongs to the viticella type, and is remarkably richly coloured." First-class Certificate Royal Horticultural Society. Price 15s. each.

LILACINA FLORIBUNDA (T. Cripps & Son).—Pale grey-lilac, deeply veined; flowers the size of C. Jackmanni, but having six petals and of perfect shape. This is the lightest variety and most abundant bloomer in this section. An admirable contrast to C. Jackmanni for bedding purposes. Price 10s. 6d. each.

OTHELLO (T. Cripps & Son).—Flowers medium, a good shaped six-petaled variety. Late and very free flowering; colour dark velvety purple. Price 10s. 6d. Discount to the Trade.

Plates of "Earl Beaconsfield" and "lilacina grandiflora," 2s. 6d. each. The Tunbridge Wells Nurseries, Kent.

Cheap Plants.—Special Offer.

Manufactured by

CLAY & LEVESLEY,

174, HIGH STREET, HOMERTON, E.

HELLEBORUS NIGER, the Christmas Rose. This beautiful white flower, coming to perfection at Christmas time, is already much too little grown, being hitherto too scarce and dear. Millions of its fine blossoms should be ready for the markets in mid-winter, where only hundreds are now to be found, and would always prove the most profitable thing it is possible to grow. It requires no heat nor care. We are prepared to supply for immediate orders any quantity of fine roots at one-sixth the usual prices, and we believe that investment in them will prove the finest speculation possible. For terms apply to HOOVER AND CO., Covent Garden, London, W. C.

BEDDING PLANTS, & C.

GERANIUMS, Bedding, Zonal and Nougay, in choice sorts, our selection, 2s. 6d. and 3s. per dozen, 16s. and 20s. per 100. ## MY BEDDING PLANTS.

H. CANNELL begs to announce that he has the largest and choicest stock of Plants adapted for all kinds of outdoor garden decoration ever offered. Small lots by post, and large quantities loaded direct into railway truck.

See H. C.'s FLORAL GUIDE, sixty-nine Bed Designs, with key to same and every information, post-free for 1s.

## SEEDLINGS.

PRIMULAS, CINERARIAS, &c.

H. CANNELL begs to announce that he has probably half a million of the above. 1s. 6d. per dozen, 10s. per 100, post free.

It is needless to say that all are from my own unequalled collection, and scientifically fertilised with my own hands. Two houses (100 feet each) devoted to their culture, and during last winter they were the admiration of all. This collection was never before approached, nor such a splendid crop of seed ever obtained in England.

THE HOME FOR FLOWERS.

## FLORVITA.

THE LIFE OF FLOWERS.

For Stimulating and Quickening the Growth of Plants, and producing a rapid and high development of blossoms.

Samples, post paid, 1s. 2d. Prepared only by PRENTICE BROS., Chemical Laboratory, Stowmarket. Sold by all Chemists and Florists, in bottles 1s. and 2s. 6d. each, and in jars 18s. and 36s. each.

## WEEDS, AND HOW TO DESTROY THEM.

Gentlemen can have the Weeds, Moss, &c., Destroyed on their Garden Walks, Carriage Drives, &c., without disturbing the gravel, by watering them with a solution of SMITH'S WEED KILLER, a liquid preparation destructive to all vegetable growth. It merely requires mixing with cold water, and is applied with an ordinary watering-can. Four gallons of the concentrated solution make 100 gallons of Weed Killer. Price 7s. 6d., carriage paid to any railway station.

References and particulars on application to the Manufacturer and Proprietor, MARK SMITH, Operative Chemist, 3, Mercer Row, Louth, Lincolnshire.

**Tobacco Fibre Insecticide.**

All who have a Greenhouse and love to see their Plants look clean and healthy should use

**DARLINGTON BROTHERS' TOBACCO FIBRE**.—Contains more Nicotine than any other Insecticide sold; purer and better than the best Tobacco Paper or Cloth; easy to use; no apparatus requisite; a common garden pot only required; will not flare, is perfectly safe, and is the best article for making Nicotine Juice for syringing purposes. Forty per Cent. saved by the use of this article. Prices, 6 lb., 5s.; 28 lb., 21s. First-class ROLL TOBACCO PAPER or CLOTH, same price as above. Best Paper and Cloth made. Testimonials, free on application. Post-office Orders, Darlington Brothers, Chatham. Cheques crossed London and Provincial Bank. DARLINGTON BROTHERS, Frederick Street, Chatham.

## GISHURST COMPOUND.

Used by many of the leading Gardeners since 1850, against Red Spider, Mildew, Thrips, Greenfly, and other Blight, in solutions of from 1 to 2 ounces to the gallon of soft water, and of from 4 to 16 ounces as a winter dressing for Vines and Fruit Trees. Has outlived many preparations intended to supersede it. Sold Retail by Seedsmen in Boxes, 1s., 3s., and 10s. 6d. Wholesale by PRICE'S PATENT CANDLE COMPANY (Limited).

W. M. PETERS has still some good colour Soft ARCHANGEL MATS, very suitable for tying purposes, also ARCHANGEL and ST. PETERSBURG MATS, for covering.

JUST TO HAND, ex Duart Castle, a parcel of RAFFIA, fine quality, good colour, and extra strong.

SEED BAGS and SACKS. Specially prepared Sewing or Tying, White or Tarred TWINE, ROPES, LINES, &c. NETTING and SHADING CANVAS, RICK CLOTHS and WATERPROOF COVERS of all descriptions.

**ARCHANGEL AND PETERSBURG MAT MERCHANTS and IMPORTERS.**

All the usual kinds at reduced rates. SACKS and SEED BAGS, new and second-hand, of every description. RAFFIA FIBRE, NETTING, and TIFFANY. TARPULINS, RICK COVERS, HORSE-CLOTHS, ROPES, LINES and TWINES. Price LIST on application to J. BLACKBURN AND SONS, 4 and 5, Wormwood Street, London, E. C.

**GARDEN STAKES, LABELS, VIRGIN CORK, MATS, RAFFIA, &c.** None cheaper. Prices of WATSON AND SCULL, 90, Lower Thames St., London, E. C.

By Royal Letters Patent.

**RITCHIE'S GAS LIGHTING and HEATING APPARATUS.**

No Flue required. Specially adapted for Drying Newly-built Houses. Silver Medal awarded in 1878 at Wolverhampton Exhibition. The deleterious and unpleasant vapours arising from the burning of ordinary coal gas are prevented from escaping, and are made to circulate within the Apparatus or Stove in such a way that they become thoroughly condensed, and are carried off in the form of a liquid, in which will be found the sulphur and other poisons which are drawn from and would in the ordinary way be left in and mixed with the surrounding atmosphere; consequently health is not prejudicially affected, Works of Art, Plants, Pictures, Books, Furniture, &c. are not injured, and the atmosphere is rendered uncontaminated and perfectly healthy.

Prices from 50s. to £10 10s.  
Full particulars and testimonials forwarded on application to RITCHIE AND CO., 23, St. Swithin's Lane, London, E. C.

## X PIPES.—PIPES.—PIPES. X

F. AND J. SILVESTER, Castle Hill Foundry, Engineering and Boiler Works, Newcastle, Staffordshire.

## REDUCED PRICES.

STEVENS'

TRENTHAM GREENHOUSE BOILER.

After long experience, has proved the most SIMPLE, ECONOMICAL, EFFECTUAL, and LASTING BOILER extant; recently improved.

Sole Makers,

F. & J. SILVESTER,  
CASTLE HILL FOUNDRY, NEWCASTLE,  
STAFFORDSHIRE.

**IMPROVED GREENHOUSE GAS BOILER.**—From numerous experiments, a Copper Laminated Gas Hot-water Generator has been produced and thoroughly tested. It obviates a failing that usually occurs in Boilers heated by gas, viz., the passing away of the heat through the flue with only imparting a small portion to the water. Price, with Pipes, &c., complete for standing in place, £5 10s. G. P. MARSHALL, Engineer, &c. Temporary Office—St. Mark's Buildings, Leonard Square, Finsbury, London, E. C. Works—32, Trevilce Street, Plymouth.

## Hurry's Daisy and Weed Extractor,

FOR LAWNS.

No one possessing a Lawn should be without this wonderfully useful little Invention.

(See the Gardeners' Chronicle of August 2, 1879.)

Directions for Use:—

The "Extractor" should be used as early in the year as possible, in the following manner:—Place the tool over crown of weed, and with a slight twist extract it. The plugs so raised discharge themselves (second pushing out first), and should be replaced UPSIDE DOWN while still fresh. The weed will die, and the grass grow better where this has been done. In using mowing machine after "Extractor" the box should be left off as much as possible, and the grass afterwards well rolled. If these instructions are carried out any lawn may be effectually freed from the obnoxious Plantain and Daisy roots so often offend the eye. Lawn grass should always be kept short, to avoid the weed seeding.

To be obtained of all Ironmongers and Florists. Price 3s. 9d. only. In Polished Wood, fancy handle, 4s. 6d.

Wholesale Agent: THOMAS TILLEY, 12, Walbrook, London, E. C. Cambridge Agents: G. BEALES & CO.;

Or Carriage Free of the Inventor on receipt of P.O.O. for 4s. 3d. and 5s. 3d., payable at Cambridge or Saraton.

MR. J. C. STEVENS has been instructed by Mr. F. SANDER to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, May 27, at half-past 12 o'Clock precisely, an immense importation of

## ODONTOGLOSSUM ALEXANDRÆ—the QUEEN of ODONTOGLOTS.

The consignment, taking quality, size, and quantity into consideration, will be found the grandest that have ever reached this land. They were collected by Mr. C. Falkenberg in the neighbourhood of Pacho, the district for the best varieties. The plants being scarce in that locality, no expense has been spared to get this grand lot together. The importation is of an even size, few small plants being among it, and the whole are in the finest condition.

The Sale also contains a large consignment of

## CATTLEYA TRIANÆ and other ORCHIDS.

*May be viewed the morning of Sale, and Catalogues had.*

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN LONDON, W.C.

### NEW PATENT GRASS-CUTTERS

(PATRONISED BY THE BOARD OF WORKS).

W. CLARK, 232, Oxford Street, London, W.,

Begs to call public attention to a Patent Grass-Cutter he has just invented for use in the Garden and Farm, based upon the principle of the well known "Clark's" Horse-clipping Machine, and which is, by its lightness of construction and rapidity of action, far preferable to the existing implements in use, and supplies a want long felt by every one who possesses a garden, namely, an instrument which will mow grass where inaccessible to the lawn mower, trim grass plot edges, clip Ivy and other creepers, also shrubs and trees, and keep in order Box borders and fancy Trees, &c.; all which this ingenious little instrument is capable of doing.

It is made in three sizes, to cut in breadth 8 inches, 12 inches, and 16 inches respectively; and is so easy in working, and at the same time so effective, that even ladies can work it without feeling fatigued, there being no occasion to stoop on account of the long wooden handles attached to the machine, and a greater quantity of work can be done in a given time than by any other method.

This invention is also applicable for Farm purposes—Reaping Corn and other Crops, Clover, Rye, &c., equally as well as accomplishing the objects for which it is required in the garden; and the cost being so small in proportion to the saving in time and quality of finish effected, it is placed within the reach of all, and needs but a trial to prove its superiority.

#### PRICES.

The 8-inch Machine, complete with Rollers and Tray	.. ..	21s.
Ditto, without Rollers and Tray	.. ..	18s.
The 12-inch Machine, complete with Rollers and Tray	.. ..	28s.

**NEW PLANTS FOR 1880.**

**MR. WM. BULL'S**  
ILLUSTRATED  
**CATALOGUE FOR 1880**

Is now ready, and can be had on application.

Price 1s.

It contains Names, Descriptions and Prices, of the following New Plants:—

- ASPARAGUS FALCATUS
- .. PLUMOSUS
- BERTOLONIA VITTATA
- CRINUM AMGENUM
- CYPHOMANDRA ARGENTEA
- DIEFFENBACHIA AMENA
- .. CARDERI
- .. DELECTA
- .. LEOPOLDII
- .. SPLENDENS
- DOODIA ASPERA MULTIFIDA
- DRO-SERA DICHOTOMA RUBRA
- GENTIANA KURROO
- HETEROSPATHE ELATA
- IRIS KEMPFFERI CHELSEA HERO
- JUNCUS LÆTIVIRENS
- .. ZEBRINUS
- JUSSIEA MACROCARPA CILIATA
- LITOBROCHIA COMANS DENSE
- MARANTA NITENS
- OREODONIA GRANATENSIS
- PAYONIA MAKAYANA
- PHILODENDRON CARDERI
- PIERIS OVALIFOLIA DENSIFLORA
- POLYSTICHUM LENTUM
- .. VIVIPARUM
- SARRACENIA ATROSANGUINEA
- .. CRISPATA
- .. FLAVA ORNATA
- SELAGINELLA CAULESCENS GRACILIS
- SENECIO SPECIOSUS.

THE  
**Gardeners' Chronicle.**

SATURDAY, MAY 22, 1880.

THE ROYAL ACADEMY.

As far as flower paintings are concerned, this year's exhibition falls far short of its predecessors; in fact, there are no really first-class pictures of flowers upon the Academy walls. The whole exhibition is below the average, many well-known artists being represented by poor or small works, whilst other painters, whose pictures one annually expects to see at this Academy, are unrepresented. On the other hand, there are several very large and ugly productions which might well have been placed somewhere else than on the Academy walls.

Landscape is generally well represented at Burlington House, and this year's exhibition is no exception to the rule. One's attention is soon arrested by the beautiful landscape by Vicat Cole—15, "A Thames Backwater;" the same artist exhibits a work of similar character in 310, and another in 393—"On Silver Thames;" this latter is perhaps the best picture of the three last mentioned. Mr. Cole also sends a fourth work at 1466; all four pictures are worthy of close study on account of their grace, beauty, and fidelity to Nature. In 50 we have "I'm Going a-Milking"—Edw. H. Fahey—a picture remarkable not only for its truthful and beautiful landscape painting, but for its equally beautiful figure. Works of a similar conception have been exhibited several times before by this artist, and the pictures all display the same clear appreciation of Nature, and the same power of figure drawing. In 125 Mr. Fahey exhibits a view introducing the Pyrenees. 126, "Aloes," Edgar Hanley. This picture of plants is so near the ceiling that it is impossible to form any opinion of it; but there is a similar subject by the same artist in 1021, and a third in 1455—"Where the Oranges Ripen." In these pictures the plants are boldly and well drawn and painted, and in all the three paintings figures hold a position similar in importance with the plants. 132, "The Thistle-down Gatherer," Thos. M. Rooke—an illustration to some lines by D. G. Rossetti, in which a very ugly young (?) woman is represented gathering Thistle-down from apocryphal Thistles. The drawing is very feeble, and the colour unnatural. 238, "Eucalyptus," A. F. Mutrie, a study of *E. coccifera*, the plant illustrated in the present volume of the *Gardeners' Chronicle* at p. 395. The artist has had in this plant no opportunity of displaying her fine talent. 295, "Christmas Roses," W. J. Muckley, is a beautifully drawn and painted picture of white Hellebores. In passing on to other pictures a stay may be made to admire the magnificent night-prowling lions in 298—"The Night Watch," by Briton Riviere, and "A Desperate Venture," in 349, by Gaetano Chierici. The perfect exactness and attention to every detail in the latter picture is most remarkable, still the picture is by no means over-coloured, and it resembles Wilkie at his best in its general style. 367, "Flowers," W. J. Muckley—an excellent

group of Roses, Larkspurs, and Gladioli. Mr. Muckley has failed in his colour of the scarlet Gladiolus, simply because no artificial colour can in any way approach the splendid transparent scarlet colour seen in the living plant. 473, "Roses." II. Fantin, a group of very small Roses, and, as we think, both ill-conceived and ill-executed. According to our estimate of Roses, large or small, the blossoms here painted are weak and unnatural. Again, in 564, "Peonies," where the Peonies are represented with corn blue-bottles, the drawing appears to us to be very imperfect, and the colour, as in the last, unnatural. We question, too, whether any well-trained artist would represent a jug with its handle directly facing the spectator, so as to form an ugly upright line in the middle of the picture. 630, "Primula," Mrs. L. Haghe—a Primula in a pot with Hyacinths and Crocuses, well drawn, and though very low in tone, yet better painted than average flower subjects not amongst the first class. 639, "White Chrysanthemums," Letitia M. Parsons, a less than average production; the leaves are ill-drawn and unnatural. 657, "Memory," Wm. S. Herrick—the well-known scraggy Azalea, with naked stem and branches, in this instance growing in a brass pot with blue beads at the base. 681, "Plant of Verbascum or Mullein," Francesco Bensa, is far from being a good representation of a Mullein. 703, "Water Lilies," W. J. Muckley—a group of Water Lilies, Larkspurs, and Roses, admirably drawn and painted, as is usual with this excellent artist. 734, "Chrysanthemums," by the same. This group of single and double Chrysanthemums strikes us as being somewhat less perfect than other works from the brush of Mr. Muckley. 742, "Primulas," Grace H. Hastie, is one of the brightest little sketches of Primulas we have seen for some time. 860, "Mushrooms," Jabez Bligh, is a fairly executed drawing of a basket of *Agaricus campestris*. But how many times has this basket of Mushrooms, with one or two specimens upside down, been exhibited at the Academy? We remember the late F. Walker once exhibited a picture exactly in the same style.

When we get amongst the water-colour drawings at the Royal Academy, we have such a flood of little Azaleas, Almond blossoms (in and out of little pots and jars), sprigs of May, with robin red-breasts, bullfinches, Plums with the bloom on, and Oranges and Melons with a piece cut out, that a brief notice for one year does for ten years to come and ten years back. We fancy we have seen them all at each succeeding exhibition of the Royal Academy, since we first bought our own popular paint-box. 975, "Study of Fruit and Flowers," Edith Elmore, is a bold and somewhat rough picture, but an evident improvement on exhibited works of former years. 1029, "Reflections," Emily Mary Osborne. In this large and finished picture it would be a decided improvement to give the blooms of *Lilium candidum* six petals each instead of five. 1045, "For the Feast of the Tournament," Wm. Hughes. This is a very large and elaborate picture of fruit, exactly in the style of Lance. We have Melons, Grapes, Peaches, and Pears displayed on a piece of rich carpeting. There is also the everlasting tall Venetian glass, half full of hock, and a silver vessel on its side upon the floor. All the objects are very real looking and uncommonly well done, but it is far too like what has so many times been done before. 1448, "Double Daffodil and Azalea," Mrs. R. Marshall. We look upon this work as being very poor in drawing, and as showing no appreciation whatever of plant form. 1457, "Amber and Opal," Laura Alma-Tadema—a picture of Tulips and Daffodils, but hardly better than the last; the flowers are not well drawn, the colour is defective, and the execution is needlessly rough.

We have omitted all notice of the figure subjects, of which there are several in the Academy of great excellence, none being second to Mr. Poynter's 250, "A Visit to Æsculapius." Mr. Alma-Tadema has three pictures, but to us they are all less satisfactory than his paintings of former years; as works of art they of course take a very high place on account of their learned correctness, and beautiful and masterly execution. Of portraits there are as usual many excellent examples, whilst other pictures, as the portentous and ugly production by Mr. Val C. Prinsep of "The Imperial Assemblage," &c., would be better elsewhere. We have passed many landscapes of great beauty, but we cannot close our brief notice without reference to the magnificent picture by Mr. B. W. Leader, 1480, "A Gleam in the Storm." This work possesses all the excellencies of other pictures by this artist adverted to by us many times in former years. Its great power and evident truth to Nature is very striking.

## New Garden Plants.

MASDEVALLIA ROSEA, Lindl.

The queen of Masdevallias is a veteran. She was described as early as 1845 in the *Annals of Natural History*, xv., p. 257, by Dr. Lindley, and it was one of the discoveries made by the excellent German traveller, Theodor Hartweg. Later on it was gathered up by the late Professor Jameson, who had the honour of being an Ecuadorian *employé*, with a very homœopathic pay, dispensed with great irregularity. Though the plant had always been desired, all attempts to introduce it proved to be vain. The remote corners where the rosy beauty expands its wonderful flowers are nearly inaccessible. After all those difficulties there is the almost certain prospect of losing the plant as soon as it comes into the hot region, just as certainly as all *Telipogons* die, one only having flowered in the nursery of Messrs. Veitch, although numerous thousands were collected, mostly by Wallis and Bruchmüller. Thus Mr. Lehmann himself declares that he regards his success as a wonder, he not being sure whether the plant may prove importable a second time. It is the coolest of Masdevallias—a fact that growers may keep in memory. We shall shortly give a representation of the plant, taken from one of Mr. Lehmann's drawings. Ah! if I had time I would watch the interesting moments when Mr. C. Stevens swings his hammer over this chaste beauty. It will be one of the *jours d'honneur* of the big room. By-the-bye such days should be noted in red or golden letters behind the rostrum of Mr. Stevens, so that such dates might be kept in the memory of the orchid world. *H. G. Rehb. f.*

EPIDENDRUM BRACHIATUM, A. Rich. and Gal.\*

This plant was named and "described" by Achille Richard, the son of one of the best botanists of the world, in 1845, in the *Annales des Sciences Naturelles*, with a "diagnosis" nobody could make out. Dr. Lindley thought it was his *Epidendrum glaucum* (see his *Folia*, No. 16). If I correct him, it is because I am luckier than he was, knowing the plant from the typical specimen, not from the unintelligible "diagnosis." Hence, thirty-five years after its publication the plant is recognisable, I hope. Had Dr. Lindley or any one else described the species after A. Richard, I would, of course, not reinstall A. Richard's name, but keep the newer one, provided it was described with Lindleyan precision. Systematical botany becomes absolutely inaccessible if in our days it is regarded sufficient for the establishment of a species to scribble some lines about a thing, which may be applied to many or to no species at once.

This plant has bulbs and leaves in the way of those of *Epidendrum foveolatum*, *virgatum*, *vitellinum*, *amabile*. The ovoid, compressed, glaucous bulbs have one single glaucous, ligulate, blunt, acute leaf. The raceme bears numerous flowers, and is occasionally rather long. It has stellate flowers of a rather strong

\* *Epidendrum brachiatum*, A. Rich. Gal. Orch. Mexico, No. 40.—*Pseudobulbus* ellipticis obtuse acutiphylis monophyllis pruinatis; folio cuneato ligulato obtuse acuto spathulato pruinato; racemo elongato multifloro; bracteis triangularibus minutissimis; flore valde coriaceo; sepalis ligulatis apicularis; tepalis angustioribus, labello a media columna libero trifido, laciniis lateralibus divaricatis erectis linearibus retusis, lacina mediana rhombea, callo ligulato acuto antice nunc bidentato per unguem labelli in basin lacinae antice; columna aptera apice trifida, laciniis omnibus triangularibus; anthera depressa didyma, bene breviori. Sepala et tepala luteo flavo cinnamomeo maculata, extus albo sulphurea. Labello albo sulphureo punctis quibusdam cinnamomeis. Ex diagnosi Richardiani. No. 40. P. brachiatum. Nob. *Pseudobulbus* ovatoideis 1 phyllis, fol. oblongo elliptico acuto; floribus parvis numerosis, brunneis, paniculatis; labello albo trifido, lobis lateralibus angustis falcatis, intermedio obovato acuto. *H. G. Rehb. f.*

waxy structure, all six phyllous organs 1 centimetre long. Sepal and petals lightest yellow outside, yellow inside, with numerous cinnamon blotches. The deeply trifid lip is of the lightest yellow, with a few small cinnamon spots. The column is trifid at apex, and the unpair segment has a brown spot at its top. The plant is a botanical curiosity, and may be regarded as one of the forlorn sons returning home. Messrs. Veitch were so very kind as to send me twice very liberal supplies, adding, what must be regarded as a model action, a very good strong living plant. Wild specimens do not appear to have reached European herbaria. A. Richard's type came no doubt from a garden. There is a note quoting Oaxaca as its original place. *H. G. Rehb. f.*

## ABIES CONCOLOR.\*

GREAT have been the confusion and misunderstanding respecting the tree known in our gardens as *Abies* or *Picea* *Parsonsiana*, *Lowiana*, and *lasiocarpa*, and proportionately thankful should we be to any one who takes the trouble to unravel the complexity and evolve order out of chaos. Dr. Engelmann has done this for us in the case of the plant now before us. We proceed to quote the description given by this eminent authority, as given in the second volume of the forthcoming *Botany of California*, drawn up from native specimens, and append some remarks of our own, based on the examination of cultivated as well as of herbarium specimens.

"A. CONCOLOR, Lindl.—A large tree, 80 to 150 feet high, with a diameter of 2 to 4 feet, with rough greyish bark; leaves mostly obtuse, pale green, and with stomata on both sides, those of younger trees and lower branches elongated, 2 to 2½ and even 3 inches long, 2-ranked, often slightly channelled and notched, those of old trees and of upper cone-bearing branches shorter (1 inch long), broader, thicker, convex above and often falcate, covering the upper side of the branchlets; cones oblong-cylindrical, 3, 4, or even 5 inches long, and 1½ to 1¾ inch in diameter, pale green, or sometimes dull purplish; scales (12 to 15 lines wide) nearly twice wider than high; bracts short, enclosed, truncate, or emarginate, with or without a short mucro; wing of the seeds oblique, as long as broad; cotyledons five to seven.

"*Journ. Hort. Soc. v. 210; Engelm. Lc. 600, and Wheeler's Rep. vi. 255; Picea concolor, Gordon, Pin. 155; Pinus concolor, Engelm.; Parlat. in DC. Prodr. xvi. 2, 426; Abies Lowiana, Murr.; A. grandis of the Californian botanists; A. amabilis (?)*, Watson, Bot. King Exp. 333.

"A common Fir throughout the Californian sierras, from 3000, or 4000, to 8000 feet elevation, extending into Southern Oregon and through the mountains of Arizona to Utah and S. Colorado. Always readily recognised by the grey bark of the trunk (whence often called in California "White Fir"), and by the pale colour of the foliage, which at last becomes dull green. A very ornamental tree, especially the paler variety, but the timber is not much esteemed. A. *Lowiana*, known also in nurseries as *A. Parsonsiana*, *lasiocarpa*, and *amabilis*, distinguished by its longer, flatter, straighter leaves, with fewer stomata on the upper side, is a young and vigorous state of this species, which has not yet fruited in cultivation."

We have it then established that the plants commonly grown in English gardens under the names of *Lowiana* and *Parsonsiana*, and sometimes also under the incorrect names of *lasiocarpa*, *grandis* and *amabilis*, belong all to one and the same species, the accepted name for which is *concolor*.

*A. Parsonsiana* (*concolor*) was introduced into Britain, according to Dr. MacNab (*Gardeners' Chronicle*, vol. v., 1876, p. 76), by Jeffrey in 1851, under the name of *grandis*, and plants of this origin are growing in the Edinburgh Botanic Garden. "In its native state Jeffrey reported that it grows to a

\* *ABIES CONCOLOR*, Lindley, *Journ. Hort. Soc. v. (1850), p. 210; Engelmann, Bot. Californ. ii. p. 119; Murray, in Gard. Chron. iii. 1875, p. 105; Gard. Chron. 1880, vol. xiii., p. 19, fig. 1. PINUS CONCOLOR, Engelm. ex Parlatore, in DC. Prodr. xvi. 2, 426; MacNab, Proc. R. Irish Acad. 1876, p. 681, tab. 46, fig. 6. PICEA CONCOLOR, Gordon, Pinetum, ed. 1, 155; ed. 2, p. 216; Murray, in Gard. Chron. 1874, iv. 1875; 1876, in Gard. Chron. 1876, iii., 1875; Murray, in Gard. Chron. iii. 1875, p. 454 (var. *violacea*). PICEA PARSONSIANA, Barron, Cat. 1860; Parsons, in Gard. Chron. vol. v., 1876, 45. Barron, Gard. Chron., vol. v., 1876, p. 77; MacNab, p. 78. PICEA LOWIANA, Gordon, Pinet. Suppt. (1862) ed. 2, p. 218; Fowler, in Gard. Chron. 351, 1872; MacNab, Proc. R. Irish Academy, 1876, p. 681, tab. 46, fig. 5; Low, in Herb. Kew. PICEA SEU ABIES LASIOCARPA, hort. Angl.; Murray, in Gard. Chron. 174, iv., 1875; haud Hook, Lindl. et Gard., *Falfour*, nec Jeffrey. PICEA SEU ABIES GRANDIS, hort. quorund. Lobb, in Herb. Kew, nec Lindl., nec Douglas. PICEA SEU ABIES AMABILIS, hort. quorund., nec Douglas.*

height of 288 feet, with a stem 15 feet in circumference." Very few plants were raised from Jeffrey's seeds, but in 1853 Mr. Parsons received seeds from California of the same species. In 1855 Mr. Stuart Low again introduced the plant into England, and submitted it to Mr. Barron, of Elvaston, who pronounced it to be "either lasiocarpa or a new species." (See Mr. Barron's letter, *Gardeners' Chronicle*, 1876, vol. v., p. 78.) By lasiocarpa Mr. Barron here means a plant so named by Prof. Balfour, and which he (Mr. Barron) determined to be identical with the grandis of Douglas (referred by MacNab, however, to *amabilis*, Douglas). In 1859 Mr. Parsons visited England and saw the plant Mr. Low had bought of him, cultivated under the name of lasiocarpa, in Messrs. Waterer & Godfrey's nursery at Woking. In this year, too, Mr. S. B. Parsons called on Mr. Barron at Elvaston, and received from him the assurance that this "tree was a new and distinct species." The name *Parsonsiana* was forthwith adopted in Barron's *Catalogue*. So published, without, as we presume, description and authentication, the name *Parsonsiana* could not be accepted in any accurately compiled register of baptisms, though no objection could have been raised and much labour and confusion would have been spared if it had been simply called Parsons' Fir, and if botanists had been left to find out, if so disposed, what exact position and botanical name Parsons' Fir should have. Even now it is not too late for those who wish to retain the name of Messrs. Parsons for a tree made known chiefly through their enterprise, to call it Parsons' Fir, but never either *Abies* or *Picea Parsonsiana*.

In 1862 Gordon published the supplement to his *Pinetum*, in which he calls this selfsame tree *P. Lowiana*, but this name, if applied erroneously in ignorance of the previously named concolor, has no more right to encumber the lists than has the preceding. These two names, then—*Parsonsiana* and *Lowiana*—must be allowed to drop. We come now to the name lasiocarpa, the one by which our present plant is, in our experience, most widely grown in this country.

Now the original lasiocarpa of Hooker, *Fl. Bor. Amer.* 2, p. 163 (1840), and perhaps also of Balfour in Jeffrey's *Seeds*, p. 1, t. 4, f. 1, is considered to be the *amabilis* of Douglas (1836), which latter is referred by Engelmann to *A. grandis* of Lindley in *Penny Cyclopaedia*, No. 3, which latter name has priority. But whether this be so or not we have it in evidence that the lasiocarpa of the Edinburgh Botanic Garden and of Balfour is not the plant which Mr. Barron called *Parsonsiana*, and so we may set aside the name lasiocarpa, at least as applied to the species before us. There remains the name grandis. The original grandis is credited to Douglas in *Comp. Bot. Mag.* 2, p. 147 (1836). Lindley, Gordon, Parlatores, Engelmann (not Carrière), all mean Douglas' plant by the epithet grandis, although they place it in different genera; but our present plant differs materially in characters from grandis, as we shall hereafter show, and therefore should not be called by the same name.

Lastly, there is *amabilis*, also credited to Douglas (1836). Douglas' *amabilis* is referred by Engelmann, with a doubt (?), to grandis of Lindley; Gordon, Carrière, and Parlatores keep it distinct, and Gordon and Parlatores refer to it as Hooker's lasiocarpa. Now our present plant is not the grandis of Lindley, neither is it Hooker's lasiocarpa. It forms no part of our present purpose to disentangle the horrible confusion between the plants above-named. In what we have said we have followed Engelmann, who is at variance as to synonymy with his predecessors. Our only object, however, is to establish the position of the particular plant before us. If, then, the names grandis, *amabilis*, and lasiocarpa do not—and we believe they do not—properly apply to this species, what shall we call it? By a process of elimination we seem to be reduced to two, *Lowiana* and *Parsonsiana*; but, as we have seen, *Lowiana* is out of court by virtue of the law of priority, and *Parsonsiana* has only the dignity of a catalogue name. It is a name and a name only. Still we should feel bound to adopt it, and to do our best to justify its admission were it not for the circumstance that, according to Engelmann, the plant in question is to be referred to *Abies concolor* of Lindley, *Journ. Hort. Soc.* v. (1850), p. 210, and our own comparative observations lead us to adopt the same conclusions.

*A. concolor* differs from *A. grandis* of gardens in its

long, straight, soft, leathery looking leaves, which are usually considerably longer (sometimes 2 inches long), distinctly channelled on the upper surface, similar in

nearly if not quite distichous, and those on the upper are not materially shorter than those on the lower surface of the branch.

In *A. grandis*, as generally so called in this country, the leaves are shorter, 1 to 1½ inch, dark shining green, less deeply channelled, and with no stomata on the upper surface. The under surface, however, is more or less glaucous blue, with lines of stomata. The apex of the leaf is more deeply and widely notched. The uppermost leaves on the lateral branches are not much more than half the length of those beneath.

With reference to the difference between concolor and grandis, Murray writes that before having seen grandis growing wild in its native country he should have considered it and concolor as distinct species, but from the great amount of variation he witnessed in grandis he considered (see *Gardeners' Chronicle*, January 23, 1875) that concolor is only a "marked variety" of grandis. The whitish colour of the leaves is a common attribute of grandis in Utah, while the falcate leaves, also relied on as a distinguishing mark of concolor, also occur in grandis. The cones of the two are identical, while the bracts are also not distinguishable. A very great amount of variation was also observed by Murray in habit, length, and colour of leaf, &c., even in the case of plants growing side by side.

Syme, *Gardeners' Chronicle*, May 1, 1875, p. 563, is of the opinion that concolor and lasiocarpa and *Lowiana* are distinct. In concolor the upper surface of the leaves is studded with stomata; in lasiocarpa only a central band is so provided; grandis is entirely destitute of stomata on the upper face. In concolor var. *violacea* the leaves are bluish-white, instead of pale green, as in lasiocarpa, and the seed-leaves are 5-7, in place of 6-8, as in lasiocarpa.

We may now allude to the position of the resin-canals. In *A. concolor* (type specimen) we find the resin canals as figured by MacNab (*Gardeners' Chronicle*, August 14, 1875, p. 194, fig. 38), and in living specimens of so-called *Lowiana* from Mr. Mackay we find precisely the same arrangement.

The leaves of grandis, as cultivated, have the same arrangement as that figured by MacNab, *l.c.*

The arrangement of the resin canals in *P. lasiocarpa*, Hook. type, is, according to MacNab, quite different from those just mentioned, being in the centre of the tissue of the leaf. Anatomical evidence, then, confirms the view that the tree called in gardens lasiocarpa is not the true species of that name, neither is it grandis, but that it is *A. concolor*.

Lastly, we note that Engelmann, quite cognisant as it appears with the distinguishing characters pointed out by Syme (though he does not specially mention the variety *violacea*), distinguishes the cultivated forms of concolor (*Lowiana*, *Parsonsiana*, *lasiocarpa*, *amabilis*) by their longer, flatter, straighter leaves, with fewer stomata on the upper side. As Dr. Engelmann was not aware that this species had fruited in cultivation, we were glad to furnish him with specimens of the cones kindly forwarded to us by Mr. Mackay, of Totteridge, from which also the accompanying illustration was taken. So that we have Dr. Engelmann's confirmation that the plant called *Lowiana* is really the same as his concolor. Dr. Engelmann suggested that possibly the leaves on the cone-bearing branches might be shorter and more falcate than those on the sterile branches, but this is not the case in Mr. Mackay's specimen. In any case it is one of the most beautiful of hardy trees. *M. T. M.*

COLONIAL BOTANIC GARDENS.

(Extracts from Mr. Dyer's lecture, continued from p. 646.)

CEYLON.—The botanical affairs of Ceylon would alone supply me with materials for addressing you at some length. Ceylon, in the crippled state of its Coffee industry, is suffering from the disastrous effect of a policy, the inexpediency of which cannot, I think, be too warmly insisted upon—that of a colony devoting almost all its energies to one object. It is impossible not to feel the deepest sympathy with the planters in their present distress and disappointment. Kew has done, or at any rate tried to do, everything that is possible to alleviate it. But whatever be the result, I do not doubt that one consequence will be to put botanical enterprise in Ceylon on a far sounder basis than heretofore. The cultivation of Tea, Cinchona,

FIG. 109.—ABIES CONCOLOR.

FIG. 110.—ABIES CONCOLOR (LOWIANA, LASIOCARPA, HORT.).

colour on both surfaces (whence the name), and bearing stomata on both sides (easily seen in the form of small circular spots with an ordinary magnifying-glass. The apex of the leaf has only a shallow and narrow notch. The leaves on the lateral shoots are

Liberian Coffee, and Cacao will, in a few years, no longer leave the planters, if they are wise in disposing their investments in the soil, at the mercy of the failure of a particular kind of crop. Ceylon is admirably equipped with a chain of three gardens, representing the three different zones of climate which the island possesses. It is to us a place of peculiar interest, and ought indeed to be regarded as the Kew of the East. We feel that when a new plant has been safely conveyed to Ceylon, its distribution over our other Eastern possessions is but a work of time. We have already of late years sent here the three most important Caoutchouc trees of South America, besides Liberian Coffee, and are now organising arrangements for securing for it the very best kinds of South American Cacaos. And when I specify these particularly, you will, of course, understand that they are simply the more conspicuous elements in a crowd of other plants which we have from time to time introduced.

## SINGAPORE.

Proceeding eastward, the Singapore garden must arrest us but a moment. It will be the depot for the supply and scientific investigation of the countries yet to be opened up in the Malayan Peninsula and Archipelago. In regard to the latter we have ourselves done but little, except to successfully introduce the Oil Palm from West Africa into Labuan. Our own resources here have, however, been enormously enlarged by the generous kindness of the Director of the magnificent Botanic Garden of the Dutch Government of Buitenzorg, in Java—a circumstance which it is impossible to allude to without regret, since in the untimely death of the amiable and accomplished Dr. Scheffer, every botanist who has entered into correspondence with him must feel that he has lost a personal friend.

Through Singapore we get an interchange of living plants with the French possessions of Saigon, whence we have obtained the Elephant Sugar-cane, which we still hope to succeed in introducing into the West Indies. Monsieur Pierre, the excellent botanist, who has for many years directed the botanical gardens of Cochinchina, has recently paid a prolonged visit to Kew, which he has generously presented with a fine series of specimens of its little known vegetation in graceful acknowledgment of the encouragement which in his early studies many years ago he received at the Calcutta Botanic Garden from Dr. Anderson.

## HONG KONG.

I must content myself with the briefest reference to Hong Kong, the botanical garden of which is described by those well competent to judge as possessing every excellence. The liberal-minded policy of the present Colonial Government has redeemed this unique establishment from the risk of sinking into a mere pleasure ground. It is from Hong Kong alone that we can look for the supply of intelligence as to the fascinating flora of China, and the innumerable singular uses to which for ages the products of its endemic vegetation have been put by the Chinese.

## AUSTRALIA.

With regard to our great Australian Colonies and New Zealand, I need not occupy your attention at any very great length. As I have already stated, their floras have been carefully worked out at Kew by the most competent hands, and in these splendid new homes of the English race there are already in the capitals of each colony botanical gardens animated with the entire spirit of Kew, and worthily comparing with it. Nor are there wanting scientific men (and I cannot but instance Fitzgerald, the author of an admirable work on Australian Orchids), who hold their own with those of the mother-country, and who are capable of dealing with any problems that present themselves, except, perhaps, those which even in Europe would be referred to particular specialists. The botanic garden of each colony will, I hope, ultimately possess a compendious reference herbarium of its flora, and an accessory economic museum. Sydney and Adelaide have already taken the lead in organising such departments of their botanic gardens on the Kew plan, and no doubt in due time the rest will follow the example. As long as Sir Ferdinand von Mueller is alive, Australia will possess one of the most learned botanists of modern times who is devoted to the study of her flora and a master of its details. As a scientific man, it is impossible not to envy the freedom which he

now possesses from all administrative labour. It is to be hoped that some joint arrangement may be arrived at amongst the several colonies to secure his unique herbarium of Australian plants as a permanent public establishment, to be provided with a moderate but proper endowment, and to be preserved for all time as a standard of reference in the Southern hemisphere for the accurate nomenclature of indigenous plants. It is to the credit of Victoria to possess him upon her civil establishment, but his scientific services have been rendered to the whole world, and I observe that his latest publication is a most useful report on the forest resources of Western Australia.

## NEW ZEALAND.

In New Zealand, botanical organisation is under the sure guidance of Dr. Hector, the Director of the Geological Survey, but a man whose scientific instinct may be unfailingly trusted in laying down the lines of its future institutions.

In Queensland, there is at present more room for botanical enterprise. A country fitted by every condition of soil and climate for any kind of tropical culture possesses in the Brisbane Acclimatisation Society, in addition to its Botanic Garden, a very active agency for the purpose. The indefatigable secretary corresponds with Kew by almost every mail, and we keep up a vigorous exchange with him as well as with the botanic garden. From an external point of view, there is much to be said in favour of a fusion of the two; there may be sound local reasons why they should remain apart, but there is no theoretical objection that I can see to their amalgamation, and the combined institution would surely be stronger than the separate, and in some respects competing, components. Botanic gardens, or botanical reserves, as they are sometimes called, have been marked out in the new northern towns, such as Rockhampton, Bowen, Townsville, and Cooktown. These have been lately visited by Mr. Bernays, who speaks with warm approval of the work done at the two former places, while at the two latter he thinks the name a misnomer, and that the places "are intended to be, and will probably become, people's parks." In any case, Brisbane is the headquarters of a field of botanical activity, which has already effected a good deal, and has now all the machinery for distributing new plants of importance throughout the colony.

## FIJI.

I must take a flying glance at Fiji, where, under the enthusiastic impulse of the Colonial Secretary, Mr. Thurston, a botanical garden has already started into existence. I will quote a few words from a private letter:—"At present I have about 500 Cacaos well established. By propagation I have now nearly 500 Vanillas; 150 Clove trees must also be counted, as well as a few Nutmegs, Gaurinias, Pomelos, and a great number of Palms. Two mails ago Dr. King, of the Howrah Gardens, sent me 208 packets and bags of seed—a tremendous lot. What to do I did not know, so, taking the bull by the horns, I sent a gang of prisoners up to the place, hired a white man with gardening proclivities, made beds, laid water on in pipes, and when germination began, invited the Governor to see it." Unfortunately Fiji has hampered itself with restrictive legislation, on account of the Coffee disease which has broken out in its plantations. It is the more to be regretted, as we had already taken steps to procure the best kinds of Cacao from the West Indies, and were endeavouring to arrange a systematic plan by which these and other plants of importance should be passed on from Kew to Ceylon, thence to Singapore, Brisbane, and Sydney, and so to the Pacific Islands.

(To be continued.)

## THE CATALPAS.

SEVERAL of our American friends have favoured us with lengthy communications relative to the species of Catalpa in cultivation in that country. If we understand the matter rightly, it would seem as if some confusion existed in American nurseries not only between the native American species and varieties, but also between them and those which have been introduced from China and Japan. No doubt the attention which has of late been excited by what has been written concerning *C. speciosa* by its discoverer, Dr. Warder, has stimulated curiosity as to the other species.

The species known in this country are *C. bignonioides*, *C. Bungei*, and *C. Kæmpferi*, to which we must add *C. speciosa* (Warder) and certain varieties of *C. bignonioides*.

*C. BIGNONIODES* (Walter, 1788) is the best known species, native of Georgia and the neighbouring States, and cultivated as an ornamental tree in the Atlantic States as far north as Massachusetts. This is the Catalpa generally grown in this country. Its bold foliage and loose panicles of whitish or very pale violet red-spotted flowers render it a great favourite. It is a rapid grower, but it is apt to suffer in hard winters, and the young shoots are very often killed by our spring frosts. It is only after unusually hot summers that the long, narrow, ribbon-like pods are produced. In our experience, although liable to injury from the causes just mentioned, the tree has great vitality, so that, though occasionally much crippled, its power of endurance under adverse circumstances is great. The finest specimen known to us is that in the garden of Denne Denne, Esq., near Canterbury, and which was illustrated in our columns in 1876, vol. v. p. 13. There is a specimen in the Kew herbarium taken from a tree at Norton Court, near Faversham, in 1798. It would be interesting to know if this tree is still in existence. Of this species there is a variety with leaves of golden-yellow colour. This is one of the very finest golden-leaved trees or shrubs that we possess, retaining its colour throughout the season, and if injured by frost breaking all the more readily afterwards, though we ought to add that we have no information at present as to how it may have braved the rigours of our past winter. Another variety, called by Carrière *C. erubescens* (*Rev. Horticulteur*, 1869, p. 460), is only known to us by name.

Nearly allied to *C. bignonioides* is *C. speciosa*, which replaces *C. bignonioides* in the Mississippi valley. This species was originally discovered by Dr. Warder in 1853, although it had been casually noticed so long ago as 1842 by Dr. Engelmann. Dr. Warder has himself favoured us with some particulars relating to the tree, from which we extract the following remarks:—

"In 1853 I found in the streets of Dayton, Ohio, some Catalpa trees of more erect habit, and that bloomed two or three weeks earlier than the common sort—*C. bignonioides*. The flowers were larger and more showy, being whiter, hence the name *speciosa* was applied to it, and nurserymen were urged to confine their propagation to this variety, as it was then supposed to be.

"Two brothers, John C. and Ed. Y. Teas, of Raysville, Indiana, propagated it largely, and distributed it widely, as an ornamental tree, and sent it out under this name.

"Within the past two years I have been investigating this tree, and in tracing out its natural habitats, and comparing it with *C. bignonioides*, have travelled more than 5000 miles.

"My excellent friend the botanist, Dr. Geo. Engelmann, of St. Louis, Missouri, has made it a species, adopting the name *speciosa*.

"This tree is the one described as a new Catalpa by me in 1853 on p. 533 of vol. iii. of the serial then under my care, and published in Cincinnati, Ohio, and called the *Western Horticultural Review*."

In the January number of the *American Botanical Gazette* Dr. Engelmann of St. Louis gives a technical description of the species, a portion of which—seeing that our American friends have generously furnished us with seeds which have been widely distributed in this country—it may be well to reproduce:—

"This tree has quite an interesting and instructive history. It was already known to Michaux and to many botanists and settlers of those regions; even the aboriginal Shawnees appreciated it, and the French settlers along the Wabash named it for them the Shawnee wood (Bois Chavanon), and prized the indestructible quality of its timber; but the botanists, even the subtle Rafinesque, who roamed over those very regions, seem to have taken it for granted that it was not distinct from the South-eastern Catalpa *bignonioides*. To me the fact that these trees, then really not cultivated in St. Louis, produced their larger and more showy flowers some ten or fifteen days earlier than the Eastern or common kind, was well known as early as 1842, and their blossoming has since been annually recorded in my notes on the advance of vegetation, but I had not the sagacity or curiosity to farther investigate the tree. It was reserved to Dr. J. A. Warder, of Cincinnati, to draw public attention to it.

"Catalpa *speciosa* replaces *C. bignonioides* entirely in the Mississippi valley. It is readily distinguished from it by its taller and straighter growth, its darker, thicker ( $\frac{1}{2}$ —1 inch thick), rougher and scarcely exfoliating bark

(in the older species it is light grey, constantly peeling off and therefore not more than 2 or 3 lines thick); its softly downy, slenderly acuminate and inodorous leaves (those of bignonioides have a disagreeable, almost fetid odour when touched), marked with similar glands in the axils of the principal veins of the under side; by its much less crowded panicle and by its much larger flower, fruit, and seed. The flowers I found 2 inches in the vertical and a little more in the transverse diameter; in the other they have  $1\frac{1}{2}$  inch in each diameter; the lower lobe is deeply notched or bilobed in speciosa, entire in bignonioides; the tube in the former is conical and 10 lines, in the latter campanulate and about 7 lines long, in the first slightly oblique, in the other very much so, the upper part being a great deal shorter than the lower one, so that the anthers and stigma\* become uncovered; the markings in the flower of the old species are much more crowded and conspicuous, so as to give the whole flower a dingy appearance, while ours looks almost white. The upper lip of the corolla before expansion extends beyond the other lobes and covers them like a hood in the Western species, while in the Eastern it is much shorter than the others and covers them only very partially. The pods of our species are 8 to 20 inches long, 17 to 20 lines in circumference, dark brown and strongly grooved, when dry, the placental dissepiment very thick; in the eastern species the pod is nearly the same length, but only 9 to 12 lines in circumference, its grooves very slight, its colour pale and the dissepiment flat. In both species the pod is perfectly terete before the valves separate, after that the valves of ours remain more or less semiterete, while the much thinner ones of the other flatten out, so that they seem to indicate a compressed pod. The elongated seeds, winged at both ends, are of about equal length in both species, but in speciosa they are much wider ( $3\frac{1}{2}$  to 4 times) and the wings have more or less rounded ends which terminate in a broad band of rather short hair; in bignonioides the seeds are only  $2\frac{1}{2}$  to 3 lines wide, with pointed wings, and their tips terminating in a long, pencil-shaped tuft of hair.

"Our tree is larger, of straighter growth, and being a native of a more northern latitude is harder than the south-eastern species; the wood of both is extremely durable, perhaps as much so as that of our Red Cedar, and has the advantage over it of a more rapid growth and of possessing only a very thin layer (two or three annual rings) of destructible sap-wood. But of these qualities and of its adaptability to many important uses others, and especially Mr. Burney in a recent pamphlet, have given a full account. It is already extensively planted in our Western prairie States, and especially along railroads, for which it is expected to furnish the much-needed timber in a comparatively short time. *G. Engelmann, St. Louis, Jan. 1, 1880.*"

CATALPA LONGISILIQUA, figured by Sims in the *Botanical Magazine*, t. 1094, under the name of *C. longissima*, is a West Indian species, with ovate oblong leaves and wingless seeds. It is a stove plant, which is perhaps not now in cultivation, and for our present purpose may be dismissed with the mere mention.

C. KÆMPFERI, a native of Japan, was recognised by Kæmpfer under the name of *Bignonia Catalpa* (1784). It is a small tree, with leaves of various shapes, often lobed, slightly hairy, and with branching panicles of relatively small flowers. Corolla clear yellow spotted with reddish-brown, lobes toothed. The pods are apparently much narrower than in the American species. This is considered by De Candolle as a mere variety of the American species, but the points of distinction so obvious in the flowering stage that for practical purposes it is better to treat it as a distinct species, as, indeed, most authors do. Still it is an interesting example of that close resemblance between the flora of Japan and of East America, which has been so profitably noted by Dr. Asa Gray. A dwarf variety is grown in our nurseries, and in some Continental catalogues we have met with the name *C. Kæmpferi nana cœrulea*, of which, however, we know nothing but the name.

C. BUNGEI is a native of Northern China. It is a tree, and has ovate, acuminate, entire, or lobed glabrous leaves, and large flowers described as greenish-yellow with red spots in simple clusters or racemes. In our gardens it is shrubby. Sometimes entire and lobed leaves are found on one and the same tree, as in the variety *heterophylla*. Of this species also some catalogues make a variety "nana,"

\* I may here remark that *Catalpa*, probably like all its allies is proterandrous; the anthers open in the morning and the lobes of the stigma separate and become glutinous towards evening, the upper lobe remaining erect, the lower turning down close upon the style. I have not ascertained how they are impregnated, as at that time the anthers are effete, and by the following morning the lobes of the stigma are again closed.

but in all probability the dwarf habit is a mere affair of climate or altitude.

In catalogues we have also met with the name *C. Wallichii*, but of this we know nothing but the name.

Disregarding *C. longisiliqua* we may offer the following table as a guide to the discrimination of the species. Were the pods and seeds known in all cases it is probable they would afford better means of distinguishing the forms. The seeds of bignonioides and speciosa, for instance, are very distinct, but they are not likely to be often seen in English gardens. It must also be borne in mind that the characters taken from the habit and the form and degree of hairiness of the leaves are likely to be variable.

Leaves glabrous.	} BUNGEI.
Leaves mostly entire; flowers large, in racemes.	
Leaves downy or hairy.	} BIGNONIoidES.
Leaves mostly entire; flowers large, in panicles.	
Upper lip of corolla shorter than the lower, which is entire.	
Upper lip of corolla longer than the lower, which is bilobed.	
Leaves mostly lobed; flowers small, in panicles.	} KÆMPFERI.

### CATALPA KÆMPFERI?

MR. HOVEY sends us copies of letters he has received relating to the Japan *Catalpa*. We extract therefrom certain passages of interest as regards the description of the trees, but as we are not in possession of specimens of the plants in dispute, we can only refer to the foregoing article:—

"*Carthage, Mo.*—In the spring of 1866 I bought of Malhon Moon, nurseryman, Morrisville, Bucks County, Pennsylvania, a Japan *Catalpa*. He received the seed and sold the young trees without specific name. My trees soon bloomed and bore seeds. I left the trees at my old house in Indiana, and raised more from the seed of them, here, in 1871. These have made a very rapid upright growth, and are now 25 feet high, with trunks 2 feet in circumference—large open heads—blooming more profusely, and in much larger panicles, than the common American *C. bignonioides*. The flowers are not quite so large, and a little more coloured, same colours and marblings, but more colour and less white, and quite fragrant, much more so than the common *Catalpa*. The leaves of the Japan [form] are various generally much like other *Catalpa* leaves, but quite often lobed, some on one side and some on both, and the lobes generally ending in a sharp acute point, which is a characteristic of this kind, and wholly unlike any other *Catalpa* I have ever seen. But the most marked peculiarity is the seed-pods, which in the Japan species are very slender, not larger than a goose-quill, though of about the ordinary length. The seeds are also very small, a pound containing 50,000, while a pound of the common contains but little over 20,000.

"Some botanists have supposed, from the seeds and other things, it might be *C. Kæmpferi*. But it is wholly unlike what we grow as *C. Kæmpferi*, received from Rochester perhaps fifteen years ago. We had also what appears to be exactly the same, about the same time, from France, as *Catalpa nana*. Our plants of these last two kinds (which we think one with two names) are now ten years old, the best one  $9\frac{1}{2}$  feet high, with innumerable stems from the ground, like a great old Currant bush, and 40 feet in circumference of branches at 4 to 5 feet from the ground. They have not yet shown any bloom, though we have expected it, and have watched them closely for several years. It is a nice bush, but not a tree at all. The leaves are small, slender. The growth is very dense, outline almost as smooth and even as a clipped hedge, though never cut.

"The Japan form grows with, I think, double the rapidity of the common *Catalpa*, and will probably make a most valuable timber tree.

"Among some seeds collected in Japan by Mr. Hogg, and advertised by Messrs. Thorburn, of New York, were some, advertised as follows:—CATALPA, sp.: Is probably *C. Bungei* or *C. Kæmpferi*. In either case it is perfectly hardy: both are fine species.

"And now," continues Mr. Hovey, "as to the true name, which was supposed to be *C. Bungei* or *C. Kæmpferi*. It is not the latter, if I have had the true species, as it is only a dwarf shrub. The original description of *C. Bungei* or *C. Kæmpferi* would ascertain this, for it now appears that both of the kinds named received in this country have proved to be the same, as well as another called *C. nana*. Perhaps Mr. Hogg could enlighten us in regard to this tree, for he or his employé know enough about it to say in the advertisement 'either *C. Bungei* or *Kæmpferi*; both are fine species;' and they could not have well done this had they not seen them growing. This detailed statement

may induce Mr. Hogg, should he see it, to tell us something more about a tree which appears from various accounts to be a valuable introduction, and I have thought that this full history was important to record in reference to a tree that seems destined to hold a prominent place in the arboriculture of this country. *C. M. Hovey, Boston, U.S.*"

### IN THE RUSSIAN STEPPES.

SEKIRENSY.—When we speak of the Steppes it is perhaps unnecessary to state that we speak of the almost boundless plains—vast, open, level, naked corn lands—of Russia. In such extensive and sometimes dreary solitudes, it is nothing remarkable to drive along during several hours without coming to so much as a small village. Frequently enough it happens that, in one direction or another, there is neither a bush nor tree to be seen as far as the eye can reach. To find anything like what we should call a garden, it may be necessary to make a journey of 100 or 200 versts. Either from the want of taste or from the want of intelligence or means, the nobles generally do not like to spend money on their gardens. It is difficult to convince them that a garden after a certain time may be made not only to cover its expenses, but to yield a certain revenue. As I have already had occasion to observe, one of the chief causes of this disorder and neglect is the fact that the garden is usually under the control and direction of what is called the *Opatlayoushtshi-intendant*, or something in the way of a land steward, but not quite that. In this country these are sometimes fine gentlemen who waste a good deal of powder and shot very harmlessly, and in other respects their particular talent is proverbial. From one cause or another, it is rare enough to find a good garden in the Steppes: so it happens that there are favoured spots here and there where all that Nature can bestow—climate, soil, situation, and water—have been profusely lavished in vain. Instead of order, beauty and abundance, we sometimes find only a barren wilderness, where anything like intelligence, and a practical scientific plan, either respecting the arrangements of the ground or its profitable cultivation, have never been taken into account.

In such a country it is a treat of no ordinary kind to find out a long established and well kept garden such as may be compared to what is generally seen in England. I was fortunate enough in the autumn to be able to pay a visit to one or two such gardens, and my notes contain some things which, from their unusual character, I think may be worthy of notice in your columns.

About 150 versts from Kieff in the direction of Koorsk, the railway branches off to the scattered town of Romny, remarkable chiefly for its numerous avenues of stately old trees, and its immensely long and wide streets or roads. As the houses are all more or less detached, like our suburban villas, it is easy to understand that there are everywhere a great many small cottage gardens. Especially in the low-lying parts of the outskirts, there are some very pleasant places. In general, the landscape in this part of the country is sufficiently varied in hill and dale, wood and water, but the trees are, of course, only of the commonest sorts, as Limes, Elms, Oaks and Willows in particular.

About 40 versts westward from the railway we come to Sekirensy, the estate of His Excellency the General Galagan, one of the oldest and most honoured names in this part of Russia, a gentleman with immense wealth and highly-cultivated tastes. M. Galagan has spared neither expense nor pains to have his mansion and grounds in keeping with princely grandeur and beauty. After a dreary drive of several hours it was a pleasure of the most exquisite kind to come at last to this place, and stroll freely about the garden and park, which strongly reminded me of Chiswick and other places at home.

M. Galagan informed me that the grounds were originally laid out some fifty years ago by a German landscape-gardener called Bisterfeld, and though I consider that there are some things which are not beyond the reach of criticism, it is only fair to allow that the plan in general has been well studied, carefully carried out, and perseveringly followed up to the present time. The broad and gracefully winding walks, the spacious well-kept lawn and majestic trees charm the eye at every turn. Here Nature herself has furnished the essential conditions of a splendid garden, and with-

out that condition in a climate like this Art would never do so much. There are plenty of trees, indeed Sekirensy seems to have been formed in a wood or forest. Though occupying a somewhat elevated position, the mansion and grounds are surrounded on all sides with dense masses of old and noble trees. Another condition of not less importance in all successful gardening must also be taken into account. Unlike other grand people in this part of the country, who seem to expect their gardeners to work miracles in a few months, General Galagan has adopted the wise plan of making few changes. Almost everybody employed here has had a long lease of service. The head gardener, Herr Hæger, has been in his situation not less than thirty-six years; the foreman, Herr Yanetschek, over twelve years. Most of the workmen, too, have been here from ten to fifteen years, so that it may be safely said every man is well accustomed to his duties. In that way it is easy enough to have something resembling a garden, whether on a large or small scale, especially where the gardener, as here, is master in his place, and has nothing to do with the steward.

Before I proceed with details respecting the garden I must make a short digression. In Russia we find a church connected with every public institution, and in the Steppes what we should call the village church is very near the seignor's house, sometimes within the grounds. But here in Sekirensy there are two splendid churches in the very middle of the garden, about 100 paces from the mansion. Before the emancipation of the serfs the nobles were much richer than now, and it was only in keeping with their wealth and rank to have a church for themselves as well as the great number of people always in their service. For that reason one of the churches here was built long ago. The other, a few paces further off, is very modern, having been erected only some ten years since to commemorate the death of a much lamented only son, who lies buried in a vault at one side, so that it is a mausoleum as well as a church. But service, I believe, is only performed there on particular occasions, such as anniversaries, "name-days," and the like. The bereaved parents have also perpetuated the memory of their son, by founding an educational college bearing his name in the town of Kieff.

The very day after my arrival happened to be the anniversary, and I was enabled to be present at one of the grandest church services which I have seen for some time, and view the magnificence with which the interior has been arranged. In the Russian church what we should call the altar or *sanctum sanctorum* is always enclosed, leaving three folding-doors of communication for the priests. This enclosure on the outside is always elaborately covered with pictures derived from sacred history. This is called the *ikonostass*, and it is usually a work of great beauty; but I have rarely seen anything to equal the taste and dazzling splendour that have been lavished on the *ikonostass* in this church. From the ceiling to the floor the whole width of the space is a display of the most gorgeous and brilliant kind which it is possible to conceive; not only are the pictures beautifully painted, but the ornamental carving and gilding have been done with a masterly hand. The music, too, under the direction of an intelligent leader, was exceedingly solemn and affecting. Happy are they who live in a paradise on earth, and have all the means of preparing for another in Heaven! *P. F. Keir.*

(To be continued.)

## GARDEN GOSSIP.

BY A LADY.—No. VI.

OLD-FASHIONED GARDENS. — England still possesses a few out-of-the-way nooks and corners where time appears to stand still, and where old fashions still linger, in spite of the spread of railways and education. In such places we may still occasionally meet with an old-fashioned garden, by which I mean a garden in which flowers, fruits, and vegetables are all intermingled, instead of being confined to different parts of the ground.

Fifty years ago such gardens were still common, especially at country parsonages and among the dwellers in small towns. There was a charm of their own about them, with their gravel walks bordered by flowers or Strawberry beds, behind which espaliers formed a screen to the vegetables beyond.

The old people who had grown up among such gardens did not relish the new-fangled notion of putting everything out of sight except flowers. "There's

duced without the necessary herbs and vegetables, and their re-awakened interest in cooking may re-awaken their interest in the kitchen garden.

The modern fashion of putting nothing but flowers and fruit on a dinner-table must bear some part of the blame; it necessitates a greenhouse, if "dinner parties" are to be given, and there is nothing on which a gardener can fritter away so much time—often to the neglect of less pleasant work. Thus it sometimes happens that in small establishments, where only a man-of-all-work is kept, Pelargoniums may be met with in abundance, while the cook is at her wits' end to find materials for the proper furnishing forth of the dinner which is replaced by them on the table.

Some other old-fashioned habits in the arrangements of the dinner-table must have had their share in stimulating gardeners to do their best with other things than fruit and flowers. I remember a gardener of ours, who took pride in his Cucumbers, told one of the "young gentlemen" of the house, that he liked to fancy the master taking up the Cucumber and admiring its size and shape before proceeding to cut it. Poor man! he did not realise that the cook alone would see it in its beauty, and that it would only reach the table in slices, drowned in vinegar and pepper, when its flavour would be as dependent on the skill of the cook as on that of the gardener.

FIG. 112.—VAN THOL TULIP, STARVED.

naught for the mouth," was the favourite remark of one old lady when walking round the "flower gardens," which were to her a modern and objectionable introduction.

In her days a good housewife was one who looked after her kitchen, and personally superintended the cooking, if she did not actually take part in it, and it necessarily followed that interest in the kitchen would lead to interest in the kitchen garden, and to personal superintendence of the fruits and vegetables; therefore, why poke them away out of sight? I can quite believe that when this was the state of affairs the herbs and vegetables received as much attention from the mistress of the house as did the flowers, and that she would have been horrified if mackerel had appeared on table without fennel sauce through any neglect of the gardener; or if, while the greenhouse was filled with flowers, her cook had to beg Parsley and Horse-radish from more careful neighbours. Yet I have known these misfortunes to happen in this year of advance and progress—1880.

Perhaps now that it is the fashion for ladies to attend cooking schools they will begin to realise that delicately flavoured soups and gravies cannot be pro-

Whether horticultural shows supply the place of the old-fashioned dinner-table in displaying the gardener's skill in growing vegetables, is doubtful. Probably they do in many instances, but not often in the particular cases to which I allude, and they are no test whatever of the gardener's care in providing everything necessary to the cook. He may carry off prizes for Broccoli and Cucumbers, while his salads are a failure and his herb-ground neglected; the neglect does not appear at the show, and what does it matter to him if the cook is obliged to buy dried Mint and Thyme at the grocer's to supply the place of what he ought to have furnished?

The remedy lies in the hands of the mistress. If she takes as much interest in the kitchen and kitchen garden as her great-grandmothers did, the cook and gardener will take increased interest in them too; but if the lady thinks only of her flowers the gardener will do the same, and the unfortunate cook will bear the blame, because her dinner cannot compare in excellence with the table decorations. *A. B.*

BIGNONIA CAPREOLATA. — A remarkably handsome variety of the old and well-known *Bignonia capreolata* is now flowering in the No. 4 house at Kew. It differs from the type in its dark, blood-red flowers. A figure of it will, we believe, shortly appear in the *Botanical Magazine*.

HOW SHOULD WINTER FRUIT BE STORED TO PRESERVE IT FOR THE LONGEST POSSIBLE PERIOD?—This is a question that concerns growers and consumers alike, and any information on the subject, whether of a positive or negative character, cannot be too widely published. Dr. Paul Sorauer, Director of the Proskau Experimental Station of Vegetable Physiology, has lately published the results of a series of experiments carried out by him to ascertain the best means of preserving fruit in a marketable condition. It is hardly necessary to say that the longer we can keep Apples and Pears, &c., the more valuable they become. We have not space to follow him through his experiments, but as each experiment was limited to a small number of Apples the results are not altogether convincing. The one condition indispensable to long-keeping in all cases was an intact skin,

## WHAT CULTIVATION CAN DO.

THE accompanying illustrations (figs. 111, 112, 113), which are taken from specimens kindly furnished by Mr. Elwes, and which were shown before a recent meeting of the Scientific Committee of the Royal Horticultural Society, show in a very striking manner the pliability or intrinsic property of variation possessed by plants. The first figure is that of *Tulipa Kolpakowskyana* as imported, with its small flowers, whose segments are prolonged into sharp points, acuminate, and its simply lobed stigma. Compare this with flowers of the same species after three years' cultivation, and note the greatly increased size of the flower, the rounded apex of the segments of the perianth, and the markedly lobed and crumpled stigma. The pollen grains are, as Mr. Worthington Smith tells us, in point of size the same, but in the

race of gardeners are wholly unacquainted with them, and yet they are extremely ornamental greenhouse twiners, largely possessing the charms of beauty and distinctness. It is curious to note how wide apart geographically were the sources from which the plants were derived. *T. alata* came to us from the East Indies; its variety *alba* from Madagascar. Two other varieties, viz., *Bakeri* and *flava*, came from America, and the rich yellow-flowered *aurantiaca* from Madagascar. For years these plants were very popular; but by slow degrees they have fallen away from cultivation. Perhaps the fact that they are very subject to attacks of red-spider when grown in an ordinary greenhouse tells against their cultivation in pots, but in the flower garden, for rustic baskets, vases, &c., they are very valuable. The seeds can be sown at once, but April is the best month in which to raise them; and it is

very much lower temperature through the latter part of the summer and autumn than it is generally considered to require. Doubtless its flowers under these conditions will be finer coloured than when grown in a hotter, more confined, moist atmosphere.

— *TRIPHASIA TRIFOLIATA*.—This very peculiar shrub, the hardiest of all the members of the Orange family, is now flowering in the open air at Kew. The cream-coloured blossoms, nearly or quite scentless, are not at all showy, but still fairly conspicuous on the rigid, dark green, spinous branches. The leaves, which are produced much later on, are composed of three oval leaflets. The beautiful red-skinned, Gooseberry-like fruits, preserved in syrup, are sometimes imported to this country. A native of Southern China, but now naturalised (and cultivated throughout the East Indies, and grown in the West Indies and elsewhere.

— *AMARYLLIS BELLADONNA*.—Some two or three years ago Mr. Roberts planted at Gunnersbury Park a bed of Belladonna Lilies along the south front of a plant-house in two divisions, the eastern division of which is used for the growth of stove plants, where a high, moist temperature is maintained; the western division being for the growth mainly of New Holland plants, where the temperature is much cooler. It is interesting to notice how the difference in temperature of the two houses has affected the Belladonna Lilies in the outside border; in the first case the growth is free, luxuriant, and robust, and the border is well furnished with foliage; in the other case, owing to the colder temperature within, the foliage is poor, uneven, and weakly. It is similarly affected the production of flowers in the autumn; and the moral to be deduced is, that it is an advantage to plant against a house when the temperature is high; but whether there is induced a certain undue excitement, that may prove inimical to the durability of the bulbs, remains to be seen.

— *EUCALYPTUS POLYANTHEMOS*.—The fine specimen of this tree, near Museum No. 1, at Kew, looks far worse now than it did two months ago. The frosts and the cold winds of the last fortnight seem to have had a considerable effect on the foliage, which the past winter with all its rigour had apparently spared. Most of the leaves are now fallen, all those remaining are very brown and dry-looking, and the tree altogether presents a woeful aspect. It is to be hoped that this specimen, which is looked upon with especial interest by large numbers of foreign and colonial visitors to the Royal gardens, may again recover; at present, however, such a prospect seems somewhat doubtful. Several Pines, too, have within the last ten days or a fortnight apparently given up the struggle for existence. Large plants of *P. muricata* which, after winter had passed away, seemed, in spite of brown patches here and there, likely to grow out of the damage which had been inflicted on them, are now hopelessly ruined. *P. insignis* is one which has suffered very severely, but its injuries were evident from the first.

— *ERYSIMUM PULCHELLUM*.—This very dwarf perennial is a pleasing addition to our stock of hardy spring flowering plants. Unlike the annual *Erysimums* that grow so tall and ungainly, this new kind does not exceed 4 inches in height, and forms a dense compact carpet of foliage and sulphur-yellow bloom. It really resembles a very dwarf form of *Cheiranthus alpinus*, but the two plants are closely allied. In the Reading seed-grounds seed of this was sown in the spring as an annual, but not blooming during the summer was permitted to stand over till now, and is very effective and found perfectly hardy. We also met with it lately in the nursery of Messrs. CRIPPS at Tunbridge Wells.

— *DELPHINIUM TRICORNE*.—This pretty and distinct species of Larkspur is now in flower in the gardens at Loxford Hall. It is a tuberous-rooted perennial, the leaves of which are more deeply cut than in the ordinary garden forms, such as *D. formosum*. The whole plant is not more than a foot high. The flowers are dark blue, borne on dense spikes about 6 inches long. It is the earliest Larkspur to flower, and is well adapted as a rockwork plant or for the herbaceous border. It was introduced by Messrs. Backhouse, of York.

— *AERIDES VEITCHII*.—This very fine representative of the genus is now in rare condition in the East India-house at Gunnersbury Park, the plant having put forth a very fine spike with four spikelets

FIG. 113.—TULIPA KOLPAKOWSKYANA, AFTER THREE YEARS' CULTIVATION.

wild plant they are yellow, in the larger form greenish-yellow. The illustrations are valuable, not only as showing what can be effected after a very short period of cultivation, but also as affording evidence of the wide variations possible in plants of the same species, and *pro tanto* of the unsatisfactory character of the points relied on to distinguish species. Fig. 112, p. 652, represents a flower of the scarlet Van Thol purposely starved to reduce it to its wild condition.

## PLANT GOSSIP.

**THUNBERGIAS.**—What a sensation would be caused if some one were to cultivate the representatives of this genus as they deserve to be grown, and exhibit them in flower at one of the meetings of the Royal Horticultural Society. Seedsmen tell us—and it is a statement to be received with something akin to sorrow—that year by year the demand for seed of these beautiful annual climbers lessens. Thus there is a danger these plants will become, to a large extent, lost to cultivation. In all probability many of the younger

recommended that the seeds be moistened before sowing, and then raised in a strong hotbed, and when large enough that they be potted into sandy loam and peat, and at later shifts be treated to a good portion of poor lime rubbish.

— **BOUGAINVILLEA GLABRA IN COOL QUARTERS.**—This Bougainvillea, which has so much to recommend it—in being easily grown and free to bloom, the flowers effective on the plant, and amongst the best and most enduring when cut—will evidently succeed in a lower temperature when at rest than most people usually try it in. Mr. Jaques, the gardener at Davenham Bank, Malvern, has it in company with *Maréchal Niel* Rose, planted out and trained on the back wall of a high lean-to Peach-house that is forced so as to have the crop ripe about the end of May. The plants in question cover the upper portion of the wall, where their heads are not much shaded by the Peaches, and are in a healthy vigorous condition. The Bougainvillea will necessarily be later in blooming than where subjected to more heat early in the season, and in such company it must evidently be submitted to a

issuing from it. There is something most captivating in the pale soft and yet lustrous lilac of the colour, and as the spike is massive and the individual flowers fine, this aspect is intensified. All the *Acerides* and *Saccoblabium* look remarkably well, and there is a rare promise of bloom from the whole of them.

— **DENDROBIUM CHRYSANTHUM.**—In Mr. Wyatt's collection of Orchids at Cheltenham there is a large example of this fine old *Dendro* that gives one of the many evidences continually occurring of the great mistake that is made in growing Orchids from comparatively cool countries in a high temperature. The plant in question is a large one, and it has been grown as usual in a basket hung up, and had been kept for years in a house amongst such species as require a good deal of heat. It made stout strong bulbs, 3 feet in length, which used to produce here and there a few flowers, but nothing proportionate to the number the plant might be expected to afford, and on this account early last summer it was condemned to be thrown away. Meantime Mr. Simcoe, the gardener, hung it up near the light in a potting shed, a portion of the roof of which is glass; here it received only very slight warmth, but as it kept on growing it had now and then a little water given, and completed stout bulbs, about 2 feet in length. It remained in this position all through the autumn and cold winter, when the thermometer was several times down to 35°, showing flower. Later on it was moved into a house a little warmer, and when we saw it recently it had eleven bulbs blooming profusely, several of the largest having over forty flowers a-piece; five or six of the nodes on each of them produced as much as five flowers at a joint. It is evident that this plant will do very much better with less heat and moisture, as well as more air than is generally given to it.

## Forestry.

THE diseases which affect forest trees may be divided into three classes, viz., such as affect the roots, those confined to the stems and branches, and those connected with the leaves. These diseases assume many different forms, and each of the three classes may be divided and subdivided almost without end. It is not within the province of this article to define the term disease, and it is, therefore, only to be understood in the general sense, and regarded as the abnormal state of health of the subjects to which it refers.

If in any case the producing cause of the disease is thoroughly known, the most important step in advance towards effecting a cure may be said to have been attained, and it is doubtless one of the chief reasons why so comparatively little progress has been made in the attainment of sound knowledge, that secondary causes have been regarded as primary ones, or that what is thought to be the cause is only the effect. What makes the detection no less than the treatment of disease more difficult than it would otherwise be, is the circumstance of their being not simple or single, but a combination; and most diseases, if not a combination at first, in a short time usually become so.

The leaves, for example, when from any cause prematurely arrested in their growth, do not, probably for a single day, remain without contracting some new disease, or at least developing some new phase of it. The young and tender foliage, for example, singed by a few hours' frost, blasted by a cold east wind or northern blast, or by the sea-breeze if within its influence. Mildew, honeydew, or blight, from whatever cause, are succeeded by a host of insects almost invariably following in their train: for who does not know that diseased leaves are always infested with insects in one or other of their numerous forms? Or again, excessive drought or heat, superabundance of moisture, whether in the ground or in the atmosphere, dull, cloudy, sunless weather, dampness, or cold—sudden transitions from one state to another, as from cold to heat, or heat to cold, submerging the roots in water, or suddenly depriving them of it—any one of which, or either singly, will produce that state termed disease.

It is well that some forms of leaf disease are preventable, since few are susceptible of cure. That little can be done to cure leaf diseases in forest trees is obvious—first, because the disease is too far advanced before it is observable; and, second, when it is discovered and known to exist it

cannot be reached, for who would attempt to dust, fumigate, or syringe the foliage of an Oak or Elm from 50 to 100 feet high, and with an expanse of branches as many feet wide? It is a very simple and comparatively easy task to collect the various species of caterpillar that attack the plantlets in the nursery and destroy them, but who would undertake to go over a forest of hundreds or thousands of acres in search of the Pine beetle or other insect, larger or smaller? The bark of trees bears close analogy to the skin of animals, and what the skin does for the latter the bark does for the former. Now we well know, and yet the knowledge is not so general as could be desired, that the clean and healthy skin contributes as much to the health and comfort of an animal as food and water do. By the skin the health of an animal is pretty correctly judged of, and by the bark of a tree the experienced eye detects much. Now while it is very obvious that diseased bark cannot exist upon a tree whose sap and secretions are pure and healthy, yet it is quite within the scope of possibility that a diseased bark may contaminate the whole structure of the tree; and when this is the case, it is not an unreasonable thing to inquire can the diseased bark be cured? I think several forms of bark disease can be cured, but as the experiments I have made are only of comparatively recent date, and have not been sufficiently established, I shall avoid saying too much in their favour lest I should mislead. What I have done has been to apply R. Davidson's composition for preventing ground game injuring trees by barking them, and in doing so I have noticed some very remarkable and interesting results. The composition so far softens the outer bark of the tree as to relax the whole structure and impart to it a freshness and succulence such as is usually found in young vigorous growths. The greatest improvement observable is in the case of stunted, bark-bound trees of slow and rigid growth. The outer bark of such trees is usually as light and compressed as ligatures of leather, and this probably prevents the sap flowing, or the woody matter forming so perfectly as it should, and would do, but for the compressed nature of the bark. It also completely clears the tree of every form of lichen and moss. This latter effect I am well aware some will demur to, as they like and admire these lower forms of growth as much if not more than they do the higher or tree products. I do not dispute their title to admire the beautiful lichens and hoary or shaggy mosses which adorn the old and mature denizens of a century's growth; but while these are natural, beautiful and commendable in an old and mature tree, they are not so in young or middle-aged ones, and such as are prematurely old on account of adversity from which they cry for deliverance. C. F. Michie, *Cullen House, Cullen, Banffshire, May 17.*

## Garden Operations.

### KITCHEN GARDEN.

**CABBAGE.**—This esculent is so universally grown that it would hardly be possible to find out a garden in which it is not cultivated, or a household where, as a common culinary vegetable, it is not in frequent or almost daily use. These and other considerations in connection with it, as the duration of its season and the appreciable qualities it possesses, emphatically prove that it is one of the most useful products of the garden. As a crop it is a very exhaustive one, and also a profitable one. In common with all other plants of a succulent nature, it is a gross feeder, and therefore it needs the very richest of soils to produce it in the highest state of excellence. In order to have a supply of it in some form or another, either heads or sprouts, at all seasons of the year, it is necessary to make several sowings of it at various periods. By a course of practice and careful observation I have come to the conclusion that, for private purposes, these should be made in the following order: For the earliest crop in the spring at about July 24, for the subsequent or general crop about August 8; in both cases the requisite number of plants obtained from these sowings are to be planted out as soon as they are ready for the operation, and a number of the smallest plants from the latter sowing should be pricked out into beds, where they may remain until the following March or April, and are then to be planted out finally. These come in as an intermediary crop between the former and that acquired by the next or spring sowing, which should be made in a snug place or in a cold frame towards the end of February. The fourth and

last sowing of the season should be made the first week in June: at this time an ample supply of seed of that useful hardy and compact little Cabbage, the Rosette Colewort, should be included. A most important fact in connection with Cabbage cultivation which is either overlooked or totally disregarded in many instances, is the preparation of the plants prior to planting them out. These should be formed in the sturdiest manner possible, a condition acquirable only by means of pricking out the plants at an early stage of growth, or by making larger seed-beds and sowing it very thinly. In my opinion the former process is the most commendable, and of such importance at the stage of growth described that it merits further recommendation; indeed, it should be adopted generally in connection with every class of similar vegetables. Cabbage plants should always be planted out as soon as fit for the operation, and have the soil pressed firmly about the roots; they should be placed slightly below the level of the surface, for which end drills from 2 to 3 inches deep are necessary, the distance apart of course varying according to the requirements; large varieties should have from 18 inches to 2 feet every way, and for those of lesser growth and for Rosette or other Coleworts a foot will be enough. Hoeing and stirring the soil about the plants are not only required to free the surface from weeds, but their effect during the early stage of growth is such as to accelerate it marvellously. It has become a settled rule here to keep a certain quantity of the stems after the Cabbages are cut from the general crop—those plants which were sown August 8 preceding hot dry seasons; these stems invariably produce cleaner heads at a certain period than those obtained from individual plants which come into use at about the same time. Like most other culinary vegetables this has a number of varieties, known under various names, many of which are found to be identical in most respects: we select for our private requirements the following kinds, namely:—Bailey's Selected, a most useful early variety; Heartwell Marrow, the best of all for general purposes; and the Rosette Colewort, a pre-eminently excellent little Cabbage for winter use, provided the seed be sown at the proper time, namely, the first week in June. Another sort, which is absolutely indispensable to some extent everywhere, is the red variety for pickling; this sort can be obtained either by sowing the seed about August 8 or otherwise, with the advanced sowing of the other kind about the end of February.

**ORDINARY WORK.**—A dry period such as we are experiencing, although very beneficial in some respects will on the other hand entail considerable labour in watering, an operation which at this period should be performed before mid-day, and will be indispensably necessary in the case of plants in seed-beds, to those pricked out under similar circumstances, and to early crops of many other subjects, as Turnips, Carrots, Lettuce, Radishes, &c. The absence of showers this spring is rather inimical to the free growth of Asparagus, which as yet does not come up kindly and shows unmistakably the want of the water. The cutting of this subject should be seen to almost daily, in order to have it in a proper condition. My plan is to cut all the "grass" that comes up until a certain period, and then let the growth proceed altogether. In the first instance, we cease cutting from plants which will be wanted for forcing purposes; this takes place as soon as the early crop of Peas comes in for use; but cutting is continued from the others until such time as the demands grow less, when another portion is allowed a free course of growth; and the rest of the beds as soon as practicable afterwards. If not already done, remove winter crops of Spinach from the ground without further delay; this is essential for the wellbeing of the land. In some places it may be turned in in the process of digging the ground, but this is hardly to be recommended in others; as, for instance, where the roots of wall trees abound it would not be advisable to do so. Our early plots of Brussels Sprouts and Cottagers' Kale are already put out between the rows of the main crop of the early Ashleaf section of kidney Potatoes, and now stand at a distance of 3 feet by 2 feet apart. The earliest batch of plants of Dickson's Eclipse Cauliflower is likewise planted on an open quarter. Other plantings will forthwith be proceeded with in the way of spring sown plants of Parsley for a general crop, of Leeks and Celery for an advanced crop, and of Savoys and other kinds of winter stuff as soon as the plants are fit and ground becomes available for the purpose. Wherever mulching material has been this spring it will indeed be beneficial, particularly to crops of Peas, Cauliflowers, &c. As is systematic practice this really cannot be too urgently enjoined. The condition of early crops of Peas in general at the present time (May 17) is highly promising; those placed out-of-doors are blooming satisfactorily, and those within roughly constructed frames with lights over them are ready for use—in fact, we have made our first gathering to-day of Laxton's Unique; this unmistakably shows the advantage in time which is obtained by means of such contrivances, apart from the consequent risks to which they are amenable when fully exposed. Tomatos,

ridge Cucumbers, and other half-hardy plants which have been somewhat hardened by exposure should be put out into their respective places without further delay. *G. T. Miles, Wycombe Abbey.*

#### FRUIT HOUSES.

**PINES.**—A fair share of sunshine has this year, so far, been of considerable importance in contributing towards the wellbeing of exotic subjects of every description—these plants not excepted. When we possess such seasonable influences they should be fully utilised, as under such conditions the growth in these plants may be advanced more expeditiously with safety from harm, providing proper care be bestowed on the ventilation, which, whenever a prospect of a sunny day is imminent, should be attended to early in the morning, because, in Pine cultivation, too much moisture cannot well abound within the houses or on the plants, subject to its being dispelled from off the leaves of the plants before powerful sunshine operates fully upon them. In order, therefore, to maintain such a condition, freely moisten all available surfaces about the house whenever they become dry, and especially is this required just prior to the closing up time, which should be sufficiently early in the afternoon to keep up the temperature at 85° or 90° for a considerable period afterwards. The outside condition of late will involve repeated syringings, and almost daily: this operation, however, must necessarily be regulated by the condition and character of the house and plants. In the case of the latter the axils of the leaves are the best criterion to go by; these during the growing season should never be allowed to become intensely dry, because many feeding roots exist around the stems of Pine plants which only derive support from this source. At this, the growing season, be cautious not to let any of the plants suffer from want or from an inadequate supply of water, and in all cases let this be improved by some stimulating agent, taking care to avoid giving it in strong doses. Give the requisite attention to shading; the thinner the material is for this purpose so much the better, as only enough shade is required to prevent the sun from scorching the leaves or fruit, as the case may be. Use no more fire-heat than is absolutely necessary in the fruiting or other departments. *G. T. Miles, Wycombe Abbey.*

#### FIGS.

When the fruit in the succession-house begins to swell for ripening, a higher and drier temperature will hasten maturity; but care must be observed in giving plentiful supplies of tepid liquid to the roots and syringing the foliage regularly, as any sudden check might prove injurious to the crop. As the Figs approach ripeness it will not be advisable to wet them if it can be avoided, neither will it be necessary, as atmospheric moisture can always be secured by keeping the mulching, walls and paths properly moistened; and this can be prevented from condensing on the fruit by maintaining a steady circulation of air with gentle fire-heat. When grown in a hot, dry house the Fig soon becomes infested with spider and scale, and as a natural consequence the ripening period is shortened—the trees rest simply because they are exhausted, and the second crop is puny, rusty and unsatisfactory; but feed them liberally with generous food, ventilate freely with heat, and syringe as often as they are divested of ripe fruit, and they will become perpetual bearers. The late Mr. Cramb had a very nice lean-to Fig-house, in which he allowed several large pot-trees to ramble root and branch, until the thin layer of rotten leaf-mould once used for plunging his pots in resembled a cocoa-nut mat. Feeding with liquid manure, syringing and ventilation, were not neglected; and although the trees presented a free and easy appearance, I never saw them through the summer months without an abundance of fruit in every stage of growth, not over-large, but beautifully coloured and of exquisite flavour. To keep a Fig in continual bearing, it must be constantly growing, and for this reason the extension-rod system well answers the purpose, as the leading shoots are allowed to extend without stopping until they reach the extremity of the trellis, when they are cut away at the winter thinning to make room for others succeeding them. Figs in cold houses and on open walls, notwithstanding the cold, wet, sunless summer of 1879, seem to be showing plenty of fruit, and in the event of a continuance of this bright sunny weather, they will be found very acceptable in August and September. Assuming that the roots are confined to reasonable limits inside the house, and that the borders are concreted and thoroughly drained with broken brick and old lime rubble, a material upon which they will live and thrive, the treatment recommended for succession-houses will apply, with this difference—in cloudy weather the afternoon syringing may be dispensed with, and in bright weather it may be performed early with all the solar heat that can be shut in, to insure the proper drying of the foliage before nightfall. The young growths in these structures should be trained a good distance apart, as overcrowding impedes the

free passage of light and warmth, so essential to the ripening of the fruit and wood. Neither is close stopping in cold houses a good plan, as it results in the production of a number of late growths which do not get properly ripened before the leaves fall; but the safest course is to secure firm short-jointed wood, and to allow the points to grow up to the glass, a position in which they will form an abundance of embryo Figs ready for swelling with the first flush of sap in the spring. *W. Coleman.*

#### ORCHARD-HOUSE.

The trees in the earliest house will now be in a condition requiring much water, the fruit either having passed through the stoning period or it will be now stoning. Inexperienced cultivators not unfrequently become alarmed at the condition of the fruit during this period, especially if they are anxious and of an observant turn. To all appearance no growth is made for several weeks, while the growth is as free as ever really, only it is inside the fruit; the stones are becoming matured, and growth of the fleshy parts of the fruit for a time ceases. It is during this period that a portion of the fruit drops off, although I must say this seldom happens if the trees are in good health, and the atmospheric conditions such that the trees require. If the fruit is stoning it is not desirable to over-heat the house, either by shutting up too early or by artificial means; indeed I would rather not shut up early, nor close the ventilators altogether during the night. Where the fruit has set and taken its second swelling, a high temperature just suits the requirement of the trees. See that they do not want for water at the roots, and thoroughly syringe them over twice a day. We have a garden engine that holds about 20 gallons of water; this is filled after the house is syringed, and the water is always about the same temperature as the house. In the original orchard-houses constructed by Mr. Rivers, or according to his plan, the ventilators are simply shutters or hinges to open outwards, and they must either be quite open or shut close up. The same successful cultivator recommended worsted netting to be placed over the ventilators to moderate the violence of cold east winds. This plan is certainly very desirable, especially near smoky towns, where the sooty particles are also caught in the meshes. Attention must be given to pinch the growing shoots. It requires some experience to do this right, as some of the shoots may not require to be stopped; others (the vigorous ones) should be stopped at the fourth or fifth leaf. The labour attendant on watering trees with all the roots inside of the pots now rapidly increases, and strict attention is necessary, as an hour or two of neglect may ruin the crop. *J. Douglas, Loxford Hall.*

#### PLANT HOUSES.

**ORCHIDS.**—Now that so many of these plants are in flower it is a fitting time to caution both owners and growers against the too frequent practice of allowing small and weakly plants to overflower themselves. Those who have been interested in the growth of Orchids, even for a short time, will have noticed how prone some species are to flower even after they have got into so debilitated a state that they have neither strength nor stamina left to push new breaks and roots. Such plants in their native habitats might throw one or more perfect flowers, and if such got impregnated might as a last effort bring to maturity a sufficient number of seeds to insure reproduction of species. Growers as a rule do not care in the least for Orchid seed, but would rather see some rare plant make good growth each year than that it should mature a peck of seed. Vigorous growth in every plant is the thing to be aimed at, carefully avoiding over-flowering, which is undoubtedly antagonistic to it. The cutting away of spikes immediately they show should only be done when the plant is extremely weak, and when it is thought that even bringing to perfection one flower might end its career. It is well known that flowering is, with a large majority of Orchids, part of their annual programme; to prevent them entirely from flowering is therefore certainly likely to bring them into irregular habits, not the least mischief of which would be to cause them to make their growth during a period well known by experience to be not the best for proper development. They would of course make their growth earlier, as they would miss the retarding influence of flowering. Such a weak-growing plant as the rare and chaste *Cattleya Reineckiana* would, if allowed, soon entirely exhaust itself by carrying one or more of its large flowers on every break it makes. Such plants can be saved either by cutting away the flowers so soon as they show, by thinning the buds out, or by gathering the flowers immediately they are fully opened. These flowers, if stood in the cool house with their ends in water, will retain their beauty for any reasonable length of time. It is almost unnecessary to say that thousands of such beautiful *Oncidium*s as *O. crispum*, *O. concolor*, *O. Marshallianum*, *O. Forbesii*, *O. pretextum*, and *O.*

*varicosum* have been irretrievably ruined by flowering too often, and by having to sustain for two or three weeks gigantic many-flowered spikes. After these plants have undergone the trying ordeal of importation they ought not to be allowed to flower until they have made a good supply of young roots. Even then it is wise to take the future into consideration, and by reducing the number or size of the spikes to husband the plant's strength. Judging from the numbers which have been sold there must at this moment be thousands of imported *Odontoglossum crispum* trying to recover themselves from the rough usage they have received. Those who possess any of these plants will, of course, be very anxious to see them flower, for there remains still the dread of *O. Lindleyanum*, and the hope of *O. Andersonianum* or *O. Ruckerianum* turning up. For this reason it is best when a spike shows up not to entirely remove it, but to leave just one or two flowers to determine the variety. The variety known, let the sole object be to grow the plant stronger and stronger, until it has so thoroughly established itself that it can bring to perfection yearly, without distress, a spike of from twelve to eighteen noble flowers. Should such a plant by any means get out of sorts ease it for one season of its flowers, and the chances are, all other conditions being favourable, it will regain its strength. Occasionally this and other *Odontoglossum*s, such as *O. Pescatorei*, will throw an extraordinary many-branched spike: on no account let such a spike remain on too long, or the plant may be permanently injured. A strong plant of *O. Pescatorei* here eighteen months back threw a spike of 101 perfect flowers; from this strain, although eased of all subsequent spikes, it is only just now recovering. Another Orchid, *Oncidium stelligerum*, threw two spikes of 240 flowers each, and got so exhausted that it actually failed to break for a twelvemonth. Perhaps no class of Orchids lose so much of value and appearance by over-flowering as *Vandas*, *Aerides*, *Saccolabium*, and *Angreecums*. Seldom indeed do we meet with a collection of these plants where the conditions of their existence are so nicely balanced that the plants make and retain ample foliage and also throw plenty of flower: quite common is it to see plants with abundance of flowers and with but little foliage. To right such plants it is necessary, not only to ease them for one season of their flower, but also to give them the whole year round a more generous treatment. This in many cases would mean less exposure to the sun, less air, more atmospheric moisture, and less fire-heat during the short dark days and long cold nights of winter. Many Orchids are injured when in flower by removing them from their moist-growing quarters to a dry and, what is worse, draughty place. To ask any cool Orchid to sustain its flowers in a dry atmosphere, is to ask it to work harder and eat less. Keep the syringe away from Orchids when in flower, and there will be no need to remove the plants to drier quarters. *J. C. Spyers, Burford Lodge, Dorking.*

#### TOWN GARDENING.

**LAWNS AND SHRUBBERIES.**—At the time of writing the drying east winds still prevail. We have had to cease mowing for a time, so brown is the grass getting in places through the drought, and if we do not get rain soon we shall have to use the hose. All spring-planted trees and shrubs should be well watered, and *Rhododendrons* coming into flower should have a good soaking, and the subsequent application of a good mulching of newly-mown grass will be a great advantage in protecting the roots from the drying winds.

**LOBELIAS FOR CARPET-BEDS.**—Lobelias should be used with great caution for carpet-beds. I have seen several beds where Lobelias have been used that would have been gems if it had not been for the failure of the Lobelia. I do not mean to say that they ought not to be used in carpet-beds, but they ought to be used with great caution, for the reason that they are out of bloom so soon, and make the bed look gloomy afterwards.

**SUCCULENTS FOR CARPET-BEDS.**—Succulents used too largely in carpet-beds, especially the green kinds, which have a rude or ragged appearance, the milky or glaucous-foliated ones being much the best. The most suitable place for succulents generally is a bed to themselves, or on a mound; set well up they have a very noble appearance, which there is nowhere shown to better advantage than on the "alpine point" at Battersea Park.

**BEDS AND BORDERS.**—All newly-planted plants should have special attention now, having the soil stirred up well around their roots, and then well watered. Annuals, which are very shallow-rooted, if not attended to in this dry time will fail to give satisfaction hereafter. Ornamental grasses form a very attractive class of plants when arranged either in mixed borders or in flowering beds. When dotted in a bed of scarlet or other *Pelargonium*s they have a very pleasing effect. *W. Gibson, Chelsea.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	May 24	Anniversary Meeting of the Linnean Society, at 3 P.M. Sale of Established and Imported Orchids, at the Auction Mart, by Protheroe & Morris
TUESDAY,	May 25	Royal Horticultural Society: Meeting of the Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 1 P.M. Sale of Bedding Plants at The Nurseries, Hornsey, by Protheroe & Morris.
WEDNESDAY,	May 26	Royal Horticultural Society's Conversation.

NOW that hardy herbaceous plants are regaining that attention they should never have lost, we may fitly call attention to the hardy EUPHORBIAS. At this season they are particularly attractive, from the profusion of their greenish-yellow flower-leaves, which in the bright sun gleam with an almost golden hue. There are several of them deserving cultivation—if cultivation it can be called—for, for the most part, they require merely to be stuck in the ground and let alone. Not the least handsome of these Spurges is *E. amygdaloides*, a common plant in copses and woods, especially on limestone soils: of this there is a variety with the leaves margined with white. Then there is the Caper Spurge, *E. Lathyris*, a tall-growing plant, with glaucous leaves in pairs, arranged crosswise—a noble-looking plant, which comes up almost a weed in some gardens. *E. Paralias*—as its name implies, a seaside plant—is another very distinct-looking object, and may be commended not only for its striking appearance, but also because, from the creeping habit of its rootstock, it is valuable on sandy or shingly sea beaches. *E. Cyprissias* is a low-growing kind, of neat habit and with dense linear leaves, which have suggested a resemblance to the Cypress. It is well suited for rockworks.

Then there is *E. pilosa*, a tall growing species with linear-oblong leaves and dense terminal tufts of greenish-yellow flower-heads, very striking in appearance, and in bright light very brilliant in colour. All these are natives of Britain, but they are by no means to be despised as border plants for all that. *E. corollata*, a North American species, is remarkable for the pure white of its floral leaves. It is a handsome plant, rarely met with now-a-days, but one well worthy of cultivation. *E. aleppica* is another half-shrubby species, with crowded, linear-oblong leaves and dense terminal heads of flowers. It also is one of those very striking plants which every one asks the name of when they see it, but which so few people cultivate, although there are few more distinct looking plants within the reach of the everyday gardener. *E. dendroides*, a noble species, which grows so finely on the shores of the Mediterranean, is rarely met with in our gardens. *E. Characias*, the species we now figure (fig. 114) from Mr. WARE'S nursery, is a remarkably handsome plant, native of the South of Europe, and long since introduced to our gardens though rarely met with. The flower-stalks are all about of equal length and verticillate, which gives the plant a different look from its near allies.

All these, as we have said, are plants of the easiest culture, and few of their class are more distinct and stately. All have milky juice, and may be suspected to be more or less poisonous. At first sight it would seem a strange association to put the fleshy Cactus-like species and the Poinsettias and Pedilanthus of our stoves with our Spurges, but the floral arrangements of all are nearly identical, and, we may add, exceedingly curious.

— THE PHYLLOXERA IN SOUTH AFRICA.—The recent order by the Government of Cape Colony, says the *Colonies and India*, prohibiting the importation into the colony of all kinds of foreign plants, with the intention of preventing the possibility of the introduction of the Phylloxera, was made the subject of complaint by a deputation which waited on the Secretary of State for the Colonies on Tuesday last. The dread of disease ever finding its way into the vineyards of Constantia was so great among all classes of colonists, that pressure was brought to bear upon the colonial authorities to prohibit the importation not merely of Vines, but of everything [considered] likely to harbour the pests. Grave inconvenience and considerable losses have been experienced also in the strict application of the prohibition to all kinds of vegetable products, and it is apparent that the full effect of the order was not foreseen when it was promulgated. In one case the importer of some Beech trees which had been sequestered and were about to be destroyed in accordance with the regulations, brought an action against the Government and obtained an injunction restraining their officers from destroying the trees on proving that it was not possible for them to harbour the Phylloxera. The facts brought forward by the deputation in opposition to the measure adopted by the Government of Cape Colony will, no doubt, receive careful consideration on the part of Lord KIMBERLEY. Though it is absolutely necessary that the Cape vineyards should be thoroughly protected from a disastrous invasion, it is not desirable that this object should be gained by measures which, it seems now proved, are unnecessarily stringent.

— THE VINE LOUSE LAWS.—A meeting of French horticulturists was held in the rooms of the Central Horticultural Society of France on the 6th inst., with a view of obtaining a modification of the absurd regulations recently enacted to prevent the spread of the Phylloxera. The members present protested against the absolute uselessness of the proposed interdict, and suggested certain alterations in the terms of the Convention of Berne, which while still leaving reasonable precautions intact, have for their object the doing away with absurd and mischievous prohibitions. MM. ED. ANDRÉ and LOUIS ANAT. LEROY are the secretaries of the committee. It may be mentioned that M. PLANCHON, who is one of the leading authorities on the Phylloxera question, gave in his adhesion to the proposals made for modifying the terms of the Convention of Berne, and it may be further stated that the fact that the insect will live on the Vine and on the Vine only, is asserted on the authority of the Academy of Sciences after careful experiment by the most competent observers.

— PHYLLOXERA IN FRANCE.—An official paper issued during the past few days states that the amount placed at the disposal of the French Minister of Agriculture and Commerce for the purpose of encouraging research and experiments as to the best way of dealing with the Phylloxera amounted in 1879 to 500,000 fr., and this will be increased during the present year by supplementary grants to 969,750 fr. Of this amount 200,000 fr. are devoted to the treatment of diseased Vines in the districts specified by the superior commission, while 250,000 fr. will be given to doubling the votes granted by the various departments and municipal bodies. Societies and companies formed for the investigation of the disease will also be assisted by bonuses to the aggregate amount of 300,000 fr. A further sum of 100,000 fr. is set aside towards encouraging the propagation of American Vine stocks and the distribution of new plants and cuttings from the Agricultural School at Montpellier. Rewards to the amount of 100,000 fr. will be given for furthering microscopic researches, and 50,000 fr. are left for dealing with individual cases. *Times*.

— NOTEWORTHY HARDY SHRUBS AT KEW.—In the Rhododendron dell, where some time ago we noted fine flowering specimens of *R. fulgens*, another, and a wonderfully different Himalayan species, is now in bloom. This is *R. blandfordæ*eflorum, which is represented by several forms of unequal merit. The finest of these is—in spite of its rather ugly habit—a very desirable plant, and its long, tubular, vivid orange-red trusses make a fine display. The other forms have smaller flowers of a greenish-yellow colour. On account of its sparingly leafy, twiggy character this species is unsuitable for planting singly,

but amongst other Rhododendrons where its defects can be quite hidden, it is well worth attention; it is one of the discoveries of the present Director of Kew, who found in Eastern Nepal and Sikkim at elevations of from 10,000 to 12,000 feet. A Californian Gooseberry, *Ribes subvestitum*, is just now particularly attractive in that portion of the Arboretum set apart for the collections of shrubby Saxifragaceæ; it is remarkable for the large size of its flowers, which have deep purple reflexed sepals and erect white petals—the entire blossom exhibiting a decided Fuchsia-like character. The Kew plant seems to be a finer form than that figured nearly a quarter of a century ago in the *Botanical Magazine*, tab. 4931, and differs from that in having copious aciculi on branches. Originally the species was sent to Messrs. VEITCH & SONS by LOBE. *R. speciosum*, another Californian species of the highest merit as a decorative wall plant, has strikingly handsome, deep glossy crimson flowers, with very long exerted stamens of the same colour; it has small, irregularly toothed oblong-lobed leaves, and the whole plant is spiny and glandular. Its prolonged season of flowering adds considerably to its value.

— OVER-CROWDING.—That was excellent advice an old gardener once gave to amateur cultivators of plants when he cautioned them against overcrowding their greenhouses, and pointed out the harm flowing from the practice. "Above all things, never be tempted to beg or purchase plants unless you have room for them; overcrowding is the great bane of English gardening. Many cram their gardens as manufacturers do their workshops, until debility and weakness take the place of vigour and health." It is a passion in human nature to acquire, hence it is that some with limited accommodation attend plant sales, and occasionally purchase many more plants than they require or have room for, and the consequence too often is great disappointment. It is far better to grow a few subjects, and cultivate them as well as possible; and there is much reason to believe that the amateur gardeners who get the most enjoyment out of their gardens are those that are termed "specialists," who make pets of two or three subjects, and give their whole attention to them. How many there are who have but little enjoyment out of their annuals, [because they sow thickly, and leave to flower all the plants that come up. It is much better to thin out the plants to an inch or so apart, pressing the soil firmly about those that remain, and giving them a top-dressing with some good soil. How can it be expected that plants growing close together, and that need room for development, can do well or produce flowers of a satisfactory character? If plants are to do well they should receive the warmth of the sun and the full benefit of refreshing showers; and they enjoy these best when standing a little isolated. Plenty could be written on this subject, but a few suggestions will suffice by way of illustrating the evils resulting from over-crowding.

— PRESERVING DAHLIA TUBERS.—A correspondent of the *Gardeners' Record* writes:—"Though carefully dried before storing away in the autumn, I used continually to lose them by the rotting of the crown, till at length it occurred to me it was occasioned through the decay of the long stalk left attached to the tubers; this becoming partially charged with fluid kept the crown constantly wet. My remedy has been to leave not more than 4 inches of stalk; from this to scrape the whole of the outer covering or bark, and at the base to make a small opening which permits any watery deposit to escape. The result has been, I have preserved the whole of my tubers, while experienced gardeners around me have complained of loss, notwithstanding that every precaution from damp or frost has been taken."

— LARGE CONSIGNMENT OF JERSEY POTATOS.—On Tuesday morning, May 11, the steamer *Guernsey* conveyed from Jersey to Southampton 1517 packages of outdoor grown new Potatos. The *Guernsey Advertiser* remarks that, considering the earliness of the season, this is an enormous quantity to export in one day.

— RUSTIC SUMMER HOUSES.—We understand that Mr. J. CAVEN FOX, of the Royal Horticultural Society's Garden, South Kensington, has recently received the warrant of appointment as manufacturer of rustic summer-houses, &c., to H.R.H. the Prince of WALES.

FIG. 114.—EUPHORBIA CHARACIAS. (SEE P. 656.)

— **BUSH FRUITS.**—The promise of fairly good crops of Gooseberries and red Currants is unfortunately considerably qualified by the too evident almost entire failure of black Currants, the produce on the bushes being of the most meagre character. Gooseberries are good where the bushes are well grown and the leafage abundant, but sparse where they are thin and starved. In some cases the latest wood of the red Currant bushes has been killed back for several inches by frost, and the best promise of fruit is where the bushes are sheltered by overhanging trees. Black Currant bushes appear entirely unaffected by weather, are very robust and healthy, but lack the one thing needful—fruit. The bloom came abundantly, but fell in the process of setting. Market growers, who are again likely to be so far heavy losers, generally ascribe this lack of fruit to the recent frosts, but it is exceedingly doubtful whether these, which have scarcely touched Potatos, were sharp enough to injure well-leaved and sheltered black Currants. It is too probable that the mischief was done during the hard boar frosts of January, whilst the fruit-buds were yet in embryo. Almost unique in this respect amongst deciduous shrubs, the black Currant plumps up its buds, just as though about to burst into leafage, early in the winter, and it is most likely that the intense frost of the winter then entered these stem-buds and injured the fruit-germs. This seems to be a more probable explanation than the one, also assumed, that the sunless summer prevented the due ripening of the wood because the growth of the black Currant is made very early in the season.

— **ROSE HOUSES.**—The taste for cut flowers which is constantly growing calls for the Rose as one of its favourite victims. In the open air Roses may be had in sufficient abundance if patience to wait for them can be exercised. With the introduction of the more robust Teas, such as *Maréchal Niel*, *Homér*, *Cheshunt Hybrid*, and dozens of others, have come a demand for their culture under glass, and thus the Rose-house is rapidly becoming just as much a garden adjunct as is the vinery or Peach-house. But there are few places in which Roses may not be grown under glass without any considerable outlay, and in structures that, perhaps little suited for other things, yet suit Roses admirably. At the Wilderness, near Reading, Mr. LEES, the gardener, has run up a low span-roof house, excavating the earth to permit of head-room inside, and forming borders both inside and outside for the Roses that are to run over the roof, which also are planted in the inside, but can thus permit their roots to range where they list. All the best kinds, and most suited for this mode of culture, are planted and are doing well. When the house is full of growth the quantity of flowers produced will be very large. In addition to these there are also growing in pots some very large specimen Hybrid Perpetual kinds, intended both for exhibition and to furnish cut blooms. These get plenty of light and air, and are vigorous and full of flower.

— **STANDARD FRUITS.**—The extraordinary tenacity with which the Apple bloom holds on compares well with its speedy fall a couple of years since, when the Apple crop was so thin; now the bloom is fine and vigorous, and on most kinds abundant, and further, is setting freely. Plums about London have set in immense quantities, and the crop bids fair to be enormous. Cherries have also set well, and as the bloom was unusually abundant this means a large crop. Standard Morellos were a beautiful sight when in bloom, and will be singularly beautiful when in fruit. This tree is most ornamental in both stages, and it would be good policy to plant it largely in pleasure-grounds, if but for the purpose of supplying the birds with plenty of food, rather than sending them to attack the cultivated fruits. Pear trees have suffered largely from frosts, the *Jargonelle* especially so, many trees being nearly dead; the bloom is thin, and the crop will be but moderate. A very singular feature in connection with the Apple may be seen in some West Middlesex market gardens. In one a large number of what were fine robust young trees of the *Wellington*, were last year so blighted that the fruit was valueless. The past winter has nearly killed these, and it will take several years to make them as good as they were a year since. In another a long row of fine young *King Pippin* trees were so largely affected by the severe winter that they have scarcely pushed a green leaf; the effect has been the same throughout the entire row. On the other

hand, many good old kinds on either side are full of health and vigour, and promise large crops of fruit.

— **MESSRS. CRIPPS' NURSERY AT TUNBRIDGE WELLS.**—A visit to a good nursery is sure to be a visit well paid to the lover of plants, whatever his special tastes may be. None have better opportunities of judging upon this point than those connected with the horticultural Press. Under this impression we recommend those who may have it in their power to avail themselves of the opportunity when it presents itself. The particular instance we have in view at the moment is the nursery of Messrs. CRIPPS, at Tunbridge Wells. There is enough in all conscience to gratify the lover of Nature in this town and its environs, and amongst its attractions for the plant lover not least is the nursery aforesaid. The main walk is bordered with choice specimens of choice Conifers and other ornamental trees and shrubs, which are sure to attract the attention of those who are interested in such matters. Here are to be seen in the form not only of small nursery stuff, interesting mainly to the proprietor, fine specimens more likely to attract the attention of the casual passer-by, noble *Araucarias*, good well grown specimens of *Abies polita*, *concolor* (*Lowiana*), *A. Pinsapo* (punished by the winter even in this favoured locality), *Thuopsis dolabrata*, *Cryptomeria elegans*, *Abies nobilis*, *Wellingtonias*, *Golden Ash*, *Weeping Larch*, *Retinosporas* of feathery aspect and golden and bronzed hue. All these, and many like them, are to be seen, while in the houses is a profusion of *Lapagerias*, of the best brands, such as the white, and the variety sent out by Messrs. FISHER HOLMES & CO.; the *Golden Larch* (*Abies Kæmperferi*) in quantities; *Torenia Baillonii*, which promises to be one of the best among decorative stove plants of its class; *Tacsonia insignis*, more beautiful even than the ever-lovely *T. Van Volkemii*; *Clematises* in profusion, for which this firm has a well-established reputation, but of which few were in bloom at the time of our visit; *Tea Roses* in plenty, but, as we can well believe, not too many to supply the ever increasing demand; *Blandfordias*, those showy Australian plants, whose beauty is not appreciated as it should be; *Yucca albo-spica*, with its singular leaves edged with white threads; *Weigela nivea*, remarkable not only for its beautiful white flowers, but also for the circumstance that its blooms are produced on quite small plants. These and a hundred other things that might be noted render even a passing visit to this nursery very interesting, and suggest what might be seen on a more thorough examination.

— **THE WEATHER AT EDINBURGH.**—The following is an abstract of a paper read by Mr. SADLER, Curator of the Royal Botanic Garden, Edinburgh, at a meeting of the Botanical Society, on the 13th inst.:—Throughout the month of April there were generally low night temperatures, with bright sunlight during the day, while the wind, with one or two exceptions, was continuously either northerly or easterly. The thermometer was at or below the freezing-point on six occasions, while in April of last year it was so thirteen times. The following were the six lowest readings:—April 2, 27°, or 5° of frost; April 4, 30°, or 2° of frost; April 12, 30°, or 2° of frost; April 26, 30°, or 2° of frost; April 27, 28°, or 4° of frost; April 30, 29°, or 3° of frost. For the month there were registered 18° of frost, as compared with 19° for the corresponding month last year. During the first part of April there was somewhat changeable weather, with bright sunshine, showers of rain and hail, and the wind in the north-east. On the 16th the wind changed to the south-west, which raised the temperature considerably. The wind gradually increased until it reached the violence of a storm, and ended in a heavy fall of rain. On the 22d it changed to the west, then to the north, and ultimately settled in the north-west, thus verifying the excellent meteorological observations of King SOLOMON, "The wind goeth towards the south, it turneth about unto the north, it whirleth about continually, and the wind returneth again according to its circuits." At this stage an electric condition occurred in the atmosphere, which resulted in a thunder-storm, with hail and rain. After this there were frosty nights, and during the day very bright sunshine and cloudless skies. During the month 140 species and varieties of alpine and herbaceous plants came into bloom in the rock garden. Since

the present month (May) commenced the thermometer has been at or below the freezing-point on three occasions, viz.:—May 5, 30°, or 2° of frost; 8th, 29°, or 3° of frost; 9th, 32°. The cold dry easterly and north-easterly winds still continue, and are retarding the progress of vegetation to a great extent. Notwithstanding, vegetation is far in advance of the corresponding period last year. Since May 1 forty-five species and varieties of plants have come into flower in the rock garden, which is at present very attractive to all admirers of alpine and herbaceous plants. The members afterwards enjoyed a walk in the gardens under the guidance of Mr. SADLER, who pointed out the principal novelties in flower.

— **GOLD-LACED POLYANTHUS.**—Intending raisers of seedling gold-laced *Polyanthus* will do well to avoid seed saved naturally from the best named kinds. A bed of about six hundred seedling plants, raised from seed saved without cross fertilisation from that best of all laced kinds, *Cheshire Favourite*, has given the most shocking lot of rubbish—so inferior, indeed, as to show what the progenitors of the *Polyanthus* were perhaps two hundred years ago. The best seed is got from pin-eyed flowers of a fairly good strain that have been crossed with pollen from the best kinds. It was in this way that Mr. BARLOW obtained his beautiful seedling, *Sunrise*. Quality, left to itself, seems but to generate a miserable progeny; but adding to quality new robust blood, and something good will, as a rule, result. The best average seed strain is found in kinds that are robust, are fairly well marked, and have a good proportion of pin-eyed flowers, as these are usually cross-fertilised either by insects or the passing air. It is worthy of note that the seedlings from *Cheshire Favourite* give plenty of size and strength, but all lack the one property of the parent—quality; this evidently can only be had by intercrossing.

— **APPLES.**—There is no fruit more popular with the English people than is the Apple, and probably none more wholesome or useful. As an article of trade it excels all other hardy fruits, and its long-keeping qualities make the Apple as available over a long season as is the Potato amongst vegetables. The prospect of a crop, therefore, becomes a matter of considerable moment, not merely to the market growers, who have to live by their crops, but also to the numerous persons who make it an article of sale and barter, and, though last not least, to that most numerous section of the community, the consumers. We have passed through the customary spring season known as *Blackthorn winter* with safety. Cold winds and very moderate frosts, owing to the exceeding dryness of the atmosphere, have done but a minimum of harm, and the Apple bloom is sound and uninjured. Lately the Apple orchards have been all aglow with colour; the bloom being most abundant and apparently vigorous. On many trees the bloom presented a glorious spectacle, the rich rosy-red hues being almost unequalled amongst hardy flowering trees. The popular *Manx Codlin* is perhaps the most floriferous, whilst the late *Wellingtons* as a rule have least bloom. Very largely last year these trees suffered from the excessive wetness of the summer and absence of sunshine. The growth was stunted, the leaves blighted or charred, the fruit mere scrub or rubbish. The past hard winter has severely injured the late unripe growth, and wherever these features were presented the trees have so much suffered that it will require two or three favourable seasons to bring them back to health and fruitfulness. Nearly all other kinds, however, are presenting a most encouraging appearance, and there is hope that, spared any further visitations of frost and biting wind, we may have a really good Apple year. That the crop should not be too abundant is almost to be desired, as this means few or no Apples the next year. We must, however, be pleased to accept the goods the gods provide, even if they give us rather more than for the time we can profitably utilise.

— **THE WINTER GARDEN AT KEW.**—Besides a wealth of *Acacias* and other equally well known greenhouse plants, there are in this house a number of fine ornamental plants which deserve to be more generally cultivated. In the north octagon are some fine pots of *Agapetes buxifolia*, a lovely *Vacciniaceae* shrub from Eastern Bhotan, where it grows epiphytically on the moss-covered trunks of trees in

damp forests at elevations of from 2000 feet to 3000 feet. Under cultivation it grows remarkably well in peaty soil, and its long coral-red tubular blossoms contrast well with its deep green, glossy leaves. *Jamesia americana*, a rare Rocky Mountain Saxifragaceous shrub, with softly pubescent leaves and terminal cymes of white flowers, is worth a place even in a select collection of cool-house plants. *Viburnum plicatum*, a perfectly hardy Guelder Rose, of dwarf habit and free flowering qualities, forces readily and makes a very attractive object. So does the common Broom, if grown in pots and kept nicely pinched in—indeed the display made by this common native shrub puts into the shade completely scores of rare and valuable exotics. Grown under these conditions, too, the leaves develop at the same time as the flowers, thus adding to the effect. One of the most curious and interesting of the Azaleas is the rare Japanese *A. linearifolia*; it is a small bush covered with spreading red-brown hairs, the leaves are narrow, linear-lanceolate, and the colour of the long narrow petals is a reddish-purple. *Vaccinium caracasenum* flowers freely in a young state; it has neat, box-like leaves, and clustered, terminal racemes of waxy white flowers.

— THE ARBORETUM AT KEW.—This is year by year becoming more "ship-shape," though without a plan the visitor is still "in wandering mazes lost." Something has been done of late in placing direction labels—"To the collection of Elms, Oaks, &c.," as the case may be, but much more needs to be done in this direction. The buds and young foliage of many of the trees are, as any practical forester knows, as characteristic, and in some cases more so, than the fully-developed foliage. Moreover, the spring tints of many of the trees are as beautiful if less intense than the autumn coloration. Take, for instance, the Oaks, wherein we may note the purplish bronze of *Quercus pubescens*, the deep olive of *Q. Bruta*, the golden-yellow of *Q. Louetii*, the coppery tint of *Q. cuprea*. The Oaks and the Elms may be found by the riverside facing Sion House, and divided one from the other by the noble Horse Chestnut whose branches dip down and kiss Mother Earth, and, as it were refreshed by the contact, uprise again on all sides. The bloom on the Horse Chestnuts is comparatively scanty this year. The Rhododendrons are not yet quite in full beauty.

— AN ORCHID SHOW.—Some of Mr. BULL'S houses in his annexe at Chelsea are just now a sight to be seen—a profusion of *Odontoglossum crispum* (Alexandre) and an equal wealth of *O. vexillarium*. Of the many scores of each scarcely two are alike, size, form, hue all different, yet all alike are beautiful. Contrasted with them is a fine batch of *Epidendrum vitellinum majus*. In smaller numbers are the singular *Masdevallia bella*, *Odontoglossum Hallii*, *O. cordatum*, with its white lip shaped like an ace of spades; *Masdevallia Veitchiana*, with its inimitable colouring; *Vanda Denisoniana*, a rarely seen Orchid, with ivory-white flowers of great substance; and many others. The collection of *Sarracenias*, *Droseras*, *Dionceas*, and other so-called insectivorous plants, is very large and attractive.

— EDWARD SMITH HILL.—The *Sydney Morning Herald* records the death of Mr. EDWARD SMITH HILL on March 17, sixty-one years of age. He was a native of Sydney, and, after retiring from business, devoted his time to scientific investigations for the last eighteen years. He made a voyage to the South Sea Islands, and wrote some valuable papers and pamphlets on their flora. He wrote for the New South Wales Government a report on the flora of Lord Howe Island, and the condition of its European inhabitants. Among his contributions to Sydney journals was a series of articles describing the fishes found in the harbours and rivers of New South Wales and along the coast. He was a great friend of the aborigines, and they looked upon him as a chief, and made his grounds their head-quarters whenever they came to Sydney. *Times*.

— IXIOLIRION PALLASII.—Mr. BARR sends us cut flowers of this very beautiful Amaryllidaceous bulbous plant. The stems are slender, with long grass-like leaves, and bear a terminal umbel of long-stalked, funnel-shaped flowers, with an inferior ovary, and six narrow, deep violet recurved perianth segments. The plant is a native of the Southern Cau-

casus and Turkestan. According to the *Gartenflora* there are several varieties of this plant, varying in colour from deep violet to pink.

— ROYAL NATIONAL TULIP SOCIETY.—The meeting of this Society for the present year has been fixed to take place on Saturday, the 29th inst., at the Manchester Botanical Gardens. The schedule of prizes has been issued with the notice of the meeting, and provides nine classes for rectified Tulips, and four classes for breeders. Schedules may be obtained of the Honorary Treasurer and Secretary, SAMUEL BARLOW, Esq., Stakehill, Castleton, near Manchester.

— EFFECTS OF FROST ON PEAR BLOSSOMS.—It has been frequently observed that in Pear blossoms the effect of frost on the bud is not apparent for some time. At last all are found to be abortive in consequence of the frost having destroyed the stigma while the other points are uninjured. The yellow form of the Crown Imperial has been affected in the same way, except that the sepals and stamens have never been fully developed, though apparently untouched by the frost, while the stigma and style are brown and dead. *M. J. B.*

— INDIAN TEA.—Those unacquainted with the progress of Tea-growing will be astonished to learn that, whereas the Indian yield in 1870 amounted to slightly more than 13,000,000 lb., it had been nearly trebled in 1878, when it was 37,000,000 lb., and that this year's harvest is estimated to give 70,000,000 lb. of Tea. That the rate of production should be almost doubled in two years is indeed marvellous, and affords another instance of the grand resources of our Indian Empire, which, by-the-by, some few prejudiced agitators would have us believe is a useless and expensive dependency of the British Crown. The demand for Indian Tea in the United Kingdom has increased amazingly of late, and is increasing every day; and we have no doubt whatever that Indian growers will find a ready market in our Australian colonies by means of which both producer and consumer will be abundantly benefited. *The Colonies and India*.

— WHITE-MONDAY AT KEW AND SOUTH KENSINGTON.—Kew Gardens were visited on Monday by 62,000 persons, or 5000 more than in 1878, which, we believe, was a full year. At the Royal Horticultural Society's Gardens 19,188 persons passed through the turnstiles on payment of 2d. each.

— TOWN GARDENING.—Messrs. J. & R. THYNNE, of Glasgow, have recently executed a very unusual order for JAMES CARTER HAUGHTON, Esq., of 20, Devonshire Place, Portland Place, W., and which well illustrates how much may be done in the way of town gardening by those who have a love for plants, and the means to gratify so pure a taste. Under the personal superintendence of Mr. J. THYNNE McCALLUM, the firm in question have built and completely furnished for Mr. HAUGHTON a range of glass 120 feet long, divided into five compartments, four of them hip-roofed and 20 feet wide, placed in pairs on either side of a larger structure, intended to be kept decorated as a show house. The first and second divisions are designed for the cultivation of Orchids and fine-foliaged plants respectively, and each has a plunging-bed 3 feet wide in front, a path 4 feet wide, with staging against the back wall, which in turn has been wired and lined with moss. In the Orchid-house *Bomarea Carderi*, *Dipladenia Brearleyana* and *Stephanotis floribunda* have been put in position for occupying some wires under the roof, from which also hang numerous small *Nepenthes*. A small but choice collection of Orchids, which included a fine specimen, amongst others, of *Dendrobium Dalhousieanum*, and *Vanda suavis* with five spikes of sixty-six flowers, has already been got together. The fine-foliaged plant-house contains a great variety of subjects of this character, mostly small and in the bloom of youth, but including a sufficient number of handsomely-furnished specimens of the finest new sorts of *Dracenas*, *Crotons*, and *Palms*. The show house is gay with *Pelargoniums*, *Heaths*, *Calceolarias*, &c., toned down with *Palms* and other fine-foliaged plants, such as the Norfolk Island Pine, *Yucca aloifolia variegata*, and *Encelphalartos*, &c.; while on the roof are trained *Lapageria rosea* and *alba*. The next compartment is a fernery with a rockery at the back, which, when the

plants grow up, will be nicely clothed; and the last house is to be employed in the growth of plants to produce cut flowers, for which purpose a range of heated frames about 80 feet long has also been erected in front of the houses. Perhaps, however, by far the most pleasing bit of Mr. McCALLUM'S handiwork is a combined plant case and aquarium, which has been erected in the house at the head of the first flight of stairs, and which is certainly one of the happiest examples of permanent decoration of this character that we have ever seen in any mansion.

— THE RHODODENDRON SHOWS.—Arrangements have been made with the Messrs. J. WATERER & SONS, of Bagshot, for a display of Rhododendrons in June next, to be held in the gardens of Cadogan Place, Sloane Street. We also understand that the plants from Knap Hill, which are to form the exhibition in the Royal Botanic Society's Garden this season, are already in their places.

— SOUTHGATE HORTICULTURAL AND COTTAGE GARDEN SOCIETY.—The annual show of this Society will be held on July 3, in the grounds of Holmwood, Southgate, the residence of J. N. MAPPIN, Esq.

— LAW NOTES.—We quote the following from a Scottish newspaper:—"JOHN SUTHERLAND, nurseryman, Greenock, sued Mr. REID, shipbuilder, Glenhutton, Port Glasgow, for £8 9s., as the price of bulbs, plants, seeds, supplied to defendant through his gardener. Defender repudiated the claim on the ground that he had not ordered the plants, and only learned of the transaction when the gardener, who, it seems, had given the order, had left his service. The evidence led showed that it was a very general custom with gentlemen's gardeners to order plants, &c., for their masters' garden without having previously obtained their master's sanction. The Sheriff held that it had been proved that this custom was pretty general in the trade, and on that ground decreed for the pursuer for the amount claimed."

— THE WEATHER.—General remarks on the weather during the week ending May 17, issued by the Meteorological Office, London:—"The weather has again been generally clear and very dry in all parts of the kingdom; in Ireland, however, the sky was cloudy or overcast at the commencement of the period. A thunderstorm occurred at Loughborough on the 11th, and a second in some parts of southern England on the 15th. The temperature has been several degrees higher than during the week ending on the 10th. It was equal to the mean, for the corresponding period in the thirteen years 1857-69, in "England, S." and "Ireland, S.," but below it in all other districts. On the 14th and 15th the thermometer was much higher than at any other time during the period, and in the south of England very high readings were registered—the maxima being 78° at Southampton, and 75° at Hastings and in London. The nights were rather sharp, and some slight frosts were experienced at some inland stations. The rainfall was scarcely measurable in any district; the largest amount was two-tenths in "Ireland, S." Bright sunshine shows a marked increase over Great Britain, but scarcely any alteration in Ireland. The number of hours registered was greatest in "England, N.W.," and the least in "England, N.E." and over Ireland. The wind was between north-east and east all over the country. In force it was light in the north, but generally fresh or strong elsewhere, and at the close of the period blew with the force of a fresh gale on our southern coasts and in the Channel.

— LORD BACON ON THE ROSE OF JERICO.—Turning over BACON'S *Sylva Sylvarum* we lighted upon the following curious paragraph, which probably refers to the Rose of Jericho, *Anastatica Hierochuntica*. The paragraph has the marginal title, "Experiment Solitary touching Plants without Leaves," and runs thus:—"There be scarce to be found any vegetables that have branches and no leaves, except you allow Coral for one. But there is also in the deserts of S. Macario in Egypt a plant which is long, leafless, brown of colour, and branched like coral, save that it closeth at the top. This being set in water within house spreadeth and displayeth strangely; and the people thereabout have a superstitious belief that in the labour of women it helpeth to the easie deliverance."

— GARDENING APPOINTMENTS.—Mr. HENRY FALKNER, late Gardener to H. WELCH THORNTON, Esq., Beaupaire Park, Basingstoke, has been appointed Gardener to EDWIN CRAWSHAY, Esq., Blaisdon Hall, near Gloucester.

## ANACARDIUM OCCIDENTALE.

THE tree bearing this name is one common to the tropics, its favourite home being on hot plains in situations exposed to the full blaze of the sun. Its fruit is the well-known Cashew-nuts (pronounced Koosho in Jamaica), which are borne on a peculiarly enlarged and fleshy pyriform pedicel of a beautiful crimson or yellow colour. The tree is of quick growth, bearing fruit in suitable situations in about three years. It flowers during the months of February, March, and April, ripening its fruit from the latter month to the end of June. The succulent portion is used in a variety of ways, but varies much in flavour with the individual tree, some being very astringent, while others are deliciously refreshing when eaten fresh. It is preserved in many ways, but in the candied state is in its best form, it then being scarcely distinguish-

kernel is described in *Dict. Mat. Med.* i. 275, as having the effect of exciting the faculties, especially memory, and is called "Confection des Sages." It is commonly sold here prepared in sugar, similar to Almonds, but whether it has the effect mentioned requires further proof. *J. H., King's House, Kingston, Jamaica.*

## SEMPERVIVUM DISEASE.

It often happens that a disease which only produces slight effects amongst wild or hardy plants will, if it attack carefully nurtured plants, prove deadly in its results. Such has been the experience of horticulturists with the fungus of the Potato and Tomato murrain and the disease of Hollyhocks; in each instance the distemper has been slight amongst wild plants and disastrous amongst cultivated ones.

the leaves as if by insects; in fact a more wretched and hopeless case we have never seen.

As we are not acquainted with any published figures of this pest we here illustrate its appearance as seen under the microscope. In fig. D is seen a section of the leaf of *Sempervivum monticolum*, enlarged 5 diameters, showing the roundish pustules (peridia as they are termed by botanists) immersed within the tissues of the leaf: hence the name of the parasite—*Endophyllum*. Some of the peridia have burst their fine cellular coat and opened their mouths, and can be seen discharging the spores with which they are at first densely filled.

At E is illustrated a section through a flask enlarged 20 diameters, and it will be seen at a glance how innumerable are the contained myriads of minute seeds or spores. How many hundreds of thousands or millions of these reproductive bodies are contained within each peridium, flask or pustule, or within one leaf, or on an entire plant, may perhaps be imagined, but can hardly be calculated. There are probably enough spores on one plant to infect every plant of *Sempervivum* in Europe. Some of the spores are emerging from the mouth of the peridium, others are seen resting on the surface of the leaf. It may be remarked how much smaller the spores are than the constituent cells of the leaf.

The spores themselves are still further enlarged at

FIG. 115.—A FUNGUS—ENDOPHYLLUM SEMPERVIVI—ATTACKING SEMPERVIVUM MONTICOLUM. A, ENTIRE PLANT; B, C, LEAVES.

able from fine Eleme Figs. The juice of this part stains linen with an indelible dark brown spot wherever it falls, and it is also frequently used as a remedy in attacks of dysentery.

The nut is one of the favoured delicacies of the country when properly prepared, in which consists the chief secret of its quality. It is kidney-shaped, of a light lead colour, containing between its integuments numerous cells filled with a very caustic oil. To prepare for use the nuts are placed in some shallow, thin, metallic vessel over a slow fire in the open air. They are heated until the oil contained in the integuments takes fire, and stirred briskly until it is consumed; being then removed from the fire they are carefully cracked, and the roasted kernels removed and placed in hermetically sealed bottles until required for use. They are equal if not superior to any nuts found on the best tables in European countries. During the flowering season, and immediately previous to it, a fine transparent gum exudes from the tree, useful for many purposes in place of gum-arabic, but it cannot be obtained in large quantities.

Macfadyen mentions that a preparation of the

Botanists have long been acquainted with a disease of the Houseleek produced by a fungus named *Endophyllum sempervivi*. The fungus is very rare, or *Sempervivum tectorum* must be easily able to withstand attacks of the parasite, for plants affected by the fungus have seldom been seen by any one.

A few days ago a firm at Chester sent on to us an entire plant and some detached leaves of *Sempervivum monticolum*, badly affected by the parasite, *Endophyllum sempervivi*. The entire plant was dead, and nothing could exceed the miserable condition of the specimen, of which we here append an illustration (fig. 115). The leaves were covered with pustules, blistered and withered, and with edges corroded away by the attacking fungus. Every part of the dead plant was finely dusted over with the orange-coloured spores of the parasite. The leaves, of which two are illustrated natural size in figs. B and C, were still green, but thickly covered on both sides with ulcerous spots, each spot discharging innumerable orange-coloured spores. Many of the pustules were confluent, as in bad cases of small-pox, and numerous patches were eaten out of the edges of

FIG. 116.—D, SECTION THROUGH AFFECTED LEAF, MAGN.; E, SECTION THROUGH PUSTULE, MAGN.; F, SPORES, MAGN.

F to 320 diameters, and when thus magnified it becomes apparent that each spore, minute as it is, is furnished with a distinct skin or bark, which encloses the vital material within.

*Endophyllum* is a close neighbour with the *Rcestelia* parasite of the Pear, with the *Peridermium* of the Scotch Fir, with the *Æcidium* of the Berberry (said to be a condition of the corn mildew), and of many too well-known pests of garden fruits and flowers.

There can be no doubt but infected plants are highly dangerous amongst collections of *Sempervivum*, and we are, therefore, glad to hear that the nurserymen in question have destroyed all their affected plants. Should the disease, however, appear elsewhere and gain a mastery, *Sempervivum* may probably soon be in the same condition as the Hollyhock, the Potato, and the Tomato. If one could stop the ravages of these pests it would indeed be a good thing. Many minute fungi can be destroyed by a dilute solution of permanganate of potassium, but there is a difficulty in its thorough application so as to ensure the solution coming into contact with all the affected parts. *Worthington G. Smith.*

**BAHAMAS ORANGES.**—The Orange crop gathered on the island of New Providence (Bahamas), and exported, amounted to four and a half millions in quantity, and to over £6500 in value. The crop from the whole colony amounted to seven millions in quantity, and to more than £10,000 in value. *The Colonies and India.*

## Home Correspondence.

**Plants Changing their Name.**—My friend, Mr. Harpur-Crewe, to whom I sent a flower of the plant praised by me in last week's *Gardeners' Chronicle* under the name of *Heuchera botryoides*, writes me word that he has it as *Mitella bifolia*, or *M. levis*: no doubt his names are more correct than mine, as he is a far better botanist, and lives nearer to botanical centres; but may I ask what is to be the limit of this name-changing nuisance? My friends will compare me with Gracchus, complaining of sedition, for I confess to having changed my name twice in my life; but then a prescribed and legitimate method was employed. A formal document was drawn up in the Herald's College and signed in one case by King George IV., in the other by Queen Victoria, and published in the *London Gazette*, and last, but not least, it cost £120 each time; but plants seem to change their names as often as they please without notice and without authority. [Unluckily without having to pay fees. Eds.] It is true that the question of scientific names may be complicated by being an international one, but what botanical king authorised the change of name of our old friend, St. Bruno's Lily, first from *Anthericum* to *Paradisica*, and now from *Paradisica* to *Czaekia*, and in what *Gazette* was the change advertised?—and when did the China Aster take the name of *Callistephus*? That worthy florist, Mr. W. Thompson, of Ipswich, whose name I mention with honour and respect for the services he has done to horticulture by collecting and distributing the seeds of choice plants, when I wrote to him, remonstrating with him for having no China Asters in his seed catalogue, wrote in reply that there is a morality amongst botanists which forbids them to continue to call a plant by a name which they have found out to be wrong. But why can they not find out the right name at first? and how much must we regret that Solomon's work on universal botany has been lost! But probably modern botanists would not have respected his classification and names any more than they have those of Linnæus. If I am asked what harm I suffer from these changes, I answer that I often write for an advertised catalogue and order some two dozen plants which I do not know, on the faith of the recommendations contained in it, and find when they come that one-third or more of them are old acquaintances under an *alias*, and this, it must be admitted, is very provoking. *C. Wolley Doil, Edge Hall, Malpas, Cheshire, May 15.* [Where possible and not misleading it is better, in gardens where accuracy is not a *sine qua non*, to use the English names, such as China Aster. To take an instance from chemistry, a dozen different names have been given to Calomel, in some cases leading to dangerous mistakes. In such a case unscientific people had better adhere to the names that do not change. Eds.]

**Cantua dependens.**—I send you a few sprays of *Cantua dependens*, that you may see what a strikingly beautiful thing it is for growing up the pillars of a light conservatory—the way we have it here, where two plants, one on each side of the main entrance, are now clothed from base to summit with their lovely pink flowers. As these plants are some 12 feet high and 3 feet through, well furnished throughout, some idea may be formed of the splendid display they make, as nearly every shoot is terminated with blossoms like those brought under your notice. I cannot claim any credit for cultural skill in this, as all the attention the plants have is about the same as that afforded to the rest of the climbers, except that these, being subject to red-spider, get a dusting of sulphur occasionally during the summer after having been syringed; and when it is thought that this has done its work in making matters uncomfortable for the insects, it is washed off by using water with some force from the garden engine, which attacks, with the aid of the sulphur mentioned, keep the foliage in a tolerably clean healthy condition. Greenfly, too, is often troublesome, and as we cannot smoke the house owing to its connection with the mansion, we have recourse to tobacco-water or powder, either of which has the desired effect in ridding them of these pests. Generally, the *Cantua dependens* is considered very shy blooming, and from these being so exceptional I am inclined to think that their free-flowering habit is brought about by the exposure they get, as they are close to a clear plate-glass front, where all the shade they receive is from the pilasters behind, and as the atmosphere is always very dry, the wood must of necessity get thoroughly ripened and hardened. I am the more confirmed in this opinion from the fact that the plant which makes least growth looks the most mature, always blooms the best, and yet the summer of last year cannot have helped either much, but for all that I have never seen them better. Both plants were turned out in their present positions twenty-three years ago, and the

borders they are in are only 15 inches wide, and about 8 feet long, the soil in which bricked-in space has to be shared with a Passion-flower and a *Trachelospermum jasminoides* in the one case, and a Passion-flower and *Kennedyia* in the other, which furnish the girders and adjacent pillars. Although these two *Cantuas* are only of the height stated, I am convinced that they would have gone right across the roof of the house long ere this had we so desired, but as they are so satisfactory where they are, and would not associate so well with *Passifloras* as do *Begonias*, *Tecomas*, and *Tacsonias*, we have never carried them further. Their pendulous habit, however, quite fits them for roof plants, and I would strongly advise those who have not a light wall or pillar on which to train, to try one in the above-named position. The soil we have ours in, and which has never been renewed or added to, is a light turfy loam with a good deal of sand in it, and the drainage being free, we give plenty of water when the plants are growing. *J. S.*

**Single and Double Flowers.**—Flowers, as we find them in a state of Nature, are nearly all single, that is, the organs of reproduction are simply so far enclosed by their covering of sepals and petals as suffices to protect them through their advancing stages and until fertilisation has taken place. Double flowers, it is needless to say, are usually the outcome of an exuberant condition resulting from cultivation, whereby the plant is fed up to a state of repletion that must find vent somewhere, and in so doing forces the stamens to an unnatural development, which results in their extension so as to increase the number of petals, by which means the flower becomes more or less double. In the case of some flowers this condition, as seen from the florist's point of view, is looked upon as an advantage, notably with plants such as the *Dahlia*, *Hollyhock*, *Ranunculus*, and others. The cause of the preference for double flowers is twofold; first, a full globular or broad circular form comes nearest up to the florist's standard, as opposed to the more loose, narrow-petalled but more elegant shape usually met with in flowers in their natural state. Beyond this there is no question that double flowers last longer than single ones, which alone is so much gain, especially in times like the present, when the effect which a flower produces as it is seen on the plant is only half the consideration on which its merits need to be assessed, the length of time it will last when cut being now, and likely to continue, of equal importance with that of its appearance when growing. Yet, although durability is a very desirable property, and one that, when writing on the subject of flowers for cutting, I have before this urged, still it would be a mistake to attach more importance to it than it deserves, and to lose sight of the fact that single flowers have an elegance about them which double ones are almost always deficient in. This to me was never more apparent than in looking at the double varieties of *Cineraria* that have recently made their appearance, flowers that, so far as being perfectly full and double, are very much in advance of other double ones that have preceded them; but for all that constitutes simple elegance in form and pleasing contrast in combination of colour, they are not by any means equal to the single varieties. Double *Fuchsias* are not nearly so handsome as the single kinds, and except as novelties have never been held in such estimation. The flower when double loses much of its natural elegance, and in this state what is gained in size of flower is lost by the inability of the plants to produce numbers equal to the single sorts. The superiority of the single varieties of *Dahlias* which have recently been brought under notice for use in arrangements of cut flowers, over the double forms of the plant, is most decided. The tuberous rooted *Begonias*, of which such immense numbers have of late years been raised, are now making their appearance in double form; but few people, I think, will look upon them as improvements on the single kinds—rather the reverse. Even the large massive single varieties of recent date, considered by many more deserving than the productions from seed that preceded them, have attained size at the expense of elegance in form of flower, and decidedly so in the general habit of the plants. With these and a good many other things it is quite possible to get too far in one direction, particularly if those who take the lead in the raising of new varieties are not careful to breed from sorts that possess a graceful habit of growth. In saying this much let me not be misunderstood—no one is disposed to stand up more stoutly for the florist's highest standard in such flowers that have hitherto been understood to come legitimately within the good old muster roll of the florist, but there is now the manifest mistake being made of ranging under the florist's standard and bringing within the florist's code of properties, every flower that is sought to be improved or altered; indeed sometimes the alteration lacks the improvement. The day for this has gone by, for if there is one thing more than another now apparent it is the perception and appreciation of simple beauty in natural objects, flowers included, by the majority of

people who may be said to come fairly within the influence of education. And it would be a wonder if it were otherwise, even so far as regards the lower grades of society, for every town and every village that is large enough to possess a Mechanics' Institute has its drawing-school, and the pupils do not exercise their pencils in delineating pedigree cattle or prize florists' flowers, but choose subjects which are nearer the state to which Nature and ordinary cultivation have brought them. *T. Baines.*

**Chamærops Fortunei and Bambusa Metake.**—It will, I think, be readily admitted that the winter has been severe enough to test the powers of endurance of most plants, and that those which have passed through it without protection may be safely considered as hardy and treated accordingly. I am glad, therefore, to be able to say that *Chamærops Fortunei* and *Bambusa Metake* have stood unscathed, and that in cases where they have not been exposed to cutting winds they are now looking as fresh and green as ever. Taking into consideration their highly ornamental character, the wonder is they are not more extensively planted, and more particularly so as regards the Palm, which in prominent positions in the outdoor fernery produces a most striking effect. Where it shows best in such situations is on irregular-shaped mounds, as elevated in that way its bold outline and fan-shaped foliage rising from its shaggy tree-like stem is seen to great advantage, and by associating suitable Ferns with it a most pleasing and natural group may be formed. Not only is it fine in the summer retreat already mentioned, but it is equally so in certain sheltered spots on lawns, where, backed by other plants of bold type, it helps much to break up the too regular outline of shrubs, and to give more character and finish where such things are used. *Bambusa Metake* is so easy looking that it cannot well be misplaced, but as it is of a reed-like habit it is specially adapted for planting near the margins of water, over which it droops and waves gracefully, and looks quite at home. Unfortunately, *Thamnocalamus Falconeri* (*falcata*), the most elegant of all the Bamboos, is much too tender to stand such winters as last without protection, and even with all that can be done in that way it is impossible to save the canes, which get killed down to the harder and more mature parts near the crown, from whence, if the soil and situation suit, they break again and make rods of a great length. I regret to record that all the fine plants we had of this fine grass are now dead, their demise having been brought about through flowering and seeding, which the whole of them did some years back, and which was remarked on at the time. What was most singular was, that this effort at flowering was general throughout the kingdom, and resulted in most cases in utterly exhausting the plants. Here they never started again, although the rods looked green and fresh, but they have done us good service in affording neat and almost imperishable stakes for the support of Lilies and such-like things requiring that kind of assistance to keep them erect. *J. S.*

**Cloth of Gold Double Primrose.**—I send you for the purpose of comparison flowers and leaves of this new double yellow Primrose, and the same of the old late double yellow variety. The former is represented by flowers obtained from plants had direct from Messrs. Carter & Co., the latter from plants obtained from Scotland and other places. I have no doubt but that Messrs. Carter & Co. sent out their Primrose in thorough good faith, believing it to be a new and distinct variety, and the Floral Committee shared the same opinion when they gave it a First-class Certificate of merit. I was one of several who doubted its distinctness at the time, and the result justifies our hesitation. *A Lover of Hardy Primulas.* [We can see little or no difference between the specimens sent. Eds.]

**Figs for Town Planting.**—No one acquainted with gardening who happens to pass through either of our thickly-populated cities or towns, can fail to notice the wretched appearance of many of the trees and shrubs there planted, and to feel sorry for them in their forlorn condition, dragging out, as it must be admitted the majority of them do, a miserable existence—a state of vegetation which, as before remarked, produces aught but pleasant feelings in any observer. This unsatisfactory state of town trees arises in a great measure from planting the wrong kinds, which, owing to their thin woolly leaves, suffer much from the impurities of the atmosphere, as they not only gather and hold the dust and dirt in a way that stops all the breathing-pores, but the tender tissues are destroyed; and as the foliage has to be renewed again and again, the plants can only just live—making progress, therefore, is quite out of the question. I have seen Limes and Horse Chestnuts look as if they had been subjected to fire and almost defoliated at a time when they ought to be at their best and full of verdure, thus showing unmistakably how unsuitable they are, and yet, strange to say, they are the sorts that are generally selected. It is not my intention now, however,

to condemn any particular kind, or to do more than point out how adapted the Fig is for the work, as it is not only a plant of bold type and character, most striking to look at, but it stands well and holds its leaves till very late in the autumn. It need hardly be remarked that the Fig will not do for shrub planting, but for forecourt gardens and enclosed areas of that kind its habit renders it specially suitable, as it is dwarf and bushy—or it may be made so, by stopping the ends of the shoots or using the knife; and an additional recommendation is, that it will grow and thrive in almost any kind of loose, hungry soil that would be starvation to most other plants. In cities and towns builders have a way of burying the mortar rubbish, brick chips, and other *débris*, which form the staple of most gardens, and in these the roots of Figs are at home, and it is just the stuff to build up hard wood and bring about fertility, as the shoots they make under such régime are short-jointed with a fruit at every bud. In a general way the planting of deciduous trees or shrubs should be carried out in the autumn; but the Fig may be transplanted with safety quite as late as this, as plants of it always lift with plenty of fibres, and as the branches are so full of sap at this time of year, they retain their plumpness till the roots get to work. Removed in the autumn or winter they frequently suffer much from the frost, and have all the vitality dried out of them long before the weather is sufficiently warm to give them a start. The best way, however, just now, is to obtain plants in pots, as these are certain to live, as they may be turned out into the positions assigned with the balls of earth entire, which will save them from feeling a check. *J. Sheppard.*

**Robin Redbreasts' Nests.**—Summerhill Redbreasts are not alone in providing a snug place for their young. A similar case happened during the summer of 1878 at Kilmaron Castle, Cupar Fife. A redbreast built her nest in a plant of *Gymnogramma tartarea*, but our garden cat watched it very carefully, and at length plundered it. Little robin, nothing daunted, built a second time in a different plant in the stove, and successfully reared her brood. *D. R., Wigtonshire.*

— Strange places have been chosen for nesting-houses by birds and animals—hats and bonnets we have heard of, queer corners of buildings, and odd corners of fields and wood-stacks, but never till now did we hear of a teapot as the chosen place for a bird's nest. Robins are proverbially bold, but everyone encourages his boldness, for grouped round the little creature are legends of interest which begin with the old, old nursery rhymes of our childhood. The robin is not only bold but rather given to domesticity, as our readers will admit when told that one of these little winged creatures has made its nest in a teapot not 2 feet from the fireplace in a room of Mr. Burnett's house at Forton (about 2 miles from Chard), and not only made its nest, but deposited six eggs therein. How or when it approached its strange nest no one seems to have known. No one can deny the robin's boldness and courage after such a fact. In the south-east of Ireland the peasants believe that if a robin enters a house it is a sign of severe, unseasonable weather; what they would suppose to be prognosticated by a robin's making its nest in a teapot not far from a fireplace we cannot pretend to say. *Chard and Ilminster News.*

**Caladium argyrites.**—Most people acquainted with gardening matters will admit the necessity of hardening off stove plants when intended for use out of those structures, but what readers of the *Gardeners' Chronicle* would probably like to be informed on is how to harden *Caladium argyrites* sufficiently to render it capable of standing in winter with scarlet *Pelargonium* in the way advised by Mr. Hinds, for, as is well known, if subjected to the air of a room after November, or to a degree of heat and an atmosphere different to that of an ordinary hothouse, it would be down in a few hours. *J. S.*

**Autumn Strawberries.**—At p. 599 of the *Gardeners' Chronicle* of May 8 your correspondent, Mr. F. Williams, has expressed grave doubts respecting some remarks of mine upon the subject of "Autumn Strawberry Growing" in a previous number of the *Gardeners' Chronicle*. The tone of Mr. Williams' remarks is both friendly and reasonable, and he evidently writes from conviction; but his logic is not by any means sound, and his arguments are manifestly based upon hypothesis. Mr. Williams thinks the practice of planting out forced Strawberry plants for fruiting the year after being planted an excellent one, but he doubts if plants that are allowed to fruit in the autumn would be worth much the following year. In other words Mr. Williams thinks that to obtain crops in such rapid succession would be like burning the candle at both ends. Well, if facts are worth anything, I can assure your correspondent the case is different. Now for the proof. When forced plants are planted out the nature of the circumscribed conditions under which they have been grown causes

them to root vigorously into the fresh soil, and the crop they yield in the autumn has never, in my experience, interfered with their fruiting the following year unless the plants were lifted and reotted for winter forcing, in which case it is not worth while to plant them out a second time. Mr. Williams talks of the "little vitality" left in forced plants, while as a "matter of fact" they grow into large clumps in a short period after they are planted out when once their roots are not closely restricted. Again, it is erroneously assumed that the fruits would be small on account of the roots not having sufficiently established themselves in the soil to support a crop, but this is obviated by planting the plants out in proper time, say from the middle of April to the beginning of June, according to the season the plants are required to come into bearing. Mr. Williams further thinks that success in autumn Strawberry growing would very much depend upon a nice open dry time, which is cheerfully admitted; but are not the same remarks applicable to the spring months, which are often more unfavourable to Strawberry crops than the autumn months, which of late years have been bracing and fine, while as regards the ravages of birds I should think a net would be as efficacious in protecting the fruits in September or October as in the months of June and July. *W. Hinds.*

**New Zealand Spinach.**—Those who have anything to do with growing vegetables know how difficult it is to keep up a supply of Spinach during the summer and early autumn months, as, sow it where one may, the position always seems too hot and dry for it, and the result is, it bolts up to seed without forming leaves enough to afford a good picking. This, when cooks are demanding it almost daily, is very trying, but in the New Zealand kind we most fortunately have a very good substitute, for although perhaps not quite so good in quality, it answers every purpose, and may be grown in quantity with the certainty of being able to obtain a dish whenever required. All that is necessary to get it early is to sow in small pots, putting about three seeds in each, which soon germinate in gentle heat, and when the plants are up and are becoming strong, they may be hardened off and then planted out. If this is done on an old spent dung bed, or heap of decomposing weeds and rubbish, or in a trench where the same has been buried, they soon spread and grow with surprising vigour, the stems and leaves under such circumstances being much more succulent and tender than they are when the roots have only the common garden soil to feed on. Being fond of warmth, a sunny position where there is plenty of shelter will be found to suit this Spinach best, and if well watered once or twice in dry weather, that will improve it greatly and check the tendency to flower and seed. As the first sharp frost kills it, a sowing of the winter kind should be made towards the end of July to succeed it when destroyed, as got in later the plants are not strong enough in time to be robbed of their leaves. I have always found that for Spinach intended to stand till the spring, soot is the best dressing for the ground, which if spread over the surface somewhat thickly before digging, rids the soil of grub and wireworm that prey so much on the roots of the plants as frequently to spoil a whole bed. Manure, especially if not well decomposed, simply harbours these pests, but soot, if not fatal to them, is so obnoxious as to keep them at bay, and besides this it is one of the most valuable stimulants that can be used, as may readily be seen in the effect it has on all crops. *J. S.*

**Crimson Primroses.**—The interesting note of "M. J. B.'s" in your last number as to a popular idea of the origin of coloured Cowslips calls the following to my mind:—A few weeks ago I was in the brickyard at Hoxne, in Suffolk, where the stone instruments were found by Mr. Frere at the end of the last century. Very near this yard or pit I observed a cottage garden full of beautiful crimson Primroses. As the old lady (more than eighty years of age) was in the garden attending to her flowers I asked her where she procured her beautiful Primroses. She said she had gathered them herself in the woods and hedgerows, always looking after the white varieties. The white variety, she said, would speedily change to crimson when cultivated in a garden, whilst the yellow variety either would not change at all or would be very slow in changing. In most instances, she said, the yellow Primrose would never change, but the crimson plants I saw were all a few years back pure white. *W. G. S.*

## Obituary.

We regret to record the death, on the 11th inst., at Chatsworth, of the wife of Mr. THOMAS SPEED, after a brief illness. The many personal friends of Mr. Speed, and those who have called to see Chatsworth during the last twelve years, will, we are sure, be grieved to hear of his misfortune.

## Reports of Societies.

**Manchester Royal Botanical and Horticultural: May 14—21.**—The Grand National Horticultural Exhibition of this Society was opened on the 14th inst. and closed yesterday, having in the meantime afforded a memorable floral treat to thousands upon thousands of the Whit-week holiday makers of Manchester and its environs. The early incidence of Whitsun season and the cold weather of the past few weeks were circumstances antagonistic enough to give rise to some apprehension lest there might be a falling off in the supply of materials to make up a grand exhibition, but no falling off was apparent. Indeed we question if there has ever been a fuller or better furnished show, though the proportions of some of its elements were changed, as they necessarily are, by the seasonal peculiarities of each recurring year. In Orchids, which before all things might have been supposed to be too delicate to face the bitter north-east winds which prevailed, the display was fully equal to that usually brought together, and which is no doubt the finest to be seen in this country. Stove and greenhouse plants, if not quite up to the standard of those shown a few years since by Mr. Shuttleworth and Mr. Pilgrim, now both retired, were exceedingly well represented by the collections of Messrs. Tudgey, Cypher, and others. Large pot Roses were wanting, neither of the Rose champions being prepared to bring them so long a journey, but their place was well supplied by a grand lot of Clematises from Messrs. G. Jackson & Son and Mr. R. Smith, and which, as having never previously been seen in Manchester in such perfect condition and in such abundance, were perhaps fairly to be regarded as the chief attraction—the sensation of the show, as the *Manchester Guardian* puts it. Another most attractive feature consisted of the groups of Fancy Pansies and Violas which were largely shown and most effective, strong even well-furnished plants in 8-inch pots, bearing from a dozen to a score of flowers, the bold rich spotting and quaint colours of which in the case of the fancy Pansies, and the soft hues of the Violas, producing a very charming effect. Indeed we look upon the Orchids, the Clematis, and the Pansies as the most telling elements of the show. The attendance was very large, owing to the fine dry weather, the number of visitors up to Wednesday evening having been as follows:—Friday, 5000; Saturday, 6000; Monday, 17,000; Tuesday, 7000; Wednesday, 7500.

### ORCHIDS.

The classes provided for amateur competition were for fifteen, nine, and six plants, and one plant respectively, those for nurserymen being for collections of sixteen and ten. The premier amateur prize for fifteen goes this year to G. Hardy, Esq., of Timperley (Mr. Hill, gr.), who now wins his spurs, the present being the first occasion on which he has adventured the trying number of fifteen. It was a grand lot of plants which procured him this position. There were four fine *Cattleyas*, C. Mossie with twenty-one flowers, C. Mossie aurea with eighteen, C. Mossie marmorata with twelve, and C. Mendellii with ten blossoms—all clean, bright, and fresh-looking. *Masdevallias* were also finely shown, there being of M. Harryana, M. Veitchiana, and M. Lindenii respectively, strong tufts with from three to four dozen flowers on each; a fine mass of *Ada aurantiaca*; *Dendrobium densiflorum*, with sixteen racemes of its showy yellow flowers; *Saccolabium ampullaceum*; *Odontoglossum cirrosum*, good, and a pan 18 inches across of *Odontoglossum Cervantesii* smothered with blossoms. The 2d prize fell to R. B. Dodgson, Esq., Blackburn (Mr. Osman, gr.), who had a large healthy *Vanda insignis* with five flower-spikes; a fine *Oncidium Marshallianum*, which was shown well in several other collections, and was very attractive from its large bright yellow blossoms; *Dendrobium densiflorum*, with fully three dozen racemes; *Cypripedium Stonei*, with four flowering stems, and dense masses of C. *villosum* and C. *barbatum*; well-bloomed specimens of *Odontoglossum vexillarium*, of O. *triumphans*, and of O. *cirrosum*; *Masdevallia Harryana* cœrulea, and *Dendrobium Schroderi*. W. Leech, Esq., Fallowfield (Mr. Swan, gr.), was 3d, with an *Aerides Fieldingii*, with five spikes; *Dendrobium Falconeri*, well flowered; *Dendrobium densiflorum* and D. *thyrsiflorum*, each with about a dozen spikes; *Odontoglossum cirrosum* with seven flower-spikes; a good *Masdevallia Veitchiana*, *Phalenopsis Lüdemanniana* full of blossoms, *Cypripedium Stonei* with four flower-stems, a large pan of C. *spectabile*, and C. *caudatum superbum* with about a dozen fine flowers; *Cattleya Mendellii* with four bloom-spikes; a pretty small *Odontoglossum vexillarium* with four flowering stems, and a good spike of *Odontoglossum Andersonianum*.

The 1st prize in the class for nine was taken by F. Yates, Esq., Blackburn (Mr. Thompson, gr.), who showed a capital lot of plants, although several of the "specimens" consisted of square shallow boxes filled up by a number of absolutely distinct plants—a system which rather suggests a long pocket than high-class cultivation. The collection consisted of *Masdevallia Lindenii*, and M. *Harryana*, with over a dozen plants in each box plunged distinctly apart, like the plants in a flower-bed; *Odontoglossum cirrosum*; O. *vexillarium*, a made-up mass, with numerous flowering stems; *Dendrobium pulchellum*, a very beautiful little basket specimen; *Cattleya citrina*, *Oncidium Marshallianum*, with three fine spikes; a grand *Dendrobium Wardianum*, with upwards of a dozen good flowering stems; and D.

thyriflorum, with five good spikes. Dr. Ainsworth, Broughton (Mr. Mitchell, gr.), was placed 2d. He had a fine specimen of *Vanda suavis*, with seven spikes; *Aerides affine*, with four very fine branching spikes; *Calanthe vestita*, with about a dozen expanded spikes; a beautiful form of *Odontoglossum Pescatorei*, with *O. crispum*, *citrosimum*, and *vexillarium*; *Phalenopsis Lueddemanniana* and the brilliant orange *Epidendrum vitellinum majus*. W. Leech, Esq., was 3d with a nice lot of plants, in which a good *Dendrobium densiflorum*, *D. Devonianum*, beautifully flowered; *Odontoglossum Hallii xanthoglossum*, and *O. triumphans* were the most conspicuous examples.

In the smaller class of six, Joseph Broome, Esq., Didsbury (Mr. A. Williams, gr.), was 1st, with neat, well-flowered, small plants of the following species:—*Dendrobium crepidatum* and *D. thyriflorum*; *Cypripedium villosum* and *C. barbatum*; *Laelia purpurata* and *Cattleya lobata*. The 2d prize went to W. Turner, Esq., Winsford (Mr. Bolt, gr.), who showed *Laelia Williamsii* and *purpurata*, *Vanda suavis*, *Cattleya Mendelii*, *Cypripedium Crossianum*, and *Odontoglossum Roezlii*. The 3d prize was awarded to J. Heywood, Esq., Stretford (Mr. Elphinstone, gr.), in whose group was a fine *Dendrobium Dalhousianum*, with about a dozen of its lateral spikes of nankin-coloured showy blossoms. The single specimens were not very remarkable. R. B. Dodgson, Esq., was 1st with a small *Odontoglossum vexillarium*; W. Leech, Esq., 2d, with a fine *Dendrobium thyriflorum*, bearing fifteen of its drooping trusses of butter-and-egg-coloured flowers. J. Fildes, Esq., was 3d.

The nurserymen's contingent was unusually strong, Mr. Williams showing with his accustomed spirit, and a formidable rival turning up in the person of Mr. James, Castle Nursery, Lower Norwood, who entered in both the classes, and, moreover, showed well. For sixteen, Mr. B. S. Williams, Holloway, was 1st with a grand bank, which included a dense mass of *Epidendrum vitellinum majus*, with nearly fifty flower-spikes; *Bollea caelestis*, with six flowers; *Laelia purpurata*, with three grand spikes; *Masdevallia Veitchiana*, with eighteen flowers; *Cattleya Mendelii*, with eight flowers; *Masdevallia ignea aurantiaca*, with thirty flowers; *Cypripedium Stonei*, with two good spikes; *Cattleya Warneri*, with nine flowers; and *Oncidium macranthum hastiferum*, a fine specimen, with its curious brown-tinted sepals and bright yellow petals. Mr. H. James, Lower Norwood, was 2d, with a very showy group, including a fine *Odontoglossum cirrosium*, with about twenty flower-spikes; a good *Dendrobium Wardianum*, with about six stems; a very showy plant of *Oncidium Marshallianum*, with its large bright yellow inflorescence; *Odontoglossum Roezlii* and *Roezlii album*, each with about a dozen flowers; *Odontoglossum vexillarium*, with four spikes of very large flowers; a large mass of *Cypripedium villosum*, and of the somewhat similar *C. Boxallii*; a good *C. barbatum*, and *Dendrobium chrysotoxum*, with five blooming spikes. Mr. Cypher, Cheltenham, was 3d; his collection, consisting of small plants, amongst which was a nice plant of *Dendrobium lituiflorum*, and another of *Cypripedium Stonei*.

In the next class of ten plants Mr. B. S. Williams was again 1st, with a group consisting wholly of good well-bloomed plants. It consisted of *Cattleya Mossie superba*, with fourteen flowers; *Cypripedium Boxallii*, and *C. barbatum superbum*; *Epidendrum vitellinum majus*, as large as in the preceding class; *Vanda tricolor*, *Dendrobium suavisimum*, with seven flowers; *Masdevallia Lindenii*, with thirty flowers; *Laelia purpurata*, with four good spikes; and *Odontoglossum Alexandrae*. Mr. James was 2d, his plants being all good specimens and well-flowered; amongst them were *Dendrobium nobile*, *D. Wardianum*; *Oncidium Marshallianum*, with four, and *O. concolor*, with fifteen flowering stems; *Oncidium crispum*, with five spikes; *Odontoglossum crispum* with seven spikes, *O. citrosimum roseum* with six, and *O. vexillarium* with eight spikes; a fine mass of *Cypripedium barbatum superbum*, and a *Cattleya Mossie* with fourteen flowers. Mr. Cypher came in 3d, and had a beautiful little plant of *Vanda coerulescens*, with eight spikes of its small but lovely bluish flowers; *Epidendrum vitellinum*, rich orange; and the following *Odontoglossum*, *citrosimum*, *Bluntii*, *Hallii*, and *luteo-purpureum*.

#### CLEMATIS.

The class was for thirty specimens, and there were two competitors, so that these alone made a fine display. The 1st prize went to Messrs. G. Jackman & Son, Woking, the 2d to Mr. R. Smith, Worcester. Mr. Jackman's plants averaged about 3 feet high, of globular outline, and were well furnished with foliage and flowers on every part. They were mostly of the patens group, and included all the best varieties of that type, namely, *Sir Garnet Woseley*, *Lord Derby*, *Stella Vesta*, *Maiden's Blush*, *Fair Rosamond*, *Mrs. S. C. Baker*, *Lady Lonsborough* and *Miss Butenry*, with a few of early-blooming hybrid lanuginosae such as the *Queen*, *Princess of Wales*, and *Robert Hanbury*. Mr. Smith's plants were on the whole larger, being trained in a more pyramidal form, and several of them 4 feet high; they were varieties of *lanuginosa*, and at first sight, from the large size of their flowers, seemed to have the advantage over the Woking plants, but a closer inspection showed them to be all faced or one-sided plants, and though some of them were very good the group of thirty contained about one-third of quite inferior specimens. We remember when "faced" Indian *Azaleas* used to be shown at Manchester, but a low position on the prize list on one occasion when this defect was very pronounced, did away with half-furnished *Azaleas* at Manchester shows; and the hint must be taken in the case of Clematises. The best of the Worcester plants, as we have said, were very attractive, and included *Anderson-Henry* and *Madame Van Houtte*, very large whites; *Marie Lefebvre*, in the way of *Lady C. Nevill*; *Fairy Queen*, white with red bars; *Sensation*, Mrs.

Bush, and *Gem*, shades of mauve; *Lord Napier*, mauve-purple—these all being lanuginosae; and *Mrs. Quilter*, a white patens with purple stamens. Most of these were showy plants, as also was *purpurea elegans*, a large bluish-purple—one of the best plants shown. By choosing late-flowered sorts Mr. Smith had necessarily been compelled to push them on in heat, and they showed unmistakable evidence of the enforced haste; while the fact that Mr. Jackman's sorts were those of the natural season permitted him to bring them out with that exquisite finish and symmetry of growth and bloom which eventually carried the day and placed him in the 1st position on the prize list. This is a point that might be well considered in the schedule another year—we mean that the type of Clematis invited might very well be regulated by the early or late incidence of the date of the show, which would be better than leaving it an open question, and thus allowing subjects of distinct character to come into close competition.

Besides the thirty competing plants Messrs. Jackman showed an additional seventy plants, making up such a group of the hardy spring-flowered Clematises as had never been seen previously in Manchester. For these a special award was made.

#### STOVE AND GREENHOUSE PLANTS.

The principal class in this section of the show was for twenty plants, ten in flower and ten foliage. The 1st prize was nobly won by J. F. G. Williams, Esq., Henwick Grange, Hallow (Mr. Tudgey, gr.), who staged a group of grand plants which had been in every way skilfully handled, though less bulky than some we have seen occupying the same position. The flowering plants, which were in robust health and profuse bloom, included *Erica ventricosa magnifica*, *E. ventricosa coccinea minor*, *E. Cavendishiana*, and *E. tricolor* Wilsoni, and *Aphelaxis macrantha purpurea*. Amongst the foliage plants were a large *Cycas circinalis*, *Pritchardia pacifica*, *Cycas revoluta*, a big *Latania borbonica*, *Cocos Weddelliana*, a small but fresh looking *Cordyline indivisa* whose beautiful orange-ribbed leaves are very effective, and a well coloured *Croton pictus*, which stands well even now amongst the numerous novelties of late years. The 2d prize fell to J. Rylands, Esq., Stretford (Mr. G. Smith, gr.), who had a good *Azalea Roi Leopold*, a small but well flowered *Erica profusa*, *Clerodendron Balfourianum*, *Darwinia Hookerii*, *Bougainvillea glabra*, a good mass of *Alcoccasia*, *Lowii*, in fine health, the whole backed up with large Palms and well coloured Crotons. The 3d prize went to H. Samson, Esq., Bowdon (Mr. Lingard, gr.), in whose group was an immense *Gleichenia Spelunca*, a good *Stauca profusa*, and two well-flowered plants of *Aphelaxis*. In a group shown by Sir Wilfred Lawson (Mr. Hammond, gr.), were two grand Crotons, and a remarkably fine *Maranta Veitchii*.

The class for eight plants brought out some specimens of remarkable excellence from J. F. G. Williams, Esq. (Mr. Tudgey, gr.), all being models of high cultivation, free in growth, and with a profusion of flowers. They consisted of *Erica Victoria*, *Aphelaxis macrantha rosea*, *Erica Cavendishiana*, and a splendid *Erica elegans*, forming the front line, backed by a large *Pimelea decussata*, *Clerodendron Balfourianum*, and two fairly good Indian *Azaleas*. S. Schloss, Esq., Bowdon (Mr. Beddoes, gr.), was 2d, his collection containing an *Incanophyllum miniatum splendens*, with about a score of its umbels of showy flame-coloured blossoms; a fine *Anthurium Scherzerianum*; a well-coloured *Darwinia tulipifera*; and a grand *Acrophyllum venosum*, 4 feet across, full of flower.

The nurserymen's class for twenty plants, ten in flower and ten foliage, was well filled. Mr. J. Cypher, Cheltenham, was well 1st with a remarkably fine lot of plants, not only well grown and well flowered, but well brought out and judiciously set up, so as to be specially effective. Amongst them were some of the best specimens in the show. Here were *Darwinia tulipifera*, 4 feet by 3 feet, superbly flowered and brilliantly coloured; a large *Erica Cavendishiana*, *Clerodendron Balfourianum*, on a globular trellis 5 feet by 4 feet, which was completely covered with flowers; a small *Erica Victoria*, richly flowered; a grand *Anthurium Scherzerianum*, with thirty-six of its crimson spathes; *Bougainvillea glabra*, a capital moderate-sized *Acrophyllum venosum*, 3 feet by 2 feet; and a neat and well-bloomed *Erica depressa*. These had a background consisting of a grand lot of foliage plants, comprising two very large and fine Crotons, an immense *Gleichenia flabellata*, in perfect health; a dense specimen of the variegated *Phoridium*, and the very elegant *Cycas intermedia*. The 2d prize was won by Mrs. E. Cole & Sons, Withington—a fine lot of plants, some of which had suffered from too sudden exposure. The group contained four good Indian *Azaleas*, *Ixora Fraseri*, 4 feet by 3 feet, well bloomed; *Croton Victoria*, a grand bushy specimen; a large *Erica Distraeli*, in splendid bloom; and a fair *Anthurium Scherzerianum*, the whole backed up by large Palms, &c.

For eight Foliage Plants the 1st prize went to R. B. Dodgson, Esq., who showed a massive *Anthurium crystallinum*, a very effective specimen; a large *Gleichenia rupestris*; and a fine example of *Cycas revoluta*. The 2d prize lot, from T. H. Birley, Esq., Pendleton (Mr. Elkin, gr.), contained a capitally-grown large plant of *Cordyline indivisa*; *Cibotium regale*, large and feathery; *Croton Weismanni*, rather deficient in colour; a large *Phoridium tenax variegatum*, *Cocos Weddelliana*, and a large *Latania borbonica*.

**Greenhouse Ericas.**—The 1st prize in the amateurs' division for six was awarded to J. F. G. Williams, Esq., for a set of neat, moderate-sized plants, amongst which were good examples of *E. depressa*, *mutabilis*, *ventricosa magnifica*, and *mirabilis*, the lovely pink flowers of which recall those of the equally lovely *Daphne Nucorum*,

The 1st prize in the nurserymen's group of eight fell to Mr. Cypher, who had in his group beautiful examples of the yellow-flowered *E. depressa*, 3 feet by 2 feet; another yellow-flowered sort, *E. affinis*, 2 feet by 3 feet; and *E. Victoria*, which is one of the best of the *retorta* set, 4 feet by 4 feet. The 2d prize was given to Mrs. E. Cole & Sons, in whose group was a good *E. Cavendishiana*, and a pretty plant, 3 feet by 2 feet, of the seldom-seen *E. Spenceriana*, a soft-wooded Heath, with purplish-lilac tubular flowers of considerable beauty.

**Greenhouse Azaleas.**—These were very indifferently represented on the amateur side. The nurserymen showed better, Mrs. Cole & Sons being 1st in the class for ten with a fairly good group, in which figured the old and still effective *Stanleyana*, *Stella*, *Roi de Holland*, *Duc de Nassau*, and *Duchesse Adelaide de Nassau*, all nicely bloomed. Mr. Cypher came in 2d.

**Crotons.**—In the class for eight Mr. B. S. Williams, the only competitor, was placed 1st for a group of well-grown plants, consisting of *C. Burtoni* of the *Veitchii* type, *C. Williamsii*, *C. Wilsoni*, *C. Henryanus* of the *Andreanus* type; *C. Truffautii*, the base-central part of the leaf yellow; *C. Disraeli*, and *C. Evansianus*, one of the sub-lobate series. In the class for six Sir W. Lawson was 1st; S. Schloss, Esq., 2d; and J. Rylands, Esq., 3d.

**Dracaenas.**—For ten Mr. B. S. Williams was 1st. For six the prizes went to J. Duffield, Esq., 1st; R. B. Dodgson, Esq., 2d; and Sir W. Lawson, 3d. The plants were neat and of moderate size, and were mostly utilised to form a dividing line down the central table in the tent devoted to the various fruits, to Pansies and herbaceous plants, &c.

**Palms.**—In the class for four J. Broome, Esq., was 1st, with a pretty *Geonoma gracilis*, 5 feet high, and larger plants of *Kentia rubricaulis*, *Livistonia altissima*, and *Thrinax elegans*. J. F. G. Williams, Esq., was 2d, with *Kentia australis*, *Geonoma princeps*, *Chamaerops stauracantha*, and *Cocos Weddelliana*. Lord Howard, Glossop (Mr. Irvine, gr.), was 3d, and had in his group a tall and elegant plant of *Cocos filifera*. Mrs. E. Cole & Sons had a 1st prize for a pair of greenhouse Palms.

**Yuccas.**—A class was provided for two pairs of Yuccas, and brought several interesting exhibits. The 1st prize fell to S. Schloss, Esq., who exhibited a pair of *aloifolia variegata* 8 feet high, and two fine *filamentosa variegata*. J. Broome, Esq., was 2d, with a pair of *aloifolia variegata* and a pair of *quadricolor*, respectively 4 to 5 feet high. D. McClure, Esq., Heaton Mersey (Mr. Rose, gr.), was 3d, with smaller but even sized pairs of *filamentosa variegata* and *aloifolia variegata*.

**Pitcher Plants.**—Prizes were offered for the best collection of *Sarracenia*, *Nepenthes*, &c., the 1st of which was awarded to J. Broome, Esq., who had a large and well-grown group, consisting mostly of *Nepenthes*. J. Fildes, Esq., Chorlton-cum-Hardy (Mr. Bruce, gr.), was 2d, with a group containing several *Sarracenia* and *Drosera*. One, called *Sarracenia Fildesii*, is of large growth, much larger than *flava*, the lid of the pitcher broadly cordate, with a mucronate tip, and marked on the neck by a few prominent red veins.

#### FERNS.

For eight *Stove and Greenhouse Ferns* S. Schloss, Esq., was 1st with a very finely-grown lot, including *Davallia tenuifolia*, at least 6 feet through; good fresh-looking plants of *Gleichenia Spelunca*, *G. dichotoma*, and *Mendelii*, of very large size; *Davallia Mooreana*, an immense dense bush 8 feet through; and a charming bit of *Brainea insignis*, remarkable for its vigour of growth, and showing off to advantage its chocolate-red young fronds. H. Samson, Esq., was 2d. He had four *Gleichenias* from 5 feet to 8 feet across, finely grown, consisting of *G. dichotoma*, *G. flabellata*, *G. rupestris*, and *G. Mendelii*; a small neat *Brainea insignis*, *Davallia Mooreana*, *Cyathea medullaris*, and *Dicksonia antarctica*. J. F. G. Williams, Esq., was 3d, the most remarkable plant in his group being a fine *Cibotium regale*, with a spread of fronds of 10 to 12 feet; a well-furnished *Microlepia hirta cristata*, and a fine *Cheilanthes elegans* in this collection had been injured in transit, or it would probably have stood higher on the prize list.

**Hardy Ferns.**—In the amateurs' class of twelve, W. Brockbank, Esq., Didsbury (Mr. Morris, gr.), was 1st with a fine lot, including *Osmunda regalis* and *regalis cristata*, *Osmunda spectabilis*, *cinnamomea*, and *Claytoniana*, a grand *Adiantum pedatum*, and fine stoups of *Lactrea Filix-mas cristata*, and *L. Filix-mas Barnesii*, dense masses, 3 feet high by 3 feet through. A. Birley, Esq., Pendlebury (Mr. Hesketh, gr.), was 2d, and showed several fine examples of the varieties of *Lady Fern*, *Athyrium Filix-femina todeoides* being especially good. G. Hodgkinson, Esq., Dunham Massey (Mr. Boardman, gr.), was 3d; in his group of good even plants was a fine fresh *Oncoclea sensibilis*. In the nurserymen's division, also for twelve, the 1st prize was given to Mr. C. Ryland, Aughton, who amongst others of a well-grown group showed noteworthy examples of *Athyrium Filix-femina Elworthii*, *tortile*, *plumosum*, and *Crugii*, and a grand plant of *Lactrea Filix-mas cristata*.

**Adiantums.**—A special class was provided for a group of six, and was filled to overflowing. The 1st prize was awarded to G. Hodgkinson, Esq., Dunham Massey, who had large plants of *A. formosum*, *concinnum*, *cuneatum*, *graecillum*, *assimile* and *fulvifolium*, not only large but clean and fresh. R. B. Dodgson, Esq., was 2d, also with large plants of *A. tenerum*, *formosum*, *graecillum*, *fulvifolium*, *cuneatum*, and *curvatum*. J. F. G. Williams, Esq., who was 3d, showed a nice plant of *A. macrophyllum*.

#### NEW PLANTS.

Of these nurserymen were required to show twelve and amateurs six. The 1st and only prize for the former went to Mr. B. S. Williams, who had an interesting group, consisting of *Croton Wilsoni*, with leaves 1 foot

long and 1 inch broad, with yellow rib and blotches; *Croton Warrenii*, with long, narrow, drooping leaves, both undulated and twisted, freely blotched with yellow soon passing to red; *Dracena superba*, a narrow leaved red-edged kind; *Dracena Goldiana*, now pretty well known, one of the best of the genus; *Kentia Wendlandii*, *Microlepia hirta cristata*, *Cocos elegantissima*, *Anthurium Waroquianum*, with elongate cordate leaves of velvety green with white ribs; *Katakidozamia Hopei*, a Cycad, with pinnate glossy leaves of rather a bold character; *Encephalartos Frederici-Guilielmi*, *Cupania elegantissima*, with large shining pinnate leaves; *Dieffenbachia antioquiensis*, a desirable species, of neat habit, with erect leaves, oblong acuminate in form, having white rib, and a dark green surface freely blotched with yellowish green patches. In the amateurs' class R. B. Dodgson, Esq., was placed 1st, with large plants of *Croton Queen Victoria*, *C. Disraeli* and *Microlepia hirta cristata*; a good example of *Anthurium Waroquianum*, *Dracena superba*, and *Lomaria discolor bipinnatifida*. Sir W. Lawson was 2d, with smaller plants of *Croton Evansianus*, *Lomaria discolor bipinnatifida*, *Kentia Macarthurii*, *Croton nobilis*, and *Anthurium Veitchii* and *A. Waroquianum*. The 3d prize went to J. F. G. Williams, Esq.

#### FLORISTS' FLOWERS.

**Roses.**—Few Roses were shown, but these popular flowers were represented by a group of twenty in 9-inch pots, shown by Messrs. Paul & Son, of Cheshunt, to whom the 1st prize was awarded. They were nice well-flowered dwarf plants, and amongst them were noted specially interesting examples of the white *Madame Lacharme*, the blush *La France*, and the yellow *Céline Forestier*. One or two sets better than usual came from private gardens, but somehow or other pot Roses from private gardens seldom take a very high position.

**Pelargoniums.**—Mr. C. Rylance was 1st for a group of eight, amongst which *Wellington* and *Vesuvius*, scarlets, and Mrs. Leavers and *Softness*, pinks, were most attractive. In the amateurs' class for six, W. J. Legh, Esq., Disley (Mr. Cooper, gr.), was 1st with a set containing good examples of *New Life* and *Samuel Plimsoll*. In the class for Show *Pelargoniums* Mr. C. Rylance was 1st, showing in his group *Kingston Beauty*, one of the market breed, with densely clustered flowers, white, with small rosy spots on all the petals but smallest in the three lower ones. The same grower had the 1st prize for six *Fancy* varieties.

**Pansies.**—For six in 8-inch pots, J. G. Adams, Ashton-on-Mersey (Mr. Beard, gr.), was 1st; W. Joynton, Esq., Sale (Mr. Critchley, gr.), 2d; and E. Coward, Esq. (Mr. Johnstone, gr.), 3d. For twenty in 8-inch pots, a nurseryman's class, Mr. H. Hooper was 1st. For six *Fancy* in the same size pots, W. Brockbank, Esq., was 1st, J. G. Adams 2d, and W. Joynton, Esq., 3d. In the nurserymen's class for six *Fancy*, equal 1st prizes were awarded to Mr. S. Robinson and Mr. W. Brownhill, Sale; and the 3d to Mr. Hooper, Bath. These, as we have already stated, formed a very striking exhibition.

**Violas.**—For six in 8-inch pots, A. Lumbers, Esq., Heywood, was 1st; D. McClure, Esq., 2d; and J. G. Adams, 3d. For twenty in 8-inch pots, Mr. Hooper was 1st, Mr. S. Robinson 2d, and Mr. W. Brownhill 3d. Like the Pansies, these made a very interesting show.

#### HARDY EVERGREENS.

Hollies, Conifers, Rhododendrons, and other hardy plants, were shown in limited quantities, the Rhododendrons, with Ghent *Azaleas*, being useful as supplying some colour in the annexe. They were mostly sent by Messrs. J. Waterer & Sons, of Bagshot, who also exhibited a group of Japanese plants. In this department Mr. Jackman showed *Thuja orientalis densa glauca*, a compact obtusely conical hardy evergreen, with the spray very fine and dense, and when perfectly developed of a glaucous green colour.

**Hardy Perennials.**—Very interesting groups of these were shown by W. Brockbank, Esq., and by Mr. W. Brownhill, of Sale, both of whom gained 1st prizes in their respective classes. They were greatly admired, and contained many subjects of great beauty and interest. In Mr. Brockbank's group was a *Verbascum Malcombei*, with white flowers which we had not seen before; it was very much like a white form of *V. phoeniceum*.

#### FRUIT.

**Collections.**—Three collections of forced fruits were staged, and, as usual, were scrutinised by many longing eyes. They were all meritorious, the best, which was awarded the 1st prize, being sent from the garden of Joseph W. Pease, Esq., Hutton Hall, Guisborough (Mr. Melndoe, gr.), and contained good Black Hamburgs, Madresfield Court, and Early Saumur Muscat Grapes, the latter nicely ripened, and, though small, having a much better appearance on the exhibition table than the immature white Grapes so commonly seen at early shows; three sorts of Melons, Brown Turkey Figs, five sorts of Peaches—Hale's Early, very fine; Bellegarde, Rivers' Early York, Royal George, and Barrington; Lord Napier Nectarine, in capital condition; and good examples of the large-fruited James Veitch Strawberry and of the Vicomtesse Hélicart de Thury. The 2d prize was taken by Lord Carington, Wycombe Abbey (Mr. Miles, gr.), who had well-ripened Black Hamburg Grapes, unripe Muscats, Sir Joseph Paxton and President Strawberries, three Melons, fine Elton and a splendid dish of Black Circassian Cherries, two Pine-apples, and a grand dish of Brown Turkey Figs. Lord Hill, Hawkstone Park (Mr. Pratt, gr.), came in 3d. He showed Brown Turkey and Castle Kennedy Figs, President and Sir Harry Strawberries, Black Hamburg and Foster's Seedling Grapes, and two Melons.

**Grapes.**—The classes for both black and white Grapes,

two bunches, were well represented, the former being the more abundant of the two. Mrs. Ackers, Congleton (Mr. Bruce, gr.), was placed 1st for black, and showed good bunches of well finished Black Hamburgs, short and compact in form. The 2d prize went to J. W. Pease, Esq., who showed Madresfield Court in moderate sized bunches, well coloured, and with a beautiful bloom. The 3d prize was given to W. Blinkhorn, Esq., St. Helen's (Mr. Smith, gr.), who showed squat bunches with smallish berries of the universal favourite Black Hamburg. J. W. Pease, Esq., was 1st for whites, with neat bunches of well-ripened Early Saumur Grapes; Mrs. Ackers 2d for Duke of Buccleuch, with very fine berries, perfectly clear and spotless; and W. Blinkhorn, Esq., 3d, with unripe Muscats.

**Pine-apples** were small and not up to the average of merit. J. W. Pease, Esq., was 1st for two fruits with Prince Albert and Charlotte Rothschild. H. Bramwell, Esq., Worcester (Mr. Hilman, gr.), was 2d, with two small Black Jamaicas; and F. G. Sumner, Esq., Hayfield (Mr. McGaw, gr.), was 3d with two small Queens.

**Strawberries** were invited in groups of twelve pots, and some excellent examples of good cultivation were shown by the Earl of Ellesmere, Worsley (Mr. Uppohn, gr.), who was awarded the 1st prize; the 2d prize going to F. J. Sumner, Esq. Amongst extras in this department was a capital dish of Stamfordian Tomato, from the gardens at Hutton Hall, Guisborough, which were large, characteristic, and well-coloured, and had an appetising appearance.

#### MISCELLANEOUS.

Several mixed groups were staged, the most extensive being that of Mr. B. S. Williams, which included small plants of many new and interesting older plants. Amongst these we particularly noticed *Croton Hanburyanus*, with longish leaves 2 inches wide, the costa and adjacent parts yellow at the base of the leaf, but the colour not extending to the apex; *C. Chelsoni*, with narrow drooping leaves having a yellow costa, the foliage altogether fine and elegant, forming an exceedingly pretty plant; and *Pelargonium Maid of Kent*, one of the market sorts, with dense heads of white flowers having rose-coloured spots, small on the lower petals, and somewhat larger on the two upper ones. Messrs. Standish & Co., Ascot, had a fine and varied group of Japanese Maples, in which were two very fine specimens of the charming *Adiantum gracillimum*, and a quantity of small plants of the same all admirably grown and very characteristic. Messrs. Dickson & Robinson, Manchester, Messrs. G. & W. Yates, Manchester, and Messrs. F. & A. Dickson, Chester, had interesting groups of small nursery stock; Mr. B. S. Williams, a fine group of *Amaryllis*; and H. G. Adams, Esq., some well-bloomed plants of *Lilium auratum*.

#### CERTIFICATES.

The following Certificates were awarded:—To Mr. B. S. Williams for *Dieffenbachia antioquiensis*, for *Cupania elegantissima*, for *Croton Warreni*, for *Croton Evansianus*, for *Croton Chelsoni*, for *Croton Hanburyanus*, for *Katakidozamia Hopei*, for *Encephalartos Frederici-Guilielmi*, and for *Pelargonium Maid of Kent*.

**Royal Botanic: May 19.**—Though somewhat thin, the first summer show, held in the Society's incomparable exhibition ground on Wednesday, was as a whole quite up to the average, and as regards pot Roses and Orchids much superior to what has been seen at the May shows of late years. The Roses from Slough and Cheshunt were simply superb, but it was a Slough day *par excellence*, Mr. Turner taking the 1st prizes for nine and twenty plants respectively, and Messrs. Paul & Son the 2d in the former class. Mr. Turner's nine were not quite so evenly a matched lot as we have seen him show before, but there was no denying their superiority. Perhaps the most remarkable example amongst them was a specimen of the Tea *Madame de St. Joseph*, a perfect model of what a pot Rose should be, the plant being somewhat flatter than usually shown, from 5 to 6 feet through, well clothed with splendid foliage, and finished off with a beautifully balanced lot of blooms of rare quality. An immense bush of *Juno*, right to the day, stood next in point of merit, this being followed by a similar example of *La France*, perfection itself in foliage, and carrying a fair number of grand blooms. The familiar specimen of Charles Lawson was larger than ever, and in rare condition, while the examples of Edward Morren, Victor Verdier, Céline Forestier, and Paul Verdier, were all that could be desired. *Madame de St. Joseph* was also grandly shown by Messrs. Paul & Son, together with noble specimens of *Céline Forestier*, *Anna Alexieff*, *La France*, *Victor Verdier*, *Souvenir d'un Ami*, *Dupuy Jamin*, and *Dr. Andry*—the latter being a perfect picture of health and beauty, regularly, but not too stilly trained, and splendidly bloomed; Mr. Turner's twenty consisted of half specimens in 8 and 10-inch pots, well done in all respects. From Slough there also came a small group of new Roses, in which were notably fine blooms on plants of the Hon. G. Bancroft, Countess of Rosebery, *Madame Lambert*, *Duchess of Bedford*, *Madame Eugénie Verdier*, *Égeria*, *Gaston Leveque*, &c. To the miscellaneous class Messrs. James Veitch & Sons also contributed a large and strikingly effective group of half-specimen plants, tastefully blended with the richly-cut foliage of various Japanese Acers.

The Orchid bank was well furnished, and the plants added to the general display a very effective mass of diversely coloured and quaintly formed blossoms. In the amateurs' class for twelve the 1st prize was won by Mr. Heims, gr. to F. A. Philbrick, Esq., Q.C., Avenue Road, Regent's Park; the 2d by Mr. Ollerhead, gr. to Sir H. W. Peck, Bart., M.P., Wimbledon House; and the 3d by Mr. Douglas, gr. to J. Whitburn, Esq., Loxford Hall. Mr. Heims' best specimens were of *Thunia Marshalliana*, *Cattleya Mossiae* and its variety *superba*, *Odontoglossum cirrosium*, *Dendrobium thyrsiflorum*, *Masdevallia Harryana cœrulescens*, *Odontoglossum citrosinum roseum*, &c. A fine mass of *Odontoglossum vexillarium*, with eighteen spikes, with a fine pan of *Cypripedium barbatum*, and a good *Cattleya Mossiae* were the most striking examples in the Wimbledon House collection; while of the Loxford Hall plants a good *Odontoglossum vexillarium*, with seven spikes, a grand *Cattleya Mossiae superba*, and a large *Dendrobium nobile* were the leading features. In the corresponding class for nurserymen, Mr. B. S. Williams had no difficulty in securing the 1st prize with a capital group, which included excellent examples of *Cattleya Warnerii*, a lovely bit of colour; *Laelia purpurata*, *Cypripedium barbatum superbum*, *Odontoglossum Alexandre*, *Masdevallia Harryana splendens*, *M. Lindenii*, *Odontoglossum sceptrum*, *O. vexillarium*, and *Cattleya Mossiae*, Messrs. T. Jackson & Son, Kingston, were 2d.

Of stove and greenhouse flowering plants by far the best specimens came from Mr. Chapman, gr. to J. Spode, Esq., Hawkesyard Park, Rugby, who won the 1st prize easily in the amateurs' classes for ten and six respectively. In both of his groups Mr. Chapman staged large, well-furnished, and superbly flowered examples of *Tremandra ericifolia*, and in the group of ten his other most noticeable specimens were of *Acrophyllum venosum*, *Stactis profusa*, *Clerodendron Balfourianum*, *Erica Cavendishiana*, and *E. affine*, &c. *Dracophyllum gracile*, *Ixora coccinea*, *Azalea Mars*, and another large bush of *Erica Cavendishiana* were the most conspicuous objects in the group of six. Mr. Child, gr. to Mrs. Torr, Garbrand Hall, Ewell, was 2d for ten; and Mr. G. Wheeler, gr. to Lady Louisa Goldsmid, 3d for ten and six. In the nurseryman's class for twelve Messrs. T. Jackson & Son beat Messrs. B. Peed & Son, of Lower Streatham, for 1st honours, with fairly good plants of *Darwinia fuchoides*, *Imantophyllum miniatum*, *Erica ventricosa tinctoria rubra*, *E. Lindleyana*, *Pimelea Hendersonii*, &c.; and the best of the Messrs. Peed's plants were examples of *Dracophyllum gracile*, *Anthurium Scherzerianum*, *Erica eximia superba*, &c.

Fine-foilage plants were represented by the usual assortment of Palms, Crotons, &c., of various sizes, but which need not here be named. In the amateur's class the awards went to Mr. G. Wheeler, Mr. J. Douglas, and Mr. R. Butler, gr. to H. H. Gibbs, Esq., St. Dunstan's, Regent's Park; and in the trade class to Mr. B. S. Williams and Mr. J. W. Wimsitt, Asburnham Park Nursery, Chelsea, in the order named. Mr. B. S. Williams also secured the highest award in the nurserymen's class for six exotic Ferns, for large and telling specimens of the distinct *Alsophila australis Williamsii*, *Cyathea Burkeii* and *C. dealbata*, *Gleichenia flabellata*, *G. Mendelii*, and the very singular *Aglaomorpha Meyeniana*. Amongst amateurs Mr. Douglas was 1st, and Mr. Wheeler 2d, the former showing a handsome plant of *Adiantum concinnum latum*, and good examples of *Todea pellucida*, *Adiantum cuneatum*, &c. For twelve Heaths Messrs. B. Peed & Son were 1st and Messrs. Jackson & Son 2d, both showing small plants, which call for no further comment. Of *Azaleas* the best half dozen contributed by amateurs came from Mr. James Child, all large in size but not of equal merit, the best being of *Criterion*, *Iveryana*, *arborea purpurea*, and *Duc de Nassau*. Mr. G. Wheeler was 2d. In the open class for twelve and the trade class for six Mr. Turner came to the front with a nice lot, the six especially being of good size, well flowered, and very bright. The sorts were *Madame de Cannart d'Hamale*, *Reine des Fleurs*, *Duc de Nassau*, *Comtesse de Flandres*, *Etendard de Flandre*, and *Duchesse A. de Nassau*. Messrs. James Ivery & Son, Dorking, had the second best dozen. Show *Pelargoniums* were sadly behind the high standard of former years, and we need therefore only say that Mr. Turner and Mr. Wiggins, gr. to W. H. Little, Esq., were the only exhibitors, and that 1st prizes were awarded to both.

To the miscellaneous class large collections of new, rare, ornamental, or botanically interesting plants were contributed by Messrs. E. G. Henderson & Son, Mr. William Bull, Mr. B. S. Williams; and smaller groups from Messrs. John Laing & Co., Mr. J. W. Wimsitt, Messrs. Osborn & Son, Messrs. Hooper & Co., Messrs. James Carter & Co., and others contributed largely to the general effect.

#### NEW PLANTS CERTIFICATED.

The judges in the new plants department had, as usual, a considerable number of claimants for honours brought under their notice, and the following awards were made:—Botanical Certificate of Merit to Messrs. James Veitch & Sons for *Odontoglossum vexillarium splendens*, which bore three spikes of lovely rose-coloured flowers; *Yucca filamentosa aurea elegantissima*, with golden longitudinal bands instead of white as in *Y. filamentosa variegata*; *Adiantum monochlamys*, a Japanese species of small size, remarkable for the solitary sorus on each pinnule; *Trichomanes parvulum*, a minute species, with fronds half an inch in diameter, growing on the stem of a dead Tree Fern; *Lastrea Maximowiczii*, a fine Japanese evergreen species with hard glossy fronds finely cut; *Lastrea Richardsii multifida*, with the apices of the pinnae finely tasselled; *Burbridgea nitida*, *Pothos celatocaulis*, already described; *Anthurium Scherzerianum* Rothschildianum, the new spotted form figured last

week; *Oncidium concolor majus*, the largest flowered form of this fine yellow Orchid that we have yet seen; and *Crinodendron Hookeri*, a rare Chilean plant of an Azalea-like habit of growth, with large crimson pitcher-shaped flowers. To Mr. William Bull for *Masdevallia bella*, *Sarracenia purpurea sanguinea*, with pitchers of a dark blood-red colour; *Sarracenia flava ornata*, *Croton Cheltonii*, a species introduced from the New Hebrides, with narrow, elegantly arching leaves, of green and gold nicely blended; *Microstylis calophylla*, a pretty thing to grow with *Bertolonia*s and plants of a like character, having leaves of a brownish bronzy body colour, broadly margined with pale silvery-green, and spotted with a deeper shade of the same colour. To Mr. B. S. Williams for *Lycopodium ulcifolium*, with drooping dichotomous stems; *Croton Warremi*, a singularly distinct form with long spirally twisted and otherwise contorted leaves, variegated with bronze-green, golden-yellow, and crimson; *Ikora Pilgrimi*, a seedling raised by Mr. Pilgrim, of Cheltenham, with remarkably bold foliage, and large trusses of orange-buff flowers, a fine exhibition plant; and for *Maranta Gouletii*, a species with great-growing leaves about 6 inches long, 3 inches wide, silvery-grey in colour, with a margin of green about half an inch wide. To Messrs. E. G. Henderson & Son for *Asparagus consanguineus*, a remarkably handsome climbing species, with dense plumose, leafy branchlets, pale green at first, and finally assuming a much darker shade of the same colour; for *Lycopodium ulcifolium*, and *Sarracenia flava ornata*.

Floral and Certificates were awarded to Messrs. E. G. Henderson & Son for a very pretty double white Fairy Rose named Little White Pet; to Mr. Turner for *Pelargonium Mrs. H. Cox*, a very pretty tricolor; to Messrs. F. & A. Smith, Dulwich, for an *Epiphyllum* raised between E. crenatum and E. Ackermannii, with large brilliant scarlet flowers shaded with violet-purple; to Mr. J. Wiggins for decorative *Pelargonium Reamie*, scarlet with maroon blotch; *Criterion*, in the way of Reamie, but with a bold white centre; and Miss Mary Gill, pink ground with maroon blotch and crimson shade; to Messrs. John Laing & Co. for *Calceolaria Stanstead Rival*, a white ground flower heavily spotted with crimson; to Messrs. James Veitch & Sons for *Gloxinia Coronet*, a pretty reticulated flower with a very dark band round the throat, and extending half-way down the tube; to Messrs. John Laing & Co., for *Begonia Mrs. Laing*, a very finely formed white flower, of the tuberous-rooted section; and to Mr. B. S. Williams, for *Begonia Vandermeulen*, a variety of the Rex type, with leaves of a metallic bronze colour in the centre, broadly margined with silvery-grey, and edged with dark green.

**Scottish Horticultural Association.**—The ordinary monthly meeting of this Association was held in 5, St. Andrew Square, Edinburgh, on Tuesday, May 4; the President, Mr. M. Dunn, Dalkeith Park Gardens, in the chair. Mr. F. W. Burbidge, Curator, Botanic Gardens, Dublin, sent a paper to the meeting, which was read by the Secretary, the subject of it being "Nepenthes at Home and Abroad."—Few plants are of more interest in gardens than well grown *Nepenthes*; so distinct are the thirty or forty species of them that there is not the slightest difficulty in at once recognising any of them, the genus being one of the best marked in the whole vegetable kingdom. In tropical jungles, where they mostly abound, the pitchers of *Nepenthes* are noted to be insect traps of the most deadly description, and it has been thought and stated that the insect *d'bris* contained in the pitchers abroad in some way affords the plant manurial stimulants which from some reason or other they are unable to obtain in the usual way, that is to say, by root-action. One of the great features connected with *Nepenthes* is that their roots are peculiarly fine and delicate in structure, although in some instances their top-growth of leaf and stem is very robust, and it has occurred to me to ask how it comes to be that when struggling for life in their native habitats, surrounded by rampant vegetation of all kinds, they are able to compete successfully in a battle wherein, from their weak rooting character, they very naturally may be expected to fail. But if it is the case, as it has been alleged by many, that they are able to take advantage of the insect food as dissolved by the peculiar digestion-ferment naturally secreted in their urns, we see a way out of the difficulty, the power of absorption and assimilation possessed by the leaf compensates for weak root-action. One of the latest discoveries of modern physiological science is that plants have the power of absorption by their leaves. Mr. Burbidge then referred to the natural conditions under which they are found abroad, Borneo being said to be the "head centre" or focus of the genus, since by far the greater number of known species are natives of that island. He then described all the different kinds as seen by himself in Borneo.

Mr. Geo. Robertson, Mordington Gardens, Berwick-on-Tweed, communicated a paper on the culture of herbaceous plants, and explained his method of keeping up a continuation of bloom with these plants which in gardening establishments were far too much neglected. The Winter Aconite, he said, may be called the first flower of the season; it was easily cultivated, and would grow almost in any soil, and being tuberous-rooted can be propagated by division of the roots early in autumn. *Helleborus*, known as the Christmas Rose—no collection of herbaceous

plants should be without this class of plants; some of the species flower in December, and continue to bloom up to April, providing they have a favourable winter. The kinds that flower in this way are *olympicus*, *abchasicus*, and *foetidus*, the latter being the ever-green flowering species. *Helleborus* foliage is very useful for winter decoration. They are increased by division of the roots, which is best performed early in autumn. The soil selected for their cultivation should be of a moderately moist nature. Snowdrops, *Crocus*, *Leucojum vernum*, *Hepatica*, Dog's-tooth Violets and *Primulas*, were severally described, and a good many useful hints were given as to their cultivation.

Communications were read to the meeting on the effects of the past winter on vegetation in Berwickshire, and on the use of dynamite; they were contributed by Mr. Alexander McMillan, Broadmeadows, and Mr. John Downie, West Coates Nursery, respectively.

Mr. Geo. McClure, Trinity Grove Gardens, received two Certificates for *Auriculas* *Rosebery* and *W. Gladstone*. Messrs. Dicksons & Co., Edinburgh, received a Certificate for a fancy Pansy named *Modesty*; it had a dark velvet ground with a white belting. Messrs. Ireland & Thompson received a Certificate for *Croton interruptus aureus*. Four large new crimson East Lothian Stock in full plants of the flower, which were Highly Commended, came from Mr. John Cowe, Metropolitan Cemetery.

Reference was made to the great loss horticulture had sustained in the death of the late Miss Hope, of Wardie Lodge. Her great love for flowers has already been fittingly referred to in the *Gardeners' Chronicle*.

The great benefits conferred upon horticulture by the labours of the late Robert Fortune, was referred to by the President, who said no man had done more in his day for horticulture abroad.

May 13.—A very fine, bright, warm day. Cloudless at night.  
 14.—A very fine, bright, clear day. Warm.  
 15.—A beautifully fine warm day. Strong wind.  
 16.—A very fine clear day. Not quite so warm. Strong wind. Cold at night.  
 17.—Overcast to 10.30 A.M.; very fine and clear afterwards. Much cooler. Strong wind.  
 18.—A fine day, partially cloudy. Cool. Strong wind. Cold at night.  
 19.—A fine day, but dull and very cloudy. Cold, especially in early morning. Temperature increased towards midnight.

**LONDON: Barometer.**—During the week ending Saturday, May 15, in the vicinity of London the reading of the barometer at the level of the sea increased from 30.22 inches at the beginning of the week to 30.39 inches by the morning of the 9th, decreased to 29.93 inches by the afternoon of the 11th, increased to 30.19 inches by the night of the 13th, decreased to 30.09 inches by the afternoon of the 15th, and increased to 30.15 inches by the end of the week. The mean reading for the week at sea level was 30.10 inches, being 0.11 inch above that of the preceding week, and 0.18 inch above the average.

**Temperature.**—The highest temperatures of the air observed by day varied from 76° on the 15th, and 76° on the 14th, to 50° on the 10th; the mean value for the week was 64½°. The lowest temperatures of the air observed by night varied from 35½° on the 10th, to 46½° on the 15th; the mean value for the week was 42°. The mean daily range of temperature in the

week was 24½°, the greatest range in the day being 34° on the 14th, and the least 14½° on the 10th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—May 9, 44° 8', —6° 7'; 10th, 42° 2', —9° 1'; 11th, 49°, —2° 2'; 12th, 51°, —0° 1'; 13th, 52° 6', +1° 5'; 14th, 56° 4', +5° 1'; 15th, 58° 2', +6° 5'. The mean temperature of the air for the week was 50° 6', being 1° below the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 155½° on the 14th, 148° both on the 13th and 15th, and 144° on the 11th; on the 10th the reading did not rise above 65°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 31° on the 10th, and 31° both on the 9th and 13th; the mean of the seven lowest readings was 35°.

**Wind.**—The direction of the wind was E. and N.E., and its strength strong.

The weather was somewhat dull and cold on the first three days of the week, but fine and warm afterwards.

**Rain.**—No rain fell.

**ENGLAND: Temperature.**—During the week ending Saturday, May 15, the highest temperatures of the air observed by day were above 75° at Truro, Blackheath (London), and Cambridge, and below 59½° at Sheffield, Hull, and Sunderland; the mean value from all stations was 66½°. The lowest temperatures of the air observed by night were below 35° at Truro, Cambridge, Wolverhampton, and Hull, and above 39° at Plymouth and Liverpool; the mean value from all places was 36½°. The extreme range of temperature in the week was above 40° at Truro, Blackheath, and Cambridge, and below 21½° at Sheffield and Sunderland; the mean range of temperature in the week from all stations was 30°.

The mean of the seven high day temperatures was above 64° at Truro, Blackheath and Cambridge, and below 55° at Sheffield, Hull and Bradford; the mean value from all places was 41½°. The mean of the seven low night temperatures was below 40° at Bristol, Cambridge, Wolverhampton and Hull, and above 44° at Truro, Plymouth and Norwich; the average value from all stations was 41½°. The mean daily range of temperature in the week was above 24° at Blackheath and Cambridge, and below 13½° at Norwich, Sheffield, Leeds and Bradford; the mean daily range from all places was 17½°.

The mean temperature of the air for the week from all stations was 48½°, being 1½° higher than the value for the corresponding week in 1879. The mean temperature was above 51° at Truro and Plymouth, and below 47° at Wolverhampton, Sheffield, Hull, Leeds, and Bradford.

**Rain.**—The amounts of rain measured during the week varied from 0.73 inch at Leicester, and 0.58 inch at Wolverhampton, to 0.01 inch at Brighton. At Blackheath no rain fell. The average fall over the country was 0.23 inch.

The weather during the week was generally fine and bright, with cold winds.

**SCOTLAND: Temperature.**—During the week ending Saturday, May 15, the highest temperatures of the air observed by day varied from 61½° at Glasgow to 55½° at Aberdeen; the mean value from all stations was 58½°. The lowest temperatures of the air observed by night varied from 30° at Perth to 37° at Greenock; the general mean from all places was 34½°. The mean range of temperature in the week from all places was 24½°.

The mean temperature of the air for the week from all stations was 47½°, being ½° lower than the value for the corresponding week in 1879. The mean temperature was the highest at Glasgow, 49½°, and the lowest at Edinburgh and Leith, 46½°.

**Rain.**—The heaviest fall of rain was 0.29 inch, at Edinburgh; and the least fall 0.02 inch, at Perth. At Dundee no rain fell. The average fall over the country was 0.13 inch.

JAMES GLAISHER, F.R.S.

## Enquiries.

*He that questioneth much shall learn much.*—BACON.

A BRAZILIAN GARDENING PAPER.—"Barnes" asks for particulars of any widely circulating gardening paper published in Brazil.

BEES IN THE HOUSES.—Is there any arrangement of the lower panes of glass in greenhouses and hothouses which will allow them to open so as to allow bees to escape? My hothouses get full of bees in the summer; and they, flying against the glass, gradually work their way down to the corner, where the lowest pane touches the sole-plate, and die there by dozens. Should those panes be made to lift up, or what is the best way of letting them out, for I neither wish the gardeners to be stung or the bees to be killed? *J. R. Hug, Blairhill.*

A SUBSTITUTE FOR BOX.—What am I to plant instead of Box edging? It won't grow in my garden, though various gardeners have tried their hands at it. It dies

out, do what you will. *J. R. H.* [Try seedling Oaks kept cut in, or Spruce Firs similarly treated or dwarf Euonymus, or common Thrift. *EDS.*]

WATER-TIGHT RESERVOIR.—Will any reader of the *Gardeners' Chronicle* who has practical experience on the subject kindly give their opinion as to the most effectual way of making a small reservoir perfectly water-tight. The reservoir in question is 24 yards square by 7 feet 6 inches in depth. It has sloping sides both inwardly and outwardly, the top of the bank being 5 feet in width. About 6 feet of the bank is above the level of the surrounding ground. It was made some twelve years ago, and was puddled with clay and lined with brick, laid flatways in cement, but I believe it never held water from the first, and has been out of use for the past nine or ten years. Strong Thistles grow through the puddle on the inner banks now. Will puddle well put on keep these back, in case the reservoir is not always full? *H. J. C.*

Answers to Correspondents.

ASPARAGUS: *J. A.* By all means set young plants if you make a new bed.

ASPHALTE.—If "G. G." will mix to the consistency of mortar gas-tar and coal-ashes (sifted through a half-inch riddle), and lay on his walks evenly to the depth of an inch, and after three or four days roll it well with a heavy garden roller, and afterwards give it a coat of gas-tar alone, evenly spread over with an old broom, then dust some dry sand over it, he will have walks that will not become soft under the sun's influence; and by giving them a coat of tar every spring they will always be in good order. *W. Comfort.*

BOOKS: *Barnes.* M. Oswald de Kerchove's recently published book on Palms (in French) is the only one likely to be of any service to you.

CHERRIES: *Geo. Waller and D. J. LeGrevé.* The terms "White Heart" and "Bigarreau" may be taken as synonymous, although the old English White Heart Cherry is quite distinct from any of the Bigarreus, so called, of the present day. The Bigarreus have usurped the place and the name of White Heart.

CRYSANTHEMUM CORONARIUM: *H. Cannell.* C. coronarium luteum seems to be a good decorative plant, so far as can be judged without seeing the habit or foliage; the C. coronarium album, sent with it, is merely a form of C. frutescens.

DISEASED VINES: *Messrs. Methven.* The specimens you send throw no light on the cause of the disaster. We should imagine there is something wrong in the border which has killed the young roots.

DOUBLE-FLOWERED RIBES: *D. D.* A very pretty plant, which is not nearly so common as it deserves to be.

FUNGUS GROWTH: *T. S.* A root-like Fungus, not uncommon in similar situations.

FUNGUS: *Forester, Roschaugh.* The name of the fungus on the Fir is Peridermium pini. It is briefly adverted to this week in our article on the Sempervivum Disease.

FUNGUS ON ROSE LEAF: *A. Z.* The fungus is the "Rose Brand," Phragmidium mucronatum. We do not know that you can do anything better than cut off the affected leaves to prevent it spreading.

HEDGE BLIGHTED: *D. H.* Judging from the scrap you send, the shoot appears to be covered with some fungus. Clip the hedge, and burn the trimmings.

HOT-WATER PIPES: *Alpha.* We do not see how wrought iron pipes can "give out" more heat than cast ones—all depends on the heat you put into the water. We should prefer the cast ones. For the span Cucumber-house you should put in no less than four pipes along each side, exclusive of what may be necessary for bottom-heat.

INSECTS: *C. & R.* Your Currant trees are attacked by the young caterpillars of the common Currant or Magpie Moth. Hand-picking is the best remedy, the insects being so conspicuous. *I. O. W.—J. J. M.* The branch of your pyramid Apple tree has been bored into by the young caterpillar of the Wood Leopard Moth (*Zeuzera aesculi*). *I. O. W.*

INTERNATIONAL FLOWER SHOW: *Quill Pen.* No.

JUDGE'S BOOKS: *T. Pickworth.* At the Field Office, Strand, W.C.

MANURES: *F. S.* What you suppose to be a sample of guano is certainly not that article, but probably a prepared mixture, the composition of which we cannot determine without chemical analysis. The other sample seems to be a mixture of sand and some crystalline substance, perhaps sulphate of ammonia or nitrate of soda. As the composition of both are so uncertain, try them first on some pot plants.

MICE: *G. F. W.* We have no experience in the matter, but we doubt whether the plan in question would be any more cruel than the use of strychnine, arsenic, phosphorus, and the like.

MIMULUS: *Subscriber.* Hose-in-hose flowers of Mimulus are by no means common, though similar specimens to yours have come under our notice before. It is worth perpetuating if you can do it.

NAMES OF PLANTS: *W. Farr.* Brassia verrucosa.—*H. J.* Odontoglossum; specimen incorrect.—*J. R. Haig.* Saxifraga granulata flore-pleno.—*B. G.* Neither an Acacia nor a Lilac, but the Bird Cherry

(Cerasus Padus). Surely a gardener should be able to tell an Acacia from a Lilac, and either from a Cherry.—*Wm. Foster.* A variety of Bifrenaria Harrisonia.—*C. W. D.* The true Veronica spicata.—*F. Rowdon Smith.* Dendrobium moschatum.—*Robert Andrews.* Rhododendron calophyllum.—*Put.* Oxylobium ellipticum.—*J. A. Battram.* Not a Lily, but Dracunculus vulgaris. It is a half-hardy plant, and should therefore be kept in the greenhouse during winter.—*Enquirer.* 1. Saxifraga granulata flore-pleno; 2. Cupressus sempervirens; 3. Prunus Padus.—*W. Davidson.* Prunus Padus.—*H. G.* 1. Vaccinium ovatum; 2. Gaultheria Shallon. *H.* Send better specimens. We cannot waste time over such scraps.—*Rufus.* Meyenia erecta.—*M. J.* 1. Clematis montana; 2. Prunus myrobalana; 3. Selaginella cuspidata; 4. Trichomanes speciosum; 5. Athyrium Filix femina, a form of; 6. Callipteris esculenta.—*F. B.* Linnanthus Douglasii. *S. Ford.* Begonia cuculata.

PRIMROSES: *G. R.* Many thanks. All Primroses, though very variable in colour, &c.; not a true Oxlip nor a Cowslip among them. It is interesting to learn that they all originated from an ordinary Primrose root some three or four years ago.—*J. W. C.* A well-known variety, in which the calyx assumes more or less of the guise of the corolla. It has been asserted that the condition might be produced by pinching out the corolla at an early stage, but we are sceptical on that point.

RANUNCULUS: *Dublin.* A very old-fashioned variety, the name of which has slipped from our memory.

ROSES: *D.* We think the Rose shoots have died through exhaustion, the plants having been injured by the winter's frost, and the effort to grow having used up the little remaining vitality. The first evil may have been the immature condition of the wood.

TROFOLIUM MAJUS AURANTIACA PLENISSIMUM: *H. Cannell.* This looks to be distinct in colour from the other double-flowered Nasturtiums, being of a more coppery-orange colour than any we have before seen. Probably, like the other doubles, it will be useful.

\*.\* Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see. Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

Markets.

COVENT GARDEN, May 20.

The improvement experienced last week has not been maintained, and generally prices have had to give way. *James Webber, Wholesale Apple Market.*

Table with 2 columns: FRUIT and s. d. s. d. Items include Apples, Lemons, Melons, Oranges, Pears, Pine-apples, Strawberries.

Table with 2 columns: VEGETABLES and s. d. s. d. Items include Asparagus, Lettuce, Cabbage, Mint, Mushrooms, Onions, Parsley, Peas, Carrots, French, Potatoes, Cauliflowers, Celery, Rhubarb, Seakale, Small salad, Spinach, Tomatoes, Turnips.

Potatoes:—Regents, 80s. to 120s.; Flukes, 120s. to 160s.; and Champions, 170s. to 190s. per ton. German, 1s. 6d. to 5s. per bag; Channel Islands, 2d. to 3d. per pound.

Table with 2 columns: PLANTS IN POTS.—WHOLESALE PRICES. and s. d. s. d. Items include Arum Lilies, Bedding Plants, Begonias, Bouvardias, Calceolarias, Cinerarias, Cyperus, Dracena terminalis, Erica, Euonymus, Ferns, Ficus elasticus, Foliage Plants, Fuchsias, Genista, Lilium eximium, Lobelia, Mignonette, Myrtles, Nasturtiums, Pelargoniums, Ivy-leaved, Tricolor, Roses, Spirea, Stocks.

Table with 2 columns: CUT FLOWERS.—WHOLESALE PRICES. and s. d. s. d. Items include Abutilon, Anemone, Arum Lilies, Azalea, Bouvardias, Camellias, Carnations, Cornflower, Cowslips, Eucharis, Euphorbia, Forget-me-not, Gardenias, Heirotropes, Lily of the Valley, Mignonette, Narcissus.

SEEDS.

LONDON: May 19.—The attendance of buyers to-day was very small, and the market presented quite a holiday appearance. As regards values there is consequently no change to report; but owing to the unfavourable accounts received of the new crops, Clover and Trefoil are both held with increasing firmness. There is now more inquiry for Mustard and Kape seed for sowing purposes; both varieties are in short supply, and quotations are hardening. The remarkably low rates current for fine Canary seed are attracting the attention of speculators; Hemp seed also keeps exceedingly moderate. Spring Tares being exceedingly scarce are dearer. There is an improved sale for blue Peas; fine samples are now rarely met with. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

Monday being a statute holiday there was no business done on Mark Lane. Trade on Wednesday was on the whole rather firm. There was very little English Wheat on offer, and with next to nothing doing prices were nominally without change. Foreign Wheat, too, was very quiet, and there was no material change observable. The tone was hardly so good. Barley met with a small inquiry, and remained about the same in price. Malt was neglected. Oats were in pretty good demand. Prices were about 3d. per quarter higher than last week. Maize was firm and the turn dealer. Beans and Peas supported late values, but the market for flour was dull and a trifle easier.—Average prices of corn for the week ending May 15:—Wheat, 44s. 9d.; Barley, 32s. 2d.; Oats, 24s. 11d. For the corresponding period last year:—Wheat, 40s. 8d.; Barley, 30s. 1d.; Oats, 21s. 11d.

CATTLE.

At the Metropolitan Market on Monday trade in beasts was slow, and prices on the average scarcely as good as on the Monday previous. Trade in sheep also was very slow, and a clearance was not effected. Lambs gave way in price, and calves were rather lower than last week. Quotations:—Beasts, 4s. 4d. to 5s., and 5s. 3d. to 5s. 8d.; calves, 5s. 4d. to 6s. 8d.; sheep, 5s. 4d. to 5s. 8d., and 6s. 4d. to 6s. 10d.; lambs, 7s. 8d. to 8s. 2d.; pigs, 4s. 6d. to 5s. 4d.—On Thursday beasts were in moderate supply, and there was a slow trade at barely Monday's rates. Sheep also were in slow request, and drooping in value, but lambs were rather dearer. Calves sold at about late rates.

HAY.

At the Whitechapel Market on Tuesday the supply of fodder was short, but there was not much doing at the following quotations:—Prime Clover, 100s. to 132s.; inferior, 60s. to 95s.; prime meadow hay, 80s. to 102s.; inferior, 30s. to 70s.; and straw, 30s. to 38s. per load.—On Thursday a moderate supply of hay and straw was on offer. There was a quiet trade at about Thursday's quotations.—Cumberland Market quotations:—Superior meadow hay, 95s. to 105s.; inferior, 45s. to 102s.; superior Clover, 120s. to 130s.; inferior, 84s. to 110s.; and straw, 34s. to 40s. per load.

POTATOS.

The occurrence of the Whitsuntide holidays has, as a matter of course, affected the amount of business done on the market, and prices are quoted somewhat lower than last week.—During last week 20,358 bags were received at London from Hamburg, 2315 Stettin, 7180 Danzig, 5525 Malta, 21,942 bags from Lisbon.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The planer sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "grown" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E. Agents for LOOKER'S PATENT "ACME FRAMES," PLANT COVERS, and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS.

Illustrated Price Lists free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 3s. per square yard upwards. Pattern Sheet of Plain or more elaborate Designs, with Prices, sent for selection.

WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability, Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety, Slates, Cement, &c. F. ROSHER AND CO., Brick and Tile Merchants. See Addresses above.

SILVER SAND, fine or coarse grain as desired. Price by post per Ton or Truckload, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post. FLINTS and BRICK BURRS for Rockeries or Ferneries. KENT PEATS or LOAM supplied at lowest rates in any quantities.

F. ROSHER AND CO.—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

Gentlemen's Gardeners, Amateurs, and Others

REQUIRING GARDEN POTS of best quality, are requested to send their orders to J. MATTHEWS, Royal Pottery, Weston-super-Mare. Price List on application.

"THE GARDEN" POTTERY.—"Your pots are the best."—Mr. PAYNE, Gr. to the Rt. Hon. and Rt. Rev. the Lord Bishop of Bath and Wells. Works:—Chilcompton and Evercreech Junction Stations. Address:—T. J. HICKES, Shepton Mallet.

DOULTON & CO., LAMBETH POTTERY, LONDON, S.E.

**COLEMAN AND MORTON'S**  
HAND WATER-CART and GARDEN ENGINE.

For Use in GENTLEMEN'S GARDENS and GROUNDS.

The delivery valve can be worked at the outlet when filling a watering pot. It holds 35 gallons. The Spreader, for watering lawns, &c., can be removed at pleasure.

PRIZE WATER and LIQUID MANURE CARTS.

Prices and particulars on application at the London Road Ironworks, Chelmsford.

Oil Paint No Longer Necessary.

**HILL AND SMITH'S BLACK VARNISH**  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in casks of about 30 gallons each, at 1s. 6d. per gallon at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sirs,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE of Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 180, Buchanan Street, Glasgow.

**PETTIGREW'S STRAW HIVES.**

Large well made Hives, of very superior workmanship, as supplied to Mr. Pettigrew, at moderate prices. Catalogues of Hives and Appliances for the Apiary, post-free.

SAMUEL YATES, 16 and 18, Old Millgate, Manchester.

**LAWN MOWER (Second-hand) for SALE.**

In good condition. A 24-inch, Green's Patent. No reasonable offer refused.—Apply to F. AND H., Panklibanon Company, 56, Baker Street, Portman Square, London, W.

**NETTING for FRUIT TREES,**

SEED BEDS, RIPE STRAWBERRIES, &c. TANNED NETTING for protecting the above from Frost, Blight, Birds, &c., 2 yards wide, 3d. per yard, or 100 yards 20s.; 4 yards wide, 6d. per yard, or 50 yards 20s.

NEWTANNED NETTING, suited for any of the above purposes, or as a Fence for Fowls, 2 yards wide, 6d. per yard; 4 yards wide, 1s. per yard, 3/4-inch mesh, 4 yards wide, 1s. 6d. per yard. TIFFANY, 5s. and 6s. per piece of 20 yards.

To Nurserymen

WANTED, AT ONCE, an experienced MAN, to Manage a small Nursery. He must understand Inside and Outside work.—J. C. PADMAN, Nurseryman, Boston Spa, Yorkshire.

WANTED, as SECOND GARDENER, a steady industrious young Man, for the Houses. Wages £1 per week, no bothy.—H. BATCHELOR, Catton Park, Norwich.

WANTED, a young man as UNDER GARDENER or UNDER FORESTER, with a Bass Voice. Accustomed to Sing in a Choir. A fair knowledge of Music is required. Churchman.—R. E. BARRETT, Camserney Cottage, Aberfeldy, N. B.

WANTED, a GARDENER—a thoroughly respectable, steady, and industrious man, with several years' good personal character—to take charge (with some help) of about two acres, including a large proportion of Lawn, and with only one very small Greenhouse. No cottage provided.—Apply, by letter, stating wages expected and all particulars, to T. S. L., Messrs. Philip D. Tuckett & Co., 10, Old Broad Street, E.C.

WANTED, a MAN and his WIFE, to act as Care-taker and Gardener to St. Paul's Schools, Wellclose Square, E., and the Woman as general Care-taker and Cleaner to the Infant Nursery in the same grounds. Members of the Church of England, and under 45 years of age. Salary 24s. per week, with two rooms, coals, and gas.—Apply, by letter or personally, to the Rev. DAN. GREATOREX, St. Paul's Vicarage, Dock Street, London Docks, E.

WANTED, an experienced CUCUMBER GROWER, to have the sole Management of three Houses in course of erection.—State wages and reference to J. G. MITCHINSON, Seed Stores, Penzance.

WANTED, a MAN experienced in Propagation and Growing of Stove Plants under a Foreman. Must be well recommended.—F. AND A. SMITH, West Dulwich, S. E.

WANTED, a respectable young MAN, in the Houses, &c., under a Foreman.—Must have a knowledge of Stove and Greenhouse Plants. Wages 17s. and bothy.—Apply by letter to D. DONALD, Leyton, London.

WANTED, one or two good quick hands at Grape Thinning. State wages; overtime made.—Apply to Mr. WOODTHORPE, Glazenwood Nurseries, Braintree.

WANTED, as BOOK-KEEPER and CORRESPONDENT, an energetic and active Man. Must be able to give unexceptionable references.—Apply in own handwriting, stating age, experience, and wages expected, to ALPHA, Messrs. Hurst & Sons, 6, Leadenhall Street, E. C.

WANT PLACES.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

JOHN COWAN, The Vineyard and Nursery, Garston, can with every confidence recommend a GARDENER (married, without family), to any Nobleman or Gentleman requiring the services of a highly accomplished and thoroughly trustworthy man.

To Gentlemen and Market Growers.

MANAGER, to a Gentleman with a large amount of glass, or intending to build, to grow expressly for a first-class Market Trade. Fruit, Cut Flowers, &c.—Age 35. Well up in erection of suitable houses for market work. Highest references.—ALPHA, 2, Junction Terrace, Falcon Road, Clapham Junction, London, S. W.

To Single Gentlemen or Ladies.

GARDENER and MANAGER, and COOK and HOUSEKEEPER.—A respectable couple want situations where no other servants are kept. Man, first-class Gardener and Manager on Home Farm, good Penman and Accountant; has taken Prizes for Fruits and Flowers at Horticultural Shows. Wife excellent Plain Cook and Housekeeper; can make Fancy Bread, Butter, and is successful at rearing Poultry. Both are economical in their business, and tidy in person and work; have one boy, who could act as Page, Pantry-boy or Valet. Testimonials from Noblemen and Clergymen, first-rate as to character and capabilities. English Protestants. Full particulars given by applying by letter to A. B. C., Gardener, 18, Thornhill Crescent, Barnsbury, London, N.

GARDENER (HEAD).—Married, no children.—Thoroughly practical; steady and industrious. Highly recommended by former employers.—J. MACDOUGALL, 2, Leverton Place, Kentish Town Road, N. W.

GARDENER (HEAD).—Age 35; twenty-three years' practical experience in all the various branches of the profession.—A. B., 24, College Street, Putney, S. W.

GARDENER (HEAD), where two or more are kept.—Married, no incumbrance; nineteen years' experience.—Address P. C., The Lodge, Hartlebury Castle, near Kidderminster.

GARDENER (HEAD).—H. BENHAM, Head Gardener to the Earl of Stradbroke, Henham Hall, Wrangford, can with confidence recommend his Foreman, G. Eden, to any Lady or Gentleman requiring a good practical man. Address as above.

**GARDENER (HEAD).**—A LADY will be glad to hear of a situation for a Head Gardener, and will answer any questions.—POLMEAR, Avenue Road, Southgate, N.

**GARDENER (HEAD).**—Married; thoroughly understands Early and Late Forcing all kinds of Fruit, Flowers and Vegetables, and Flower and Kitchen Gardening; also the Management of a Home Farm. Wife could take Dairy or Poultry. Excellent character.—A. B., 11, Clarence Villas, St. Mary's Grove, Richmond, Surrey.

**GARDENER (HEAD).**—Married; eighteen years' practical experience. Well up in the Forcing of all kinds of Fruit, Flowers, and Vegetables, Kitchen and Flower Gardening. Six years Head Gardener in last situation, from which excellent testimonials will be given, and satisfactory reasons for leaving.—R. G., Mr. Bailey, Peopleton, Pershore, Worcester.

**GARDENER (HEAD);** age 34, married.—The ADVERTISER would be pleased to treat with any Nobleman or Gentleman requiring the services of a thorough practical and trustworthy man, who has had the Management of an extensive place for nearly four years. Satisfactory reasons for leaving. His late employer is prepared to give him the highest testimonials as to character and abilities.—GARDENER, Mr. King, Wharf Road, Grantham, Lincolnshire.

**GARDENER (HEAD, WORKING).**—Age 30; fourteen years' experience. Thoroughly practical in all branches. Could take charge of Cows. Good recommendation.—A. AGATE, Swattenden Park, Cranbrook, Kent.

**GARDENER (HEAD, WORKING, or SINGLE-HANDED).**—Single; well up in Fruit Houses and Flower and Kitchen Gardening. Nine years' first-class reference.—J. W. COLLINS, Bookseller, Stroud, Gloucestershire.

**GARDENER (HEAD, WORKING).**—Thorough practical knowledge in all branches. Country preferred.—A. SINCLAIR, 8, Eleanor Cottages, Stanley Road, East Sheen, Mortlake, Surrey.

**GARDENER (HEAD, WORKING).**—Age 37, married; twenty-four years' practical experience in all branches of the profession. Six years in last situation.—C. M., 9, Eltringham Street, York Road, Wandsworth, S.W.

**GARDENER (HEAD, WORKING).**—Thoroughly practical in all branches of Gardening, and competent to undertake the Management of a good place. Excellent testimonials and character.—J. WOOLFORD, Roby, Sydenham Hill, S.E.

## WHISKERS

Send for a Bottle, as it is guaranteed to effect this marvellous change in a few weeks.

Never fails.

BEFORE USE. SAVILLE'S. AFTER USE.

**CAPILLARY GERMINATOR** has been proved by hundreds to be the only real producer of Whiskers and Moustaches and Curer of Baldness.

**PRESS OPINIONS.**—“Decidedly the most efficacious and rapid in its operation of any preparation of the kind. A thoroughly reliable Hair Producer.”—*London Press*. “Just what it professes to be—in effect.”—*Irish Press*.

Of all Chemists and Perfumers. Sent to any address, carriage paid, free from observation, with testimonials, directions for use, &c., on receipt of 2s. 6d. Larger sizes, 4s. 6s., and 11s. Carriage paid, 1s. extra. JOHN F. SAVILLE AND SONS, 145, Regent's Park Road, London, N.W.

**Important Caution! Beware!**—Many persons are copying our title and advertisements. This is the original and only genuine “Capillary Germinator.” Buy no other. Above title (registered) is moulded in every bottle.

**KINAHAN'S LL WHISKY**

**KINAHAN'S LL WHISKY.** Pure, Mild and Mellow, Delicious and Most Wholesome. Universally recommended by the Profession. The Cream of Old Irish Whiskies.

**KINAHAN'S LL WHISKY.** Dr. Hassall says—“Soft and Mellow, Pure, well Matured, and of very excellent quality.”

**KINAHAN'S LL WHISKY.** Gold Medal, Paris Exhibition, 1878; Dublin Exhibition, 1865, the Gold Medal.—20, Great Titchfield Street, London, W.

“By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood, and a properly-nourished frame.”—*Civil Service Gazette*.

**EPPS'S COCOA.**

**GRATEFUL**

AND

**COMFORTING.**

JAMES EPPS AND CO., HOMOEOPATHIC CHEMISTS.

**“OLD DR. JACOB TOWNSEND'S” SARSAPARILLA. THE BLOOD PURIFIER.**

This extraordinary Medicine has a singular influence upon the blood, which it enriches and purifies. It removes all pimples and blotches, purifies the system, and acts like a charm. As a sustaining and purifying tonic it is invaluable, and highly recommended in long-standing cases of indigestion, nervousness, coughs, colds, scrofula, gout, dropsy, and wasting of flesh. Sold by all druggists. Caution.—Get the red and blue wrapper, with the Doctor's head in the centre. No other genuine. In bottles, 2s. 6d., 4s. 6d., and 11s.—131, Fleet Street, E.C.

**DINNEFORD'S MAGNESIA.**

The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for

**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, AND INDIGESTION,**

and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**

**HOLLOWAY'S OINTMENT and PILLS.**

—Debilitated Constitutions—When climate, age, or hardships have undermined the health, skin diseases are prone to arise and augment the existing weakness. Holloway's medicaments daily prove most serviceable, even under the most untoward circumstances. This well-known and highly esteemed unguent possesses the finest balsamic virtues, which soothe and heal without inflaming or irritating the most tender skin or most sensitive sore. Holloway's Ointment and Pills are infallible for curing bad legs, varicose veins, swelled ankles, erysipelas, scaly skin, and every variety of skin disease. Over all these disorders Holloway's remedies exert a quick and favourable action, and, where cure is possible, gradually but certainly arrive at that consummation. They are invaluable in the cure of scrofula and scurvy.

# GREEN'S PATENT "SILENS MESSOR" & "MONARCH"

NOISELESS LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1880.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on many occasions, H.R.H. the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Upwards of 95,000 of these Machines have been Sold since they were first introduced in the year 1856,

And Hundreds of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are the advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible.
- 2d. They are worked with much greater ease than any other.
- 3d. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either long or short Grass, wet or dry.

## Single-handed Lawn Mower.

*To cut 22 inches.	By Two Men	8 10 0
* If made stronger, suitable for Donkey, 30s. extra.		
*To cut 24 inches.	By Two Men	9 0 0
* If made stronger, suitable for Donkey, 30s. extra.		

Prices of Donkey, Pony, and Horse Machines, including Patent Self or Side Delivery Box, Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

### DONKEY and PONY MACHINES.

To cut 26 inches	... ..	£14 0 0
To cut 28 inches	... ..	16 0 0
To cut 30 inches	... ..	18 0 0
Leather Boots for Donkey	... ..	1 0 0
Leather Boots for Pony	... ..	1 4 0

### HORSE MACHINES.

To cut 30 inches	... ..	£22 0 0
To cut 36 inches	... ..	26 0 0
To cut 42 inches	... ..	30 0 0
To cut 48 inches	... ..	34 0 0
Leather Boots for Horse	... ..	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the Machine.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select out of several hundred Machines, of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, free of cost to the Purchaser.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

## GREEN'S PATENT ROLLERS

For Lawns, Drives, Bowling Greens, Cricket Fields and Gravel Paths.

SUITABLE FOR HAND OR HORSE POWER.

These Rollers are made in two parts, and are free in revolving on the axis, which affords greater facility for turning. The outer edges are rounded off, or turned inwards, so that the unsightly marks left by other Rollers are avoided.

 Seed Grower and Merchant, Gainsborough.

## SALES BY AUCTION.

## Masdevallia rosea.

MR. J. C. STEVENS has received instructions from Mr. F. Sauder to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, May 31, at half-past 12 o'clock precisely, a fine lot of this splendid MASDEVALLIA, described in *Gardeners' Chronicle*, May 1. Professor Dr. Reichenbach says:—"What is Masdevallia rosea? some of our readers may ask. Well, it is a peculiar type of Masdevallia, quite distinct from any species we have, bearing flowers of a length of 11 centimetres, the even sepals are 3 centimetres broad, of a most lovely rich rose-purple, the long tube of an exquisite purple-scarlet. Dr. Lindley sketches it:—Flowers pink, 2 inches long, very showy. This glorious thing, so long desired, was saved from the wrecked ship, *Para*, at St. Michael's, Azores, by our friend, F. C. Lehmann. The very few plants will appear at Mr. Stevens' Rooms to make their European debut. We hope to give soon further details and a woodcut of the queen of Masdevallias. This Masdevallia is most difficult to import, and to Mr. Lehmann's energy and skill we owe that now it is alive in Europe."

The Sale will also contain a fine lot of ODONTOGLOSSUM ALEXANDRÆ LEHMANNI, O. VEXILLARIUM LEHMANNI, O. LUTEO-PURPUREUM, various DENDROBIUMS, CELOGYNES, ODONTOGLOTS, ONCIDIUMS, and other ORCHIDS.

May be viewed the morning of Sale, and Catalogues had.

## Highly Important Sale of Established Orchids.

MR. J. C. STEVENS has received instructions from W. Turner, Esq., Over Hall, Winsford, Cheshire, to offer for SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, June 2, and following days (instead of the days previously announced), at half-past 12 o'clock precisely each day, without the least reserve, the entire COLLECTION of ESTABLISHED ORCHIDS. Amongst other grand things will be found *Lælia Warneri*, *Saccolabium Turneri* (spikes nearly 2 feet long), *Cattleya Skinneri* alba, *C. Morganii*, *C. Wagneri*, *Lælia Williamsi*, and many other rare and valuable plants.

May be viewed the morning of Sale, and Catalogues had.

## Dendrobium Jamesianum

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on FRIDAY, June 4, at half-past 12 o'clock precisely, an importation of the beautiful and rare DENDROBIUM JAMESIANUM, just received from Burmah, where it grows at an altitude of 4000 feet in a cool temperature; added to the beauty of its flowers, the length of time they last makes it a desirable species in every collection. Also good plants of DENDROBIUM HETEROCARPUM, D. NODATUM, D. PRIMULINUM GIGANTEUM, and D. CREPIDATUM.

May be viewed the morning of Sale, and Catalogues had.

## Imported Orchids.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on FRIDAY, June 4, at half-past 12 o'clock precisely, an importation, received direct, of PHALÆNOPSIS GRANDIFLORA, on blocks, in excellent condition; CYPRIPEDIUM NIVEUM, VANDA HOOKERI; also several other importations of ORCHIDS, including *Vanda Lowii*, *Cypripedium Stonei*, *C. Lowii*, *C. Hookeræ*, *Bolbophyllum Beccarii*, *Arundina* species, and an importation of *Vanda corulea*, in splendid condition.

On view the morning of Sale, and Catalogues had.

A Magnificent Importation of *Vanda Lowii*, splendid pieces, in excellent condition; CYPRIPEDIUM LOWII and STONEI, in strong masses; CYPRIPEDIUM HOOKERÆ, very fine; CALANTHE, new species, with variegated leaves; BOLBOPHYLLUM BECCARII, the finest plants ever imported; CELOGYNE PANDURATA, very strong; and many other fine kinds.

MR. J. C. STEVENS has received instructions from Messrs. James Veitch & Sons to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, June 7, at half-past 12 o'clock precisely, by far the finest importation of the above and other splendid kinds which has ever reached this country from Borneo. All the plants are in splendid condition.

On view the morning of Sale, and Catalogues had. Auction Rooms and Offices, 38, King Street, Covent Garden, W.C.

## Choice Imported Orchids.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on TUESDAY, June 8, at half-past 12 o'clock precisely, by order of Messrs. Hugh Low & Co., IMPORTED ORCHIDS, just received from Burmah in large quantities, and in the best possible condition, comprising *Cypripedium Parishii*, *Dendrobium Bensoniæ*, a grand lot, amongst them a splendid mass, 2 feet across, with upwards of 100 bulbs; *D. thyrsoflorum*, *D. luteolum*, *D. Parishii*, *D. capillipes*, *D. senile*, *D. primuminum*, *D. eburneum*, *Aerides virens* Dayanum, *Saccolabium Blumei majus*, &c.

At the same time will be offered fine plants of *Cypripedium Argus*, *C. Haynaldianum*, *C. Boxalli*, *Aerides quinquevulværum*, *A. crassifolium*, *Cattleya Dowiana*, *Vanda lanellata* Boxalli, *V. densisoniana*, *Cymbidium Lowianum*, *Dendrobium superbum* giganteum, in flower or bud; 200 *Cattleya labiata* speciosissima varieties, and other choice ORCHIDS.

On view the morning of Sale, and Catalogues had.

## Valuable Collection of Established Orchids.

MR. J. C. STEVENS has received instructions from Henry Wilson, Esq., Sheffield, to offer for SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY and THURSDAY, June 16 and 17, at half-past 12 o'clock precisely each day, a valuable collection of ESTABLISHED ORCHIDS, comprising choice specimens of most of the leading and well-known varieties.

May be viewed the morning of Sale, and Catalogues had.

## The Floral Hall, Kingsland, N.

## TO FRUITERERS, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at the Mart, Tokenhouse Yard, E.C., on MONDAY, June 7, at 1 o'clock, the two valuable LEASES, GOODWILL, STOCK, and UTENSILS in trade of the Floral Hall, 374, Kingsland Road, N., occupying a commanding corner position, offering an eligible opportunity for securing a remunerative and old-established Fruiterer's and Florist's business.

Particulars and conditions of Sale may be had on the Premises; of R. H. HARRIS, Esq., 46, Finsbury Circus, E.C.; and of the Auctioneers and Valuers, 98, Gracechurch Street, E.C., and Leytonstone, E.

## Established and Imported Orchids.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at the Mart, Tokenhouse Yard, E.C., on MONDAY, June 7, 400 lots of ESTABLISHED ORCHIDS, mostly from Private Collections—for Sale without reserve; also valuable Importations of ORCHIDS, consigned direct from Trinidad and Jamaica, just arrived in fine condition. Further particulars next week.

Catalogues at the Mart, and 98, Gracechurch Street, E.C.

## Acton.

## IMPORTANT SALE of FREEHOLD PROPERTY.

## Dissolution of Partnership.

MR. J. P. HOPE is favoured with instructions to SELL by AUCTION, at the Mart, Tokenhouse Yard, near the Bank of England, E.C., on TUESDAY, June 1, at 2 o'clock, the very valuable FREEHOLD PROPERTY, known as the Lecture Hall, well situated in Church Road, Acton, which, being the only public hall in a parish with 15,000 inhabitants, presents an unusual opportunity of securing a first-class investment. Also the double-fronted detached Freehold Villa, with large Garden, Coach-house, and Two-stall Stable, known as St. Mary's Villa, situated in the Park Road North, Acton; and the Freehold Land, nearly an acre in extent, with valuable frontage to Park Road, known as Temperance Nursery, together with the Greenhouses, Furnaces, and Hot-water Apparatus as fixed; the whole forming excellent home and business premises for a Nurseryman, or suitable for the erection of small Houses, which are much in demand. The Nursery Stock, Vans, Horses, &c., can be taken at a fair valuation, or will be sold by Auction the week after this sale.

Particulars will shortly be ready, and may be obtained of Messrs. RUSSELL, DAVIES and RUSSELL, Solicitors, 59, Coleman Street, E.C.; Messrs. RUSSELL, SON and SCOTT, Solicitors, 14, Old Jewry Chambers, E.C.; at the "Station" and "Prince of Wales" Hotels, Acton; at the Mart; and of the Auctioneer, Mr. J. P. HOPE, (opposite) North London Station, Acton, W.

## City of Ely, Cambridgeshire.

MESSRS. BIDWELL will SELL by AUCTION, at the Reading Room, Ely, on WEDNESDAY, June 23, at 2 o'clock punctually, in 22 or more lots, by direction of the Executors of the late Mrs. Sherard, VALUABLE FREEHOLD and COPYHOLD ESTATES, situate in the parishes of Ely Trinity and Ely St. Mary, containing in all 151 a. or. 23 p. of Accommodation, Pasture and Arable Land, close to the City, and the exceedingly valuable property known as "The Vineyards," in the occupation of Mr. T. Pashler, comprising 14 a. 11 p. of most fertile and productive Garden Ground, in a high state of cultivation, planted with a choice selection of Apples, Pear, Plum and other Trees in full profit and bearing; a large portion of the ground is also well planted with Gooseberry and Currant Bushes, also about 3 acres of Asparagus Beds. Along the West and North boundaries are high Garden Walls for a distance of about 950 feet, facing East and South, well covered with Wall Fruit Trees, and a substantially built Residence, with Lawn and Pleasure Garden, which stands very pleasantly and commands "The Vineyards," with necessary Offices, Fruit House and Stable.

Particulars, with Plans and Conditions of Sale, may be had at the "Lion" Hotel, Cambridge; the "George" Hotel, Huntingdon; "Great Northern" Hotel, Peterborough; the "Estate Exchange," Tokenhouse Yard, London, E.C.; of E. C. SHERARD, Esq., Solicitor, Oundle, Northamptonshire; and of Messrs. BIDWELL, Land Agents and Surveyors, Ely, and 12, Mill Lane, Cambridge.

WANTED to PURCHASE, the FREEHOLD of a MARKET GARDEN or Small NURSERY, or LAND suitable for the above purpose, in a populous district, within easy distance of a large town of not less than 20,000 inhabitants.

B., 7, Davy Street, Wakefield Road, Bradford, Yorkshire.

## Second-Hand Conservatory.

TO BE SOLD, IMMEDIATELY, all the Woodwork, Shelving, Glass and Ventilating Gear of a strong Span-roof Conservatory—size, about 25 feet long by 18 feet wide—at present attached to the mansion belonging to Duncan Graham, Esq., Lydiat House, Willaston, near Hooton, Cheshire, which must be removed at once to enable the contractors (Bennett Bros., Liverpool) to erect a larger conservatory on its site.

For further particulars apply to BENNETT BROS., Horticultural Engineers, Sir Thomas's Buildings, Liverpool.

## Ireland.

TO BE SOLD, by Tender, in consequence of death of Proprietor, the Old Established PARK NURSERY, 1 mile from Wexford Railway Station. Contains 7 Acres, 2 Greenhouses, Propagating and Fern Houses, Foreman's Dwelling, also Seed Warehouse in Wexford. In full work; good connection. Farm of 15 acres, convenient, if required. Long leases. Tenders will be received and fuller particulars given by JOHN HINTON, Auctioneer, Wexford.

## To Nurserymen and Florists.

TO BE LET, or SOLD, a NURSERY, facing Peckham Rye.

For particulars, apply at Friern Nursery, Peckham Rye, S.E.

## Brentford, close to Station.

TO BE LET, well planted GARDEN GROUND, of about 2½ acres, with Stabling, Packing Sheds, Greenhouses, Pits, Water Tanks, &c. Immediate possession can be had. For further particulars, terms, and cards to view, apply to

Mr. SAMUEL GODDARD, Auctioneer, 217, High Street, Brentford, Middlesex.

Now Ready—Good Spring-sown Cabbage and Other PLANTS, &c.

GEE'S superior Bedfordshire-grown Plants, &c., grown from his far-famed selected stocks, can again be supplied in any quantities, as follows, for cash with orders:—CABBAGE PLANTS.—Early Enfield, Nonpareil, Large Drumhead, Thousand-head, and Red Dutch. SAVOY.—Large Drumhead, and Dwarf Green Curled. SCOTCH KALE, BRUSSELS SPROUTS, finest. KOHL RABI.—Large Green.

Golden Perpetual (best yellow), Purity (best white), at 3s. per dozen. Carriage paid on all orders above £1.

T. L. MAYOS, Nurseryman, Hereford.

## New Hardy Fern.

MICROLEPIA ANTHRISCIFOLIA,

a South African Fern, which for delicacy and beauty may be almost compared with the Lace Fern, *Cheilanthes elegans*; proves perfectly hardy, scores of plants having survived the past two winters with us in the open ground without the slightest artificial protection! It grows freely in any light rich soil, either in shade or full sunshine, and runs underground like the common Dracken, forming very pleasing tufts or edgings of light green, with very highly divided fronds, 6 to 9 inches high. As such it will be found very useful as an Edging for Bedding Plants, as well as for Greenhouse Decoration. That such a Fern should have borne the severe and protracted frost of the winter of 1878-9, and again a temperature of 6½° below zero last winter, with only a few inches of snow, is surprising indeed. We imported this pretty species three or four years ago, and can now offer well-established plants at 1s. 6d. each, or 15s. per dozen.

JAS. BACKHOUSE and SON, York Nurseries, York.

TEA SCENTED ROSES,

For Planting Out or Greenhouse Culture.

Upwards of 20,000 strong, well established plants, in pots.

List and Prices on application to

CRANSTON'S NURSERY & SEED COMPANY, Limited, KING'S ACRE, near HEREFORD.

Cheap

Orchids.

B. S. WILLIAMS having recently received from his Collectors and Correspondents in different parts of the world large consignments of ORCHIDS, and through having purchased several Collections in this country, is now in a position to offer good young healthy Plants at more reasonable prices than it has been possible hitherto to sell at. An inspection is respectfully invited. Special LIST of cheap and desirable kinds sent post-free on application. Victoria and Paradise Nurseries, Upper Holloway, London, N.

New Crotons.

IRELAND AND THOMSON have much pleasure in introducing the following superb additions to this splendid tribe of decorative plants:—

CROTON INTERRUPTUM AUREUM.—This is a most distinct and elegant variety. It is a seedling raised at their Craigleith Nursery, originating in a cross between C. interruptum and C. Johannis. It resembles the former most in the form of its foliage, which is interrupted, but being more slender is even more elegant, arching gracefully outwards without the spiral form which characterises that parent. The colour is the deep golden tint of Johannis on a dark olive-green ground colour, the gold predominating. It branches most freely naturally without stopping. For table decoration it is without exception the most elegant and beautiful Croton in cultivation, and is certain to become a favourite exhibition variety. It was awarded a First-class Certificate at the Liverpool Horticultural Association's Show in August, 1879, and was also awarded the same distinction by the Scottish Horticultural Association at the last meeting of its Committee on New Flowers. Price 10s. 6d. each. Terms to the Trade on application.

CROTON DUKE OF BUCCLEUCH.—Among all the trilobate forms this splendid variety stands pre-eminent for the size and the depth of colouring of its foliage. The origin of the variety is a cross between Disraeli and Johannis, the former being the seed-bearing parent. It has the form of the foliage of Disraeli, with greater size and boldness, thus adapting it admirably for bold specimen plants. The colour is that of Johannis with a deeper tint of gold in the mature leaves, the younger leaves being marbled and suffused with gold and deep olive-green. It was awarded a First-class Certificate at the Royal Horticultural Society's Show at Preston in 1878, also at Edinburgh in 1879. Price 10s. 6d. each. Terms to the Trade on application.

Nurseries, Craigleith, Comely Bank, and Royal Exotic, Lynedoch Place; Seed Warehouse, 20, Waterloo Place, Edinburgh.

Cheap Plants.—Special Offer.

WILLIAM BADMAN offers the following Plants:—

PELARGONIUMS—Waltham Seedling, fine crimson; Lucius, salmon, 1s. 6d. per doz., 10s. per 100; Madame Vaucher and Virgo Marie, two best whites, 1s. 6d. per doz., 12s. per 100; Dr. Denny, nearest to blue, fine, 5s. per doz. Pelargoniums, in 12 choice varieties, 4s. per doz., 25s. per 100.

SILVER VARIEGATED—May Queen (Turner's), Flower of Spring, 1s. 6d. per doz., 12s. per 100; Princess Alexandra, very fine, silver edge, 2s. per doz., 15s. per 100; Bijou, 10s. per 100.

BRONZE—McMahon and Black Douglas, both first-class, 2s. 6d. per doz., 18s. per 100.

LOBELIA—Bluestone (true), strong plants, 1s. 6d. per doz., 10s. per 100; smaller, 2s. 6d. per 100, 20s. per 1000.

AGERATUM—Imperial Dwarf, blue, makes a fine bed, 1s. 6d. p. doz., 10s. p. 100; or from stores, 5s. p. 100, 40s. p. 1000.

COLEUS Verschaffeltii and IRESINE Lindeni, crimson leaf, very effective, 1s. per doz., 6s. per 100.

HELiotROPE—Finest dark, strong, from stores, 1s. per doz., 6s. per 100.

DAHLIAS—Best sorts, white, yellow, scarlet, dark rose, &c., 2s. 6d. per doz., 15s. per 100, good plants.

TROPÆOLUM—Vesuvius, scarlet, dwarf and free, 10s. per 100.

NIPHETOS—Pure white Tea Rose, strong stuff from stores, on own roots, 30s. per 100, 5s. per doz.

Packing included. Terms cash. Cemetery Nursery, Gravesend.

MESSRS. THOMAS CRIPPS AND SON

are now sending out the undermentioned three new CLEMATISES, all of the viticella or Jackmanni section:—

EARL BEACONSFIELD (T. Cripps & Son).—A splendid hybrid, described in the Gardeners' Chronicle, June 22, 1878, as "a beautiful flower of a rich royal purple colour, and splendid form. This variety belongs to the viticella type, and is remarkably richly coloured." First-class Certificate Royal Horticultural Society. Price 15s. each.

LILACINA FLORIBUNDA (T. Cripps & Son).—Pale grey-lilac, deeply veined; flowers the size of C. Jackmanni, but having six petals and of perfect shape. This is the lightest variety and most abundant bloomer in this section. An admirable contrast to C. Jackmanni for bedding purposes. Price 10s. 6d. each.

OTHELLO (T. Cripps & Son).—Flowers medium, a good shaped six-petalled variety. Late and very free flowering; colour dark velvety purple. Price 10s. 6d.

Discount to the Trade.

Plates of "Earl Beaconsfield" and "Ilacina grandiflora," 2s. 6d. each.

The Tunbridge Wells Nurseries, Kent.

Vines—Vines—Vines.

Also Planting Canes of several other varieties. CATALOGUE free. The Trade supplied.

Primulas—Primulas—Primulas. Eleventh Year of Distribution.

WILLIAMS' superb strain, 1s. 6d. per dozen, 10s. per 100; package and carriage free.

CINERARIAS, choicest assortment, same size and price. The above are quite equal to those I have sent out in previous years. Cash with order.

JOHN STEVENS, The Nurseries, Coventry.

Verbenas—50,000 Now Ready for Sale.

S. BIDE can now supply, as he has done on previous occasions, really good strong spring-struck Plants of Purple, Scarlet, White, and Pink VERBENAS, at 6s. per 100. Good Exhibition Varieties, 8s. per 100.

IRESINE LINDENI, 6s. per 100. HELIOTROPE, 6s. per 100. COLEUS VERSCHAFFELTII, 8s. per 100. MESEMBRYANTHEMUM CORDIFOLIUM VARIEGATA, 8s. per 100. Package free for cash with order.

Also strong healthy CUTTINGS of the above at half-price, free by post.

S. BIDE, Alma Nursery, Farnham, Surrey.

By Permission of the Hon. Board of Customs.

(Free of Duty.)

CORRY & SOPER'S NICOTINE SOAP

(PATENT.)

An effectual and speedy Eradicator of Scale, Thrips, Green Fly, Mealy Bug, Red Spider, American Blight, and all Parasites affecting Plants, without Injury to Foliage.

It may be used with perfect safety and efficiency for the Destruction of Gooseberry Caterpillars.

Especially adapted for the Destruction of Blight on the Coffee Plant.

The Proprietors have great pleasure in bringing to the notice of Horticulturists generally this valuable preparation, the basis of which is Nicotine, or the Oil of Tobacco, with which is blended other essential ingredients, to render it available as a general INSECTICIDE.

It has now undergone a thorough test by some of the most Practical Men in Horticulture, and it is proved beyond all doubt that no Insecticide will bear comparison to it for killing properties with PERFECT SAFETY TO FOLIAGE.

It may be used as a Dip or Wash for any description of Out or Indoor Plants, and as a Dressing for the Bark of Fruit Trees, Vines, &c., it has no equal.

Some hundreds of Testimonials lately received from men of considerable experience throughout the Kingdom.

Sold in Jars, 8 oz., price 1s. 6d.; 20 oz., price 3s.; and in Tins, 14 lb., price 15s. 6d.; and Drums, 28 lb., price 25s.; 56 lb., price 50s.; 112 lb., 95s. Full directions for use on each package.

And 2 ounce Sample Jars, 6d. each.

Full directions for use on each package.

Manufacturers of TOBACCO POWDER, TOBACCO JUICE (duty free), TOBACCO PAPER and CLOTH, and HORTICULTURAL SUNDRIESMEN.

May be obtained from all Seedsman and Florists.

Wholesale from the Manufacturers,

SHAD THAMES LONDON, S.E.

Bedding Plants, &c.—Notice.

WOOD and INGRAM beg to offer their very fine stock of Variegated, Zonal, and other Geraniums, Verbenas, Centaureas, Hollyhocks, Alternantheras, Calceolarias, Iresines, Lobelias, and all varieties of the most useful BEDDING PLANTS. Also the following, in 5-inch pots:—Pelargoniums, 2s. per dozen, 6s. per 100; Herbaceous Calceolarias, 3s. per dozen, 10s. per 100; Fuchsias, 4s. per dozen, 30s. per 100; Tree Carnations, in bulb, 12s. to 18s. per dozen, 8s. per 100. For prices of Bedding Plants see Special Trade Offer, which will be sent, free by post, on application. The Nurseries, Huntingdon, and St. Neots.

New Japanese Azalea.

AZALEA ROSE-FLORA.—This beautiful species, which is now offered for the first time, differs from every other Azalea in cultivation. The flowers in the bud resemble those of a miniature Tea Rose, whilst, as they expand they regularly imbricate like those of a Camellia. The qualities, combined with the fact that it does not fall off, render it invaluable for coat flowers, bouquets, as well as for exhibition and general decorative purposes. It is compact and free in growth, and much branched; colour deep rose-red.

First size, 6 inches high, some in flower, 10s. 6d.

Second size, 4 to 5 inches high, some in flower, 7s.

Third size, 1 foot high, many in flower, 31s. 6d.

WM. HUGH GOWER (Manager to the late Wm. Rolli son & Son), The Nurseries, Footing, S.W.

Illustrated Catalogue of Ferns.

W. AND J. BIRKENHEAD, Fern Nursery, Sale, near Manchester, beg to say that their CATALOGUE OF FERNS for 1880 is now ready, consisting of eighty-four pages, containing many Illustrations, Synonyms, Descriptions, and copious yet simple "Hints on Fern Cultivation," post-free for six penny stamps. Also, now ready, a "SPECIAL LIST OF FERNS," free on application.

To the Trade,

HOME-GROWN TURNIP SEEDS.

H. AND F. SHARPE invite the attention of the Trade to their fine selected Stocks of TURNIP SEEDS, which comprise, amongst others, the following excellent varieties, viz.:

- Sharpe's Improved Large Swede
Sutton's Mammoth Purple-top
Sharpe's West Norfolk Swede
Devonshire Grey Stone
Sutton's Champion Swede
Pomeranian White Globe
East Lothian Swede
Lincolnshire Red Round
Green-top Yellow Aberdeen
Stratton Green Round
Golden Yellow Aberdeen
White Stone or Scabbie

The quality is very fine, and the prices will be found very advantageous to purchasers. For further particulars apply to Seed Growing Establishment, Wisbech.

VIOLAS, 20,000 fine strong plants:—

cornuta, white } 5s. per 100, 45s. per 1000.

LOBELIA, Emperor William, strong autumn-struck, from stores, 2s. 6d. per 100, 20s. per 1000; from single pots, 5s. per 100, 45s. per 1000.

Cash only. Carriage and package free.

H. J. HARDY, Stour Valley Seed Grounds, Bures, Suff.ilk.

Mysotis elegantissima.

The new Silver-edged, blue-flowered Forget-me-not.

RODGER, McCLELLAND AND CO. are now sending out this superb Novelty for the Spring Garden. Good plants 3s. 6d. each, 36s. per dozen. Can be sent by post. 64, Hill Street, Newry.

MATRICARIA INODORA PLENA

(NEW DOUBLE MAY-WEED).

Figured in Gardeners' Chronicle of December 13, 1879.

Will bear the severest winter without protection. If grown in a rich border it will flower in the greatest profusion from June till October, and the flowers, which are pure white, are equal to those of a Pompon Chrysanthemum. It is invaluable for cutting. 1s. 6d. each, 12s. per dozen, 75s. per 100. Engraving sent with three plants. The usual discount to the Trade.—Messrs. DICKSONS AND CO., 1, Waterloo Place, Edinburgh.

BEDDING PLANTS, & C.

GERANIUMS, Bedding, Zonal and Nougay, in choice sorts, our selection, 2s. 6d. and 3s. per dozen, 16s. and 20s. per 100.

GERANIUMS, Bedding, Bicolor varieties, 3s., 3s. 6d., and 4s. per dozen.

choice, for pot culture in summer or winter, twelve fine varieties, 4s. and 6s.

Our collection is second to none, including the best sorts from all raisers, home or foreign.

AGERATUMS and LOBELIAS, strong, and well hardened off from stores, 1s. per dozen, 5s. per 100.

in pots, 2s. per dozen, 12s. per 100.

CALCEOLARIA, Golden Gem, 2s. per dozen.

DACTYLIS ELEGANTISSIMA, GOLDEN PYRETHRUM, SEDUMS of sorts, for Carpet Bedding, 1s. per dozen, 6s. per 100.

HELiotROPEs, COLEUS, TROPÆOLUMS, and SALVIA, fine named sorts, 2s. per dozen, 12s. per 100.

ANTIRRHINUMS, PHLOXES, PANSIES, and PINKS, fine named sorts, 3s. per dozen; 12 of each, 45 m. 11s.

ALTERNANTHERAS and IRESINES, of sorts, 2s. 6d. per dozen, 15s. per 100.

BEGONIAS, Tuberosus, in great variety, 4s., 6s., 9s., and 12s. per dozen.

CENTAUREA RAGUSINA, 3s. 6d. per dozen.

CHRYSANTHEMUMS and FUCHSIAS in variety, 2s. 6d. per dozen, 15s. per 100.

HERBACEOUS and ALPINE PLANTS, 12 in 12 sorts, 4s.; 50 in 50 sorts, 12s.

DELPHINIUM, fine sorts, to name, 6s. per dozen.

PANSIES and VIOLAS, for bedding, in great variety, 2s. per dozen, 12s. per 100.

PLANTS, Stove, in great variety, 6s., 9s., and 12s. per dozen, our selection.

Greenhouse, 6s., 9s., and 12s. per dozen, our selection.

FERNS, Stove or Greenhouse, 9s. and 12s. per dozen, our selection.

CATALOGUES post-free.

WM CLIBRAN AND SON, Oldfield Nursery, Aitrimham.

HELLEBORUS NIGER,

the Christmas Rose. This beautiful white flower, coming to perfection at Christmas time, is already much to be had, being hitherto too scarce and dear. Millions of its fine blossoms should be ready for the markets in mid-winter, where only hundreds are now to be found, and would always prove the most profitable thing it is possible to grow. It requires no heat nor care. We are prepared to supply for immediate orders any quantity of fine roots at one-sixth the usual price, and we believe that investment in them will prove the finest speculation possible. For terms apply to

HOOVER AND CO., Covent Garden, Lon-Lon, W.C.

**MESSRS. BECKWITH AND SON** are now sending out their GENERAL COLLECTION OF DECORATIVE PELARGONIUMS, in upwards of 100 varieties; most of which may be had either fully in, or just coming into bloom. Price, £5 per 100, delivered to any Terminals in London. No charge for packing. Tottenham Nursery, London.

**EVERY ONE LIKES A VERBENA.**

ALL who have not seen my magnificent strands of Phlox-like VERBENAS at the London Shows and wish to possess the finest varieties, deliciously fragrant (no comparison with those formerly seen), should order now. Fine plants, 4s. per dozen; 5s. sent for 14s., 10s. for 24s.

**H. CANNELL** begs to announce that his COCKSCOMBS, BALSAMS, and PEFUNIAS are now in small pots, and just ready for a shift into their blooming pots. All who wish to excel in these should order at once before they become pot-bound. 2s. per doz., 5s. for 10s. All of H. Cannel's best strains, and will be sure to give satisfaction.

**Paris Daisies (Marguerites).**  
**CHRYSANTHEMUM FRUTESCENS** (White), best bedder.  
**CHRYSANTHEMUM CORONARIUM ALBUM** (White), best for cut flowers.  
 " " **LUTEUM** (Yellow), best for cut flowers.  
 " " **ETOILE D'OR** (largest Yellow).  
 Post-free, 1s. each; price per dozen or 100 on application.

**Phloxes, Violas, and Cannas.**  
**H. CANNELL** has a large stock of the above, and of all the best varieties, and can supply them in large or small quantities.  
 The *Journal of Horticulture* says, "Violas at Swanley are magnificent, no other firm doing justice to the rich masses of colour."

**Zonal Pelargoniums.**  
 IT must be admitted that a Bedding and Winter-blooming Zonal superior to Master Christine is a pit to floriculture, and it is, therefore, with great pleasure I now offer **NEWLAND'S MARY**, which is certainly by far the best bedding Pink in cultivation.  
 Price 1s. each, 10s. per dozen.

**THE HOME FOR FLOWERS,**  
**S W A N L E Y, K E N T.**  
**D'ANIELS'** Unrivalled Strains of Choice FLORISTS' FLOWER SEEDS, post-free.

*In the rearing of Florists' Flowers from seed the first essential point is to secure carefully hybridised seed, saved from the finest flowers of the finest kinds, the chances of success in raising some really good varieties being vastly greater from a few plants from seed of the choicest quality, than from a large quantity raised from seed of an inferior description.*

# MASDEVALLIA ROSEA.

MR. J. C. STEVENS has received instructions from Mr. F. SANDER to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, May 31, at half-past 12 o'clock precisely, a fine lot of this splendid MASDEVALLIA, described in *Gardeners' Chronicle*, May 1. Professor Dr. Reichenbach says:—"What is Masdevallia rosea? some of our readers may ask. Well, it is a peculiar type of Masdevallia, quite distinct from any species we have, bearing flowers of a length of 11 centimetres. The even sepals are 3 centimetres broad, of a most lovely rich rose-purple, the long tube of an exquisite purple-scarlet. Dr. Lindley sketches it: 'Flowers pink, 2 inches long, very showy.' This glorious thing, so long desired, was saved from the wrecked ship, *Para*, at St. Michael's, Azores, by our friend F. C. Lehmann. The very few plants will appear at Mr. Stevens' Rooms, to make their European *début*. We hope to give soon further details and a woodcut of the Queen of Masdevallias. This Masdevallia is most difficult to import, and to Mr. Lehmann's energy and skill we owe that now it is alive in Europe."

The Sale will also contain a fine lot of ODONTOGLOSSUM ALEXANDRÆ LEHMANNI, O. VEXILLARIUM LEHMANNI, O. LUTEO-PURPUREUM, various DENDROBIUMS, CŒLOGYNES, ODONTOGLOTS, ONCIDIUMS, and other ORCHIDS.

*May be viewed the morning of Sale, and Catalogues had.*

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

## A MAGNIFICENT IMPORTATION OF

VANDA LOWII, splendid pieces, in excellent condition;  
 CYPRIPIEDIUM LOWII and STONEI, in strong masses;  
 CYPRIPIEDIUM HOOKERÆ, very fine;  
 CALANTHE, new species, with variegated leaves;  
 BOLBOPHYLLUM BECCARI, the finest plants ever imported;  
 CŒLOGYNE PANDURATA, very strong;

And many other fine kinds.

MR. J. C. STEVENS has received instructions from MESSRS. JAMES VEITCH & SONS to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, June 7, at half-past 12 o'clock precisely, by far the finest importation of the above, and other splendid kinds, which has ever reached this country from Borneo.

**ALL THE PLANTS ARE IN SPLENDID HEALTH.**

*May be viewed the morning of Sale, and Catalogues had.*

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN LONDON, W.C.

# CONSERVATORY, CHITT'S HILL HOUSE.

## EXTERIOR VIEW.

CONSERVATORY, CHITT'S HILL HOUSE, WOOD GREEN.—From the "Gardeners' Chronicle."

This handsome structure, which, by the aid of Photographs, we are able to illustrate, has been erected for S. PAGE, Esq., by J. WEEKS AND CO., of Chelsea, who have long occupied a prominent position amongst Horticultural Builders and Engineers. We are indebted to this firm for the opportunity of showing how greatly taste in designing such structures has improved. We look upon this as a model structure of its particular type. It is a structure which might be copied in a complete or modified form as an appendage to any good villa or small mansion, which it would most tastefully embellish, and, if somewhat amplified, might be made to adorn a more stately home. The interior, instead of having the centre occupied by stages for pot plants, or beds for planting out, is kept open for promenading. The angles are filled with tastefully selected groups of plants, and the roof furnished and festooned with choice creepers, while the front part is provided with a low stage, next the upright sashes, for choice flowering plants. Basket plants are suspended here and there from the roof, and specimen Palms, Tree Ferns, and other effective subjects set in appropriate positions, so that one might walk in and out amongst or beneath them; while there is still maintained that luxurious breadth and freedom, which under such circumstances is so enjoyable.

*Our NEW BOOK of DESIGNS (15th enlarged edition), the most complete of its kind ever published, sent Post Free on application.*

THE  
**Gardeners' Chronicle.**

SATURDAY, MAY 29, 1880.

LOUGHTON.

LAST year, when autumn was lighting with a bronzy hue the foliage of the Beech trees in Epping Forest, and lengthening shadows announced the close of an all too short day, the hope was framed that, sooner or later, the time would come when a second visit might be paid to the Forest and to the nurseries therein contained. And now the time has come. The tender young green of the feathery Hornbeams, the translucent shade of the Beech trees, are scarcely if any less lovely than were the autumn tints. Can anything be more beautiful than the varied hues of green?—grass-green and emerald-green in the pastures, greenish-yellow in the young Oaks and Hornbeams, black-green in the Hollies, and all backed up, when we saw them, with rich purple clouds threatening the rain which did not come. The near view comprised innumerable pollards—Oak, Beech, Hornbeam—no two alike, but all grotesque and fantastic, and now capped with a head-gear of loveliness, contrasting strongly with the dark Hollies. The undergrowth is carpeted with yellow prickly Genista (*G. anglica*), with pink Pedicularis, with white Milkwort (*Polygala vulgaris*) (why all white?), with the Butcher's Broom (*Ruscus*), with the tiny *Montia fontana*, with *Polytrichum* and *Sphagnum*, and with a Scotch Cryptogam, pointed out last autumn by sympathising eyes, and mentioned now again; because, far from being limited to the one spot where friendly eyes pointed it out, it may be found spreading amid the grass in many places. But we are not going to tell its name and address to the profane. We will whisper them to the free and accepted botanist, the man who can look and respect, but to the ruthless destroyer—never. Suffice it to say that it is a real joy to find it scattered, not sparingly, in many places, albeit it finds no place in any recent local flora. Threading our way carefully through and between the endless rows of dwarfed trees that reminded us of so many grotesque gnomes, treading warily where *Sphagnum* and *Drosera* revealed the unsubstantial bog, we came across occasional traces of civilisation in the form of orange-peel, and the hard shell of the Cocoa-nut—even broken bottles were not absent. Ah! what a change from the time when Boadicea marshalled her plucky body-guard within the compass of this old encampment within whose still visible encircling bank we stood. Orange-peel, cocoa-nut-shell, and specially broken glass, are not quite what we like to see in the Forest, but think of that queen, brave as she was, a mere savage, and remember what a change for the better the orange-peel and the other etceteras represent. Think of the Roman legions who found her so tough an antagonist. They knew and could know no Oranges out of Italy, no Cocoa-nut ever tempted their appetites or induced a trial of hand and eye—glass had they, but the foam of Bass, the sparkle of Alsopp, were to them un-

known. Still threading our way, arms outstretched and head bent down, to escape, if haply we might, the Briers, we emerged into a green glade, and there on the grass found a family party—some East-end artisan—his helpmeet and their children around him all dressed in Sunday best. There was the secret of the orange-peel and the Cocoa-nut. We had traced them to their source. The mind is almost incapable of filling in the vast changeful interval between Boadicea and an East-end artisan. Stay! the one connecting touch of Nature is not absent—it never is. The boy of the party, so soon as his mouth was sufficiently freed from the pleasing exercise of satiating hunger, whooped at intervals a loud "ooray," for no conceivable reason that we could find, save the mere joyousness of his heart and the pleasure of being among the trees, and the birds, and the flowers, so different from the sights and scenes to which he was accustomed. The mother affected to restrain him, but it was clear to see that her sympathies were in full accord with those of her boy, and it was only matronly dignity which impelled her to remain silent. It was a sight to do the heart of a Lord Mayor good; it was a sight to touch even the sensibilities of the irrepressible "Monckton." However, so far as we are concerned, it was only an incident in the day's work, and had as much to do with horticulture as Boadicea herself.

Should any one want to find the camp aforesaid it will not do to trust to local guides; an old peasant searching for a wandering calf, not yet provided, Swiss fashion, with a bell like its dam, and who had lived all his life close to the camp, as it turned out, had never "heard talk of it;" another suggested the rifle butts near High Beech as the desired spot. Suffice it to say it is on the Epping side, and within half a mile of the "Robin Hood" inn, in the heart of the wood, and is, after all, not so difficult to find to those who know how to look.

Here and there are other traces of man's hands, in the form of ugly gashes, which ultimately will develop into roads, drives, and avenues, but which now are hideous scars. Along these roads we may hope anon to have fine avenues of noble trees, and on bluffs and in clearances we may look for clusters of trees and shrubs, which shall yield colour to diversify what must in full summer-tide be monotonously green. There is plenty of room for judicious planting and wild gardening of this sort without interfering in the least with the natural wildness of the Forest. The pollards are fantastic and grotesque, but a forest all pollards needs a large admixture of healthy uncrippled trees. You have only to experience the pleasure that is felt when the eye rests on the Beech trees at High Beech, or the Oaks near Chingford, to see how great is the charm of looking at well-grown trees after inspecting a whole army of cripples.

This is a rather long introduction to the main object of our visit—the nursery of Messrs. W. Paul & Son at Loughton—but there is ample excuse for it—the beauty of the forest, the friendly cuckoo, the sweet, full-toned nightingale: in and among these is the nursery situate, and did not its proprietor descant not long since, learnedly and judiciously, as he might be expected to do, on the proper treatment of the Forest in the future? and was it not a duty to verify his conclusions on the spot? Of course, as might be expected, we retained our own opinion that Mr. Paul, as it seemed to us when we read his paper and seems to us now, in his laudably careful reticence rather undervalued the aid which the planter—the judicious planter—and no other should be allowed to set foot in the Forest—may render in enhancing its many beauties. A judicious planter, and one with a love of his art, and of the materials with which he has to deal,

and with a knowledge of the conditions he has to fulfil, will never make the fatal mistake of turning a forest into a pleasure garden.

The nursery is an annexe to the better known one at Waltham, the home of Roses and Conifers, of Camellias and ornamental trees. It is the store-room, the nursery in fact, where one does not expect the symmetry and neatness of the drawing-room, but which for that very reason is more attractive to the initiated. One does not always want to see plants on parade; it is more instructive to see them as it were behind the scenes. It will be judged from what has been said that the contents of this nursery are what might be expected from a firm with a well-earned reputation for ornamental trees and shrubs. Roses, another speciality of Mr. W. Paul, are not grown here—the visitor must betake himself to Waltham for these; but if he wants to see well-grown Hollies and golden Yews, he might do much worse than go to Loughton. Among the Hollies, specially good here, we noted the varieties Hodginsii, Shepherdi, maderensis, Golden Queen, Waterer's Dwarf worked on the common Holly as a standard, and making fine compact heads; donningtonensis, the very dis-

Skimmias japonica and oblata—the latter one of the best dwarf evergreens, and the Osmanthus have passed the ordeal safely, while the Raphiolepis is badly hit.

The Handsworth Box may be mentioned for its hardiness, its fine habit, and the rich red colour often assumed by its foliage.

We have not space to mention more of the contents of this nursery, but enough has been said to justify the decision of the arbitrator in retaining this enclosure on the condition that the public have free access to this as to the other parts of the Forest. The interest of such a nursery and its special value as an experimental ground are too obvious to need further comment. *The Rambler.*

## New Garden Plants.

BRASSIA (GLUMACEÆ) EUODES.\*

This belongs to the small but difficult group of *Brassia glumacea*, and looks very like it. The flowers have the ends of the sepals and petals of a neat yellow, or yellowish colour; the column is marbled with purple, and the upper part of it in front is purple; lip yellowish. All the sepals and petals, except the tips, brownish-red. This colour may be the last state, as is observable in various *Brassias*. I am unable to say whether the flowers were distinctly coloured earlier. They have a beautiful smell, whence the

FIG. 117.—FLOWER OF MASDEVALLIA ROSEA NAT. SIZE. (SEE P. 681.)

tinget *I. opaca*, and many others. The Cheshunt Yew may be noted for its close pyramidal habit, and grown as it is here, in association with the golden Yew, is very striking and effective.

Rhododendrons and American plants generally are grown in considerable quantities. An avenue now in course of construction, and lined with specimen plants of the best named varieties, already shows the kind of effect that the growth of another season or two will produce. Some people fancy that Rhododendrons will not grow kindly on stiff clay, but a visit to this nursery will undeceive them. It is fair to say, however, that cocoa-nut fibre refuse is used in considerable quantities to lighten the soil. A fine piece of *Andromeda floribunda* may be mentioned in this connection. Conifers, or some of them, do well here; the Deodar Cedar in great beauty and quite unhurt by frost; the sturdy *Abies Nordmanniana*, the stately *Libocedrus decurrens*, *Juniperus virginiana glauca*, *Abies nobilis*, *Cupressus Lawsoniana*, *Thuopsis dolabrata*, exceptionally fine; *Cryptomeria elegans*, rich in colour and wholly unhurt by the winter; *Cupressus macrocarpa*, on the other hand, has suffered severely, as have *Laurustinus*, *Arbutus*, *Japan Euonymus*, and common Laurels. On the other hand, the varieties *caucasica* and *ovata* are not in the least affected, a circumstance which the intending planter will take note of. *Ligustrum coriaceum*, *Berberis Darwinii* and *stenophylla*, the

name is given. Mr. Backhouse, Holgate House, York, imported from New Granada this species—which is quite distinct in the keels of the lip—and was so very kind as to send a whole plant (with four other well-grown species), most successfully packed against frost, to assist me in understanding its features. Many thanks for such unusual kindness. *H. G. Rehb. f.*

CYPRIPEDIUM PETRI, *Rehb. f., n. sp. †*

This is very near Mr. Day's *Cypridium*, yet fresh materials just at hand confirm the first impression, which I wrote in February last to Mr. Harry Veitch, that it must be regarded as distinct. Its leaves have a darker ground colour and just those far darker, square green paintings, which are so characteristic in the affinity. The whole flower is smaller, shorter. Sepals white with green veins, very distinct in outline, much shorter than in the species I first dedicated to my most assiduous correspondent. Petals light brownish, green at the base, ligulate acute, straight or cuneate, acuminate, covered on the whole border with long hairs, just as in *Cypridium Dayanum*. Lip greenish-brown, with dark sepia-brown on the front part of

\* *Brassia (Glumaceæ) euodes*—Folius oblongo-ligulatis acutis pseudobulbis parvis prope triangulos acipites anthesi omnino involventibus; pedunculo folia supra subaequante racemose pauciflora; bracteis spatulatis ovaria pedicellata non omnino æquantibus; sepalis linearibus acuminatis; tepalis subæqualibus minoribus; labello oblongo apice abrupte aristato; carinis baseos semiblongis supra medium abrupte angulatis, puberulis; lineis incrassatis antepositis, totis carinis cum basi labelli geniflexi in basin columnæ impressis.—*On idum euodes*. Neo Granada. Imp. cl. Backhouse. *H. G. Rehb. f.*

† *Cypridium Petri*, n. sp.—Aff. *Cypridium Dayanum*: labelli sacco magis conico, sepalis brevioribus, sepalo impari triangulo acuto, sepalo inferiori ligulato acuto triangulo; labello subduplo breviori; tepalis brevioribus rectis seu acuminatis; staminodio subrhombico. *H. G. Rehb. f.*

the disc, or totally of that colour, yet always, it would appear, with green angles. Warts on the border of involved base nearly purple. Stamens light green with some dark green veins. If there were not several other marks of distinction (in addition to the totally distinct colour of the flowers) it would be well distinguishable by the relative length of the sepals and petals.

This is a discovery of Messrs. Peter Veitch and F. W. Burbidge, made in the Malayan Archipelago. It only bears the name of one of those gentlemen. *H. G. Rehb. f.*

#### MASDEVALLIA NANTHINA, n. sp.\*

This is a rather pretty *Masdevallia*, with bright yellow flowers and some dark violet at the very base of even sepals, which are a little narrower than the odd one. Small petals whitish. Lip yellowish, with a dark knob at the apex. It has been believed in England to be *Masdevallia Wageneriana*, Lindl. No doubt there is a certain similarity between the two, but this suggestion is founded on a mistake. That species is

#### MASDEVALLIA ROSEA.

OUR illustrations, figs. 117, 118, taken from a sketch by M. Lehmann, represent this lovely *Masdevallia*, which, though old in one sense, may yet be described as new. The history of the plant has more than once been given in our columns by Professor Reichenbach (see p. 648). Suffice it now to say that it resembles a rose-coloured *M. Harryana*.

#### A HAMPSHIRE GARDEN.

ABOUT 4 miles from Romsey and 8 from Southampton, on the borders of the New Forest, pleasantly situated in a park of some 400 acres, lies Paultons House, the seat of H. Sloane-Stanley, Esq. The gardens are commodiously and conveniently situated at the western side of the park. An occasional visit to

FIG. 118.—MASDEVALLIA ROSEA: MUCH REDUCED. FLOWERS ROSE-PINK.

really well represented in *Bot. Mag.*, 4921, which shows the best feature, the triangular nicely tooth-letted blade of the lip, while our plant has a nearly square, entire blade. The figure in Paxton's *Flower Garden*, iii., p. 74, is a very indifferent one, almost good for nothing, giving the impression of the flower being shut. I have to thank for this the Messrs. Veitch, of Chelsea. *H. G. Rehb. f.*

MANCHESTER WHIT-WEEK SHOW.—During the seven days on which this show was open to the public, we learn that it was visited by nearly 60,000 persons. It has consequently been a very successful enterprise.

\* *Masdevallia xanthina*.—Aff. *M. Wageneriana*: folio a petiolarum basi cuneato-oblongo obtusissime acutiusculo; floribus sepalis omnino expansis; sepalis impari ligulato oblongo gateato in caudam longiorem extenso, sepalis paribus paulo angustioribus, omnibus sub-caudis retusiusculis, antico carinatis, basi angulatis; labelli ungue ante laminam utrinque constricto; lamina cuneato-oblonga retusa medio apiculata trinervi; columna apice tridentata. Subduplo major quam *Masdevallia Wageneriana*. *H. G. Rehb. f.*

our neighbour's or friend's garden not only extend our personal acquaintances or unites them more closely, it does more. It often extends our knowledge and brings us into contact with features which may shadow forth ideas which, if not useful at the present time, may be of the utmost importance hereafter if properly turned to account. I was struck with many features at Paultons during a recent visit, not the least of which was the beautiful undulating surfaces which gradually ascend and descend into hill and dale by slow gradients so as not to render the landscape abrupt at any given point. The park is moderately wooded with groups of trees, and single specimens are tastefully dotted about. There is a lake which is fed from two sources in the forest a short distance from the house, and here I must begin with my few practical notes.

I observe the lake takes a gentle sweep past the house, and this seems to have been the key to all the planting operations in the pleasure grounds, as, indeed, in every other part of the garden. Every-

thing is arranged in the free-and-easy style, an irregular belt of shrubby border here, a group of trees there. There are no abrupt twists and turns, and yet the visitor meets with an occasional unexpected treat in rounding a curve where are a medley group of hardy plants in a secluded nook or mayhap a narrow border of spring flowering plants, the ingress to which is by a narrow footpath dividing two shrubby plantations and having communication with two sides of the grounds.

Paultons cannot be said to be noteworthy for specialities, but the visitor may note many things pregnant with instruction, both in regard to varied tone and character, that may be enjoyed in a moderate sized garden, as well as many practical hints upon the treatment of plants that are too frequently seen in very indifferent condition through over-coddling. On a lawn near the house is a huge Cedar of Lebanon, the branches of which are said to cover an area of over 80 yards in circumference. The chain of shrubby borders and beds which margin the lake side are good practical examples of taste and skill in formation and planting. Fine plants of *Arundo Donax* and *A. conspicua* find an appropriate home here, and *Magnolias* just opening their flowers are accorded suitable situations, where their beauty can be enjoyed to the full. Not the least interesting feature in this part of the grounds is a small alpine rockery and several beds of hardy Heaths, of which *Erica codonodes* is one of the most useful for purposes of cutting.

The flower garden (a small one) is of simple design, and its close proximity to the simple rockery and single beds of hardy plants proves that "where there's a will there's a way," and that no branch of gardening need be sacrificed for the sake of another, while there is room for all.

Proceeding from this point to the fruit garden, I jotted down the names of several varieties of Pears and Apples out of a fine collection of standard trained trees, which were in full blossom at the time of my visit, and which promised (weather permitting) to bear a fair crop of fruit. The Pears are *Burré Diel*, *Fondante d'Automne*, *Duchesse d'Angoulême*, *Burré Clairgeau*, and *Burré Superfin*. Apples: *Stirling Castle*, *Lord Suffield*, *Packhorse Pippin*, *Mannington's Pearmain*, *New Hawthornden*, *Gravenstein*, *Fearn's Pippin*, *Beauty of Kent*, *Dutch Mignonne*, *Ecklinville Pippin*, and *Tower of Glamis*. The trees are planted upon mounds of earth slightly raised above the natural ground-level, in consequence of the situation being damp in wet seasons, and are heavily mulched, in order to encourage root extension near to the surface. I am bound, however, to admit that here, as elsewhere, the old-fashioned trees that have been taking care of themselves up among the skylarks and swallows are best clad with blossoms, and promise to yield by far the largest supply of fruit.

There are two fruit and kitchen gardens at Paultons, each 2½ acres in extent. One garden is entirely walled in, and the second partly so, and both are in perfect order and skilfully and abundantly cropped. The glass structures are well stocked with fruit trees and plants in their respective departments. Early crops of Strawberries have been very good, and Peaches promise to be of the same excellence. A house of young Muscat Vines planted in the spring of 1878, which produced a crop last year, are really good examples of Vine culture, but it is of a house of Vines planted in an outside border in the month of June, 1878, and lifted in November last year (1879) that Mr. Todd, the head gardener, has most reason to be proud. The Vines in question were lifted through an alteration being made in the garden, and replanted in an inside border "without shortening back the canes;" and the Vines have not only broken regularly this year from the top to the bottom of the house, but are also carrying a nice crop of fruit—a fact which proves the skill with which the operation of lifting and replanting the Vines was carried out, as also the subsequent treatment. In one of the vineries I noticed several grand pots of the old *Amaryllis sulcata*, and in some of the plant-houses are certain plants which are not to be met with in every garden.

Those that appeared to me to be most useful were *Grevillea rosmarinifolia*, the flowers of which resemble a *Clianthus*; *Eriostemons* in two or more varieties; *Diosma capitata*, an old-fashioned sweet-scented plant that was more in vogue a dozen years ago than it is now; *Andromeda pulverulenta*, bearing white cup-shaped flowers after the form of those of *Kalmia latifolia*;

and several useful Acacias, and other New Holland plants.

Perhaps the most striking example of the hardness of many greenhouse plants is that of a fine specimen of *Trachelospermum* (*Rhynchospermum*) *jasminoides* and an *Erica Cavendishiana* being wintered in an unheated pit, and only covered with mats or litter all through the past winter, and the former especially was in vigorous health. Mr. Todd seems to grow many plants in cold frames better than they are often seen under more expensive treatment. *Visitor*.

### ELECTRO-HORTICULTURAL DIALOGUE.

I HAVE read with much interest the accounts, which have recently appeared in the Press, of the experiments in electro-horticulture, conducted by Dr. Siemens and others. On several occasions I have conversed with gardeners on the subject, and have been much surprised by their apparent indifference and almost hostility to the introduction of what seems to me to be a new and valuable aid to production. My own gardener, who is a fair and intelligent specimen of his class, seems to be particularly opposed to its introduction into my hothouses. The cause of this opposition I was, for some time, at a loss to determine; but a few days since I quite accidentally became acquainted with his reasons. One morning, in the course of my usual walk around the grounds, I entered my plant-house and sat down to read the morning paper, as is my custom. I had not long been there when my gardener, accompanied by a gentleman (whom I afterwards learnt was an engineer desirous of viewing the hothouses), entered the adjoining compartment, and the door of communication being open, I could not avoid hearing the following conversation, which I give as nearly as I can remember its details.

*Engineer*. Why do not you persuade your employer to take up the matter of electro-horticulture, and have this range fitted up with apparatus for electric lighting?

*Gardener*. Why, you see sir, the view I take of the matter is this: At present I am a very successful grower. I understand what I am about, and I give my employer satisfaction; but if he were to adopt this new-fangled plan of growing by the electric light, he would expect much larger results, which perhaps I should fail in producing.

*Engineer*. But surely, my dear sir, the fear of failure is a very weak reason why one should abstain from trying to obtain desirable results. If all the world were to be actuated by such a principle, progress and invention would be at an end, and art, science, agriculture, and horticulture would remain stationary. Again, the results in this case are not doubtful; for the fact that great advantages accrue from the use of the electric light has been incontrovertibly demonstrated. It has been clearly shown that the leaves are greener, the fruit finer, more quickly ripened, and that instead of only one crop (often a poor one), two, or even a succession of crops, may probably be obtained in a year. Again, the electric light will enable the gardener to have production more under his control, and to remedy the want of sufficient sunlight in winter weather.

*Gardener*. Well, you see, sir, I should be meddling with what I don't understand, and—

*Engineer*. But the whole thing is extremely simple, readily learnt, and easily managed by a person of ordinary capacity. Gardening has, as yet, been too much conducted on rule of thumb principles on old-fashioned lines; but now a grand opening is presented for improvement—a great opportunity for the gardener to elevate himself into a scientific horticulturist.

*Gardener*. But why should I put myself to all this trouble and bother? The introduction of this system here would entail a large amount of extra trouble and anxiety upon me, for which, as far as I can see, I should obtain no corresponding personal advantage.

*Engineer*. That I think is hardly the way to look at it. Do you take no pride in your business? Are you indifferent as to whether you excel in it or not? Are you content to stand still while the age progresses—to be behind the age in which you live—to remain stationary while more enterprising spirits pass you and leave you behind? This new discovery is, in all probability, destined to revolutionise horticulture. Its general adoption is only a question of time. Do

you then intend to let prejudice or indifference prevent you from adopting it until force of circumstances compels you to regret your inactivity, or will you become a pioneer in the good work?

*Gardener*. But consider the expense.

*Engineer*. That is trifling after the first outlay; besides, an outlay should always be considered with reference to the results obtained. In this instance the results would constitute first-rate interest on the amount expended; for, instead of only one crop in a year, you would be able to produce two. Then the first cost is not so large as you might imagine, especially when, as in your case, there is already steam-power on the estate. Many gentlemen have steam-engines at their farms, and these are often within available distance from the gardens, so that wires could readily be laid down. This new use for steam-power will doubtless cause many gentlemen who do not already possess it to consider whether it will not be worth their while to purchase an engine. Again, who knows but that some of our horticultural engineers may not shortly hit upon a scheme for obtaining both light and heat from the same source?

*Gardener*. But, sir, plants require rest; they cannot go on growing night and day without rest.

*Engineer*. True; but it is quite easy to give them rest when they want it, or to have a supply of recruits to take the place of exhausted plants.

From the above conversation it seems to me that the principal reason of opposition to electro-horticulture is the fear that it may entail a little extra trouble, and a certain sluggishness in adopting new inventions, which is perhaps a characteristic of the English race. However, in spite of opposition, I think of adopting it, and may perhaps on some future occasion trouble you with an account of the result. *Electro-Fideliis*. [We think the average gardener is at present justified in waiting the result of experiments carried out on commercial principles. At present it is only a scientific experiment, but decidedly a most promising one. EDS.]

### SPONDIAS OF JAMAICA.

THERE are found in Jamaica only four species of this genus, three of which are said to be native, and one introduced. The former are *S. lutea*, *purpurea*, and *gravecolens*, the latter *Spondias dulcis*, introduced from the Society Islands to the old Botanic Garden at Bath, from whence it has spread to many parts of the island, notably on the north side, where it has obtained the name of Jew Plum, and is also spoken of (erroneously) as the Mangosteen by many to whom the fruit correctly bearing that name is unknown. It being an introduced plant, has undoubtedly led to its exclusion from the latest *Flora of the West Indies*, and it is mentioned by Macfadyen in his earlier publication in a short note only. The best of the genus here represented, it grows to a height of 15 to 20 feet, and fruits abundantly, producing its flowers in axillary and terminal panicle racemes 1 foot in length, just before the young foliage commences to make its appearance in March or April, ripening its fruit in October and November. It is much more esteemed as a fruit than any of the other species, and produces drupes of obovoid form, of a light yellowish-green colour, and about 2 inches in diameter, having a delicious sub-acid flavour and a fine aroma. It is a tree deserving of more extended cultivation, and needs only to become better known to be eagerly sought after.

*Spondias lutea* and *purpurea* are trees very similar in habit and appearance to each other, and although separated by Macfadyen, are made synonyms by Grisebach. *Lutea*, however, has flowers which, although bearing many characters in common with *purpurea*, are of a different colour, being of a rosy tint, and much larger, while those of *purpurea* are of a bright red, the petals of *lutea* being 3" long, those of *purpurea* 2" only. The fruit of *lutea* differs also in being of a yellow colour, that of *purpurea* red, the first flowers three or four months later than the other, and is found at higher altitudes. They are both cultivated and sold in large quantities in the native markets, but require the palate to be "educated" to have their peculiar flavour appreciated by Europeans. Without knowing the tree producing each, the fruit of *Spondias gravecolens* is much more likely to be mistaken for *lutea* than *purpurea*, but differs from both in the tree reaching the height of 30 or 40 feet, the stem being covered with large corky excrescences and large spines or prickles. It has panicle racemes a foot or more in length, and bears fruit which, as the common name (Hog-plum) denotes, are sought after by hogs, but are of no value for any other purpose. The tree affords

a fine shade, and as it grows easily from cuttings of the limbs (as do all the species) is much planted for making permanent fence posts, as well as affording shade in dry pastures—two qualities which make it of peculiar value to the grazier, or more locally "pen-keeper," of Jamaica. *J. Hart, King's House, Kingston, Jamaica, April, 1880.*

### COLONIAL BOTANIC GARDENS.

(Extracts from Mr. Dyer's lecture, continued from p. 650.)

WEST INDIES.—With regard to the West Indies, I find with regret that the space at my command is wholly insufficient to more than touch on a few of the matters connected with their botanical interests, on which I had had it in my mind to speak. If these afford any fair ground for prediction, I should certainly draw the conclusion from the facts within my knowledge, that we are now at a new point of departure in the commercial development of these productive possessions of the Crown, which have long seemed lulled in a somewhat depressing lethargy. Of Jamaica, especially, we have high expectations. The present Governor, Sir Anthony Musgrave, has reorganised the botanical department, to which Sir John Grant gave so great an impulse. We have selected a gentleman to be placed at the head of it, to whom I have more than once alluded, and who has in many ways given proof of his capacity; and we further succeeded in obtaining for it the services of one of the ablest members of the English gardening class. *Cinchona* planting is now something more than an assured success. Tobacco, the cultivation of which was started by Sir John Grant, with the assistance of Kew, but languished under Sir William Grey, to be again vigorously supported by the present Governor, is now at least a successful experiment. "In the Hamburg market, the most considerable in the world for Tobacco," Jamaica "produce stood next in rank to Havana Tobacco, to which it was pronounced inferior, but superior to all other kinds, even not excepting those other parts of Cuba, such as St. Jago, Manzanillo, Vara, &c., which furnish such a very considerable quantity to the consumption at home." In 1869, 800 Tea plants were sent to Jamaica from Kew, and these have succeeded admirably; there can be no obstacle, except that of obtaining labour, why this cultivation should not be vigorously developed. The trade with the United States in fruit (including the Mangosteen, sent from Kew), whether fresh or dried, and the extension of the growth of Coffee, Cacao, and minor products, such as nutmegs (also introduced from Kew), are obvious sources of prosperity, merely waiting for development. Besides these, there is plenty of room for experimental cultivation. Ground nuts, which produce much of the oil consumed in Europe as that of the Olive, need but the simplest cultivation, and as yet have scarcely been tried. And I am assured that "gram," one of the most useful pulses of India, and largely used even in Southern Europe, is absolutely unknown in Jamaica. There is, it will be seen, plenty of scope for botanical enterprise in the island, and it is not the fault of natural endowments if it does not eventually become the Ceylon of the New World. At any rate, I hope that the Jamaica botanical department will take the lead among all similar institutions in the West Indies.

Nor can it be well doubted that there is a great future in store for British Honduras. At present the botanical service has no representative in the colony. The greater part of the interior has scarcely been explored, and it is doubtful whether it is even inhabited. "There seems to be no tropical product to which the climate and soil are not adapted."

In Dominica there is no botanic garden, but Dr. Imray, a resident physician, and a very old correspondent of Kew, has voluntarily carried on the work. Through his instrumentality we have introduced Liberian Coffee into the island, and a variety of other tropical plants, and have received many choice and interesting things in exchange.

In the Bahamas all the support of Kew has been given to the energetic attempts of the present Governor, Mr. Robinson, to start and encourage fresh industries. The cultivation of Cocoa-nuts, Tomatos, Tobacco, and Lemons are all new. The development of the trade in Tomatos is something extraordinary, having increased from two crates in 1875 to upwards of 8000 in 1879. We have done

our best to help Governor Robinson, and, as we generally find to be the case, he has not neglected to help us. The natural vegetation of the West Indian Islands is still most imperfectly known, and suggests some considerations at this moment of much scientific interest. Mr. Robinson has enlisted an excellent collector in our cause, and has even been able from a very restricted exchequer to find him some remuneration. This is a very different spirit to that of one of our consuls in Haiti, who, on my applying to him for information about one of the ordeal poisons of that island—these being matters of great physiological importance at this moment—assured me that he had it on good authority that "all the flora of South America, the islands included, are now cultivated in England."

In Trinidad there is an excellent botanic garden, most efficiently managed by Mr. Prestoe. I must content myself with saying that from no one do we get more valuable cases of plants more admirably packed. To Mr. Prestoe belongs the distinction of having, in 1877, first ripened the Mangosteen in the West Indies.

#### GUIANA.

I must conclude my rapid review of this part of the world by mentioning British Guiana, where what bids fair to be a fine botanic garden is now being laid out under the management of Mr. Jenman, who has been transferred to its charge from that in Jamaica. But Demerara at present has little interest except for sugar. The timber of its interior forests has been somewhat heedlessly felled in accessible districts, and yet, as I have stated before in this paper, we are to this day destitute of any botanical knowledge about the best kinds. The trade in Gum Balata, the trees producing which are abundant on the Berbice River, has dwindled away (the export in 1876 only amounted to nine casks), though it is more valuable even than gutta-percha, since it has not the disadvantage of that substance of becoming resinoid and brittle with age.

"Coffee was for a length of time almost the sole staple of Berbice and Demerara;" now not sufficient is produced to supply the demand of the colony. Demerara has, in fact, absorbed all its energies in a single industry, and at present practically stands to sink or fall by that. The example of Ceylon might be taken to show that such a course is not without its risks, and it is much to be hoped that when the new botanic garden gets fairly into working order, other vegetable products will obtain attention.

(To be continued.)

## A SYNOPSIS OF THE SPECIES AND FORMS OF EPIMEDIUM.

(Continued from p. 62.)

4. *E. concinnum*, Vatte, in Regel, *Gartenflora*, vol. xxi. (1872), p. 165, tab. 726.—Fully-developed leaf  $\frac{1}{2}$  foot long, consisting of two pairs of three leaflets each (six leaflets in all), which are cordate-ovate,  $1\frac{1}{2}$ —2 inches long, the end ones with a short open basal sinus, the side ones of the triads very oblique. Peduncle few-flowered, springing from the petiole about an inch above its top, the inflorescence a short simple raceme; bracts minute, lanceolate; pedicels about  $\frac{1}{2}$  inch long. Expanded flower  $\frac{3}{4}$  inch in diameter; outer sepals oblong, grey,  $\frac{1}{4}$  inch long; inner sepals oblong-lanceolate, purple,  $\frac{1}{2}$  inch long, ascending in the fully-expanded flower; petals with an orbicular erect claret-purple lamina  $\frac{1}{4}$  inch long and broad, and a short incurved concolorous claret-purple spur. Stamens and style falling short of the central cup formed by the petals.

A native of Japan. Rare in cultivation, and as a species scarcely worth separating from *E. Musschianum*, with which it quite agrees in the structure of the flower. Our single plant of it at Kew was received under the name of *E. Musschianum violaceum*.

5. *E. Musschianum*, Morren and Decaisne in *Ann. Sc. Nat.*, ser. 2, vol. ii., p. 353; Graham, in *Bot. Mag.*, tab. 3745.—Fully developed leaf about  $\frac{1}{2}$  foot long, biternate, the (nine) leaflets cordate-ovate, 2—3 inches long, thin in texture, not lasting through the winter, the end ones with a shallow basal sinus, the side ones very oblique. Peduncle few-flowered, springing from the petiole about 1 inch below its apex, the inflorescence a simple close short raceme, the bracts minute, lanceolate, brownish, deciduous, the erecto-patent, cernuous, nearly naked pedicels  $\frac{1}{4}$ — $\frac{1}{2}$  inch long. Fully-expanded flower about  $\frac{1}{2}$  inch in diameter; outer sepals oblong, very convex on the back, very deciduous, reddish-brown, with a pale border; inner sepals white, ovate-acute,  $\frac{1}{2}$ — $\frac{1}{4}$  inch long, ascending; petals with a white orbicular

entire lamina  $\frac{1}{4}$ — $\frac{1}{2}$  inch long and broad, and a short spreading spur. Stamens and style falling short of the lamina of the petals.

A native of Japan, introduced into English gardens in 1838, at which date it was figured and fully described by Dr. Graham in the *Botanical Magazine*. It occurs in most collections, but is one of the least showy forms in the genus. *E. niveum* and *diphyllum majus* are garden names of this species. It sometimes bears a smaller second raceme out of the axis of the peduncle of the main one, where the latter joins the petiole.

6. *E. macranthum*, Morren and Dene. in *Ann. Sc. Nat.*, ser. 2, vol. ii., p. 352, tab. 13; Lindl. *Bot. Reg.*, t. 1906; Paxton, *Mag.*, vol. v., p. 151, with a figure.—Fully-developed leaf reaching 1 foot in length, biternate; the nine leaflets cordate-ovate, 2—3 inches long, closely ciliato-dentate, not firm enough in texture to last through the winter, the end ones of the triads with rounded basal lobes  $\frac{1}{4}$ — $\frac{1}{2}$  inch long, the side ones very oblique. Peduncle arising from the petiole 1—2 inches below its apex. Raceme short, close, 6—10 flowered; the ascending pedicels densely pilose, the lower usually compound; bracts minute, oblong or lanceolate, scarioso. Fully-expanded flower  $1\frac{1}{4}$ — $1\frac{1}{2}$  inch in diameter; outer sepals oblong, deciduous,  $\frac{1}{4}$  inch long; inner sepals ovate-lanceolate,  $\frac{3}{4}$ — $1$  inch long, white with a slight violet tinge, reflexed when the flower is fully expanded; petals also white with a violet tinge, with an orbicular entire lamina  $\frac{1}{4}$ — $\frac{1}{2}$  inch long and broad, and a cylindrical concolorous, spreading or rather deflexed, spur, which is often half as long again as its subtending inner sepal. Stamens and style not protruding out of the petal-cup.

This is the finest of the Japanese species. It was introduced into European gardens about 1830, and is well known to every one who takes any interest in the genus. In the *So Mokou Zousetsu*, a Japanese work, which contains a series of many hundred woodcuts of the indigenous plants of that country, of great completeness and accuracy, there is a characteristic figure of it (vol. ii., tab. 45) with the vernacular name Ikariso, which being translated means Anchor-plant, in allusion to the shape of the leaves. Several varieties are known, of which the principal is *E. violaceum*, of Morren and Decaisne (figured *Bot. Mag.*, tab. 3751, and *Bot. Reg.*, vol. xxvi., tab. 43), which differs from the type by its dwarfer habit and smaller violet-coloured flowers, in which the spur of the petal is often not longer than the subtending sepal. *E. fumilum* is a garden name for a dwarf variety of this species. Mr. Ware has furnished me with a very curious form, which I have named *E. citrinum*, and which there can be very little doubt is a hybrid between *macranthum* and *fumilum*. It has a leaf just like that of *macranthum*, peduncles originating in some cases from the petiole, but in others direct from the rootstock, as in our second group, lax simple racemes of 10—12 flowers, ascending pedicels  $\frac{1}{2}$ —1 inch long; a second raceme sometimes produced from the axil of the primary one when the peduncle originates from the petiole, ovate acute lemon-yellow sepals,  $\frac{3}{4}$ — $\frac{1}{2}$  inch long, and petals of the same colour, with an orbicular lamina  $\frac{1}{4}$  inch broad and long, and a cylindrical spur as long as the subtending sepal. It is most like a yellow-flowered variety of *macranthum*, but differs by its short spur and the racemes being simple and sometimes produced direct from the rootstock.

7. *E. Perralderianum*, Cosson, in *Bull. Bot. Soc. France*, vol. ix. (1867), p. 167.—Fully-developed leaf about half a foot long, never consisting of more than three leaflets, which are cordate-ovate, 2—3 inches long, bright green or tinted with red-brown, firm enough in texture to last through the winter, the end one equal-sided, with rounded basal lobes  $\frac{1}{2}$  inch long, nearly or quite touching each other by their inner edges, the two side ones oblique and unequal at the base. Peduncle produced directly from the rootstock, about  $\frac{1}{2}$  foot long. Raceme simple, lax, about as long as the peduncle, 12—20 flowered, with a densely glandulose-pilose axis, and spreading pedicels  $\frac{1}{4}$ — $\frac{1}{2}$  inch long. Expanded flower bright yellow,  $\frac{3}{4}$ — $\frac{1}{2}$  inch in diameter; outer sepals minute, oblong, deciduous; inner sepals orbicular,  $\frac{1}{4}$  inch long and broad, much imbricated, and spreading horizontally when fully expanded; petals with a toothed, bright yellow, erect lamina, about  $\frac{1}{2}$  inch long, and an incurved ligulate brown spur nearly as long as the lamina. Stamens and pistil three times as long as the petal-lamina, the former bright yellow.

A native of mountain woods in the province of Eastern Kabylia in Algeria, at an elevation above sea-level of from 4000 to 5000 feet. Introduced into cultivation by Dr. Cosson in 1867. Our living plant

at Kew was given to us by Dr. Reichenbach. It has never been figured, but a drawing has been made this spring for the *Botanical Magazine*. It is closely allied to *E. fimmatum*.

8. *E. pteroceras*, Morren, in *Journ. Soc. Roy. Bot. et Agric.*, Gand, 1845, fasc. iv., 145, t. 11; Walp. *Rep. v.* 18.—Habit dwarfer than in *E. pinnatum*, and old leaves not lasting through the winter. Fully developed leaf 6—9 inches long, biternate, the nine leaflets similar to those of *pinnatum* and *Perralderianum* in shape and toothing, much tinted with red-brown when young, the end three symmetrically cordate-ovate, the other six oblique at the base. Peduncle half a foot long, produced directly from the rootstock. Raceme lax, simple, 3—4 inches long, 12—20-flowered; pedicels spreading, or ascending,  $\frac{3}{4}$ — $\frac{1}{2}$  inch long, slightly glanduloso-pilose, cernuous at the tip. Expanded flower bright yellow,  $\frac{1}{2}$  inch diameter; outer sepals oblong, yellowish, deciduous,  $\frac{1}{4}$  inch long; inner sepals suborbicular  $\frac{1}{2}$ — $\frac{3}{4}$  inch long and broad, patent when fully expanded; petals bright yellow, with a broad erect toothed very short, emarginate limb, and a red-brown deltoid spur shorter than that of *pinnatum* and dilated at the base into a couple of small blotches of the same colour on the petal-lamina. Stamens as long as the inner sepals, erect, bright yellow.

A little known species, closely allied to *E. pinnatum*, but marked by its dwarfer habit and biternate leaves. It is probably a native of the Caucasian provinces, but the precise locality has not been clearly ascertained, and we have no wild specimen in the Kew herbarium.

9. *E. fimmatum*, Fisch. in *DC. Syst. i.* 29; *DC. Prod. i.* 110; Hook. in *Bot. Mag.*, t. 4456; Morren, in *Belg. Hort.* 1854, t. 6; Boiss. *Fl. Orient. i.* 102.—Fully developed leaves 1— $1\frac{1}{2}$  foot long, consisting of three or five leaflets, of which only the end one is equal at the base, the texture firm enough for them to last through the winter, the teeth small and distant, the rounded basal lobes about  $\frac{1}{2}$  inch long, the petiole and petiolules densely pilose. Peduncle about  $\frac{1}{2}$  foot long, produced directly from the rootstock. Raceme lax, simple,  $\frac{1}{2}$  foot long, bearing 12—20 flowers on short pilose spreading or ascending pedicels  $\frac{1}{2}$ — $\frac{1}{2}$  inch long, all of them simple and solitary, and each subtended at the base by a brown membranous lanceolate bract. Expanded flowers bright yellow,  $\frac{3}{4}$ — $\frac{1}{2}$  inch in diameter; outer sepals oblong, greyish,  $\frac{1}{4}$  inch long, soon falling; inner sepals orbicular,  $\frac{1}{2}$ — $\frac{3}{4}$  inch long and broad, bright lemon-yellow, much imbricated when fully expanded; petal with an erect, toothed, broad yellow lamina  $\frac{1}{2}$  inch long, and a spreading reddish-brown deltoid-cylindrical spur as long as the lamina. Stamens and pistil much exerted from the petal-cup, but rather shorter than the inner sepals, both anther and filament bright yellow.

A native of the Caucasus and northern provinces of Persia. It was introduced into cultivation about 1840, and is well-known to every one who takes an interest in the genus. A well-marked variety for garden purposes is *E. colchicum*, Fischer, MSS., a native of the Caucasus, in which the inner sepals are oblong, not more than  $\frac{1}{4}$  inch broad, and consequently not imbricated when the flower is fully expanded.

10. *E. diphyllum*, Lodd. *Bot. Cab.*, t. 1853; Graham, *Bot. Mag.*, t. 3448; *Aceranthus diphyllum*, Morren and Dene. in *Ann. Sc. Nat.*, ser. 2, il. 349, t. 14; *Epimedium japonicum*, Siebold MSS.—Petiole not more than 2—3 inches long, bearing never more than a couple of cordate-ovate leaves with an oblique base, on erecto-patent petiolules 1 inch long, the teeth usually obsolete except one or two on the basal lobes, the texture of the lamina not firm enough for it to last through the winter. Peduncle springing from the petiole a short distance below its apex, bearing 4—6 drooping flowers in a simple very lax raceme, on erecto-patent, slightly hairy pedicels  $\frac{1}{4}$ — $\frac{1}{2}$  inch long, and sometimes also a single flower from its axil on a long erect pedicel; bracts greenish, very minute. Outer sepals oblong, greenish, deciduous,  $\frac{1}{4}$  inch long; inner sepals white, oblong, or lanceolate,  $\frac{1}{4}$  inch long, nearly flat; petals obovate, obtuse, white, not spurred, a little longer than the inner sepals. Stamens and pistil about half as long as the petals; anther yellow, linear.

A native of Japan, introduced into European gardens about 1830. Much dwarfer than any of the other species, and never with more than a couple of leaflets to a leaf. It is figured in the *So Mokou Zousetsu*, with the vernacular name Baikuwa Ikariso. This was made into a distinct genus by Morren and Decaisne on account of the spur of its petals being quite obsolete, but the general habit is completely that of the other Japanese species.

11. *E. sagittatum*, Baker; *Aceranthus sagittatus*,

Sieb. and Zucc., *Fam. Nat. Jap.*, No. 296; Franch. and Savat. *Enum. Plant. Jap.* t. 24; A. triphyllus and macrophyllus, K. Koch, in *Ann. Mus. Lug.* Bot. i. 253; *Epimedium sinense*, Siebold, MSS.—Leaves biternate,  $\frac{1}{2}$ –2 feet, the firm glabrous common petiole 1 foot long, the nine leaflets cordate-ovate or hastate, very firm in texture, 3–6 inches long, sometimes densely pilose on the under surface, the edge closely fringed with the conspicuous ascending horny teeth, the large basal lobes rounded or pointed, those of the three end leaflets equal, of the other six more or less unequal. Petiole  $\frac{1}{2}$  foot long, its short peduncle springing from the top of the common petiole, the flowers numerous, the lower pedicels 3–5-flowered, only the upper ones simple. Expanded flowers  $\frac{1}{4}$  inch in diameter; outer sepals soon deciduous; inner sepals white, oblong, petals yellow, as long as the sepals, not spurred. Stamens and pistil as long as the petals.

I have never seen this alive, and know the inflorescence and flower only from the figure in the *So Mokou Zeusselt*, vol. ii., t. 44, where it bears the vernacular name of Hozaki-no-ikariso. It occurs in Japanese gardens, but is considered by Franchet and Savatier not to be really wild in Japan. We have a Chinese specimen, in leaf only, at Kew, sent by Dr. Shearer from the province of Kiu Kiang, gathered in 1873. *J. G. Baker.*

(To be continued.)

## IN THE RUSSIAN STEPPES.

(Concluded from p. 652.)

AND now to return to the garden. I may say that it is in the vicinity of this church that the greatest attraction of plants and flowers is to be seen. The mausoleum, or cenotaph, itself about 10 feet wide, may be shortly described as a greenhouse filled with choice flowers. Immediately in front of it is a real gem of a flower garden, well enclosed on all sides with shrubs and trees. It is of moderate size, rectangular in form, and chiefly laid out in very tastefully designed carpet beds, containing *Alternanthera versicolor*, *Iresine Lindeni*, *Lobelia Erinus*, *Pyrethrum Golden Feather*, *Begonia hybrida*, variegated Thyme, and other low-growing species usually employed in such designs. There are also one or two circular groups of larger sorts occupying central positions, and containing some fine Roses, Geraniums, and the large-leaved *Ricinus*, a plant which seems to be in great favour in the Steppes. The border on both sides is filled with standard Roses, Geraniums, Asters, *Celosia cristata*, *Amaranthus*, and the like. Strange enough, there are no *Cinerarias* or *Pelargoniums* to be seen.

During summer the plant-houses are usually quite empty. Here, with the exception of a fine example of *Alsophila australis*, *Pandanus utilis*, and a great mass of *Hoya carnosa* trained up between all the lights in the stove, the numerous collections are all outside, chiefly arranged in neat groups round the church, more or less under the shade and shelter of majestic trees. I counted some thirty handsome Orange trees, mostly in fruit; two or three of them might be about 10 feet high. Several well-grown examples of *Phoenix dactylifera* were equally large; there were also some good specimens of *Lantana borbonica*, *Chamærops humilis*, *Cycas revoluta*, and similar tropical plants. New Holland plants generally, and a numerous collection of choice *Conifere*, including some handsome *Cryptomeria japonica*, were arranged at each side (right and left) of the mausoleum. On another side of the church were some twenty groups of large miscellaneous plants, such as *Myrtles*, *Euonymus*, *Pittosporum*, *Eucalyptus*, *Metrosideros*, *Nyctophylla*, *Laurus*, and especially several fine examples of *Punica granatum*, which, when they happen to be studded with their scarlet flowers, must be very beautiful. The old *Agapanthus umbellatus* keeps up its reputation here: there were some five or six boxes of it well furnished with flowers.

A little way from the church is a large circular enclosure filled with *Camellias*, *Rhododendrons*, *Azaleas*, *Ilex elastica*, *Nerium splendens*, *Viburnum Tinus*, *Aucuba japonica*, *Grevillea robusta*, and, what is very unusual, a fine healthy collection of young *Hollies*. In another part of the ground a great number of large *Arums* occupy a shady place along the side of the walk.

In this country *Orchidæ* and other splendid tropical flowering plants are almost unknown. In such a garden as this we might expect to see an aquarium at least for the commoner sorts of aquatic plants, such

as *Nymphæas*, besides a number of others which require a warm, moist atmosphere; but there is nothing of the kind.

The glasshouses being for the most part empty in summer are not made for show. They are therefore far enough removed from the mansion and pleasure grounds, and occupy a position at one side of a large space, quite enclosed with brick walls, having gates to open or lock as required. The ground within this space is laid out as a nursery for ornamental shrubs and flowering plants to be removed as wanted elsewhere, and the walls are covered with fruit trees, chiefly Vines, Peaches, Apricots. The orchard and frame ground occupy other enclosures further off, and beyond this is a nursery well stocked with young trees and shrubs of every kind, all well enclosed and protected with hedges of *Laburnum* and lines of trees. Communicating with the stove is a pinery, which at the time was full of large and well grown fruit.

The conservatory in which the greenhouse plants are kept during winter is a large structure in the way of an Orange-house, having an ordinary ceiling and perpendicular lights at one side. In this climate, where we have the extremes of heat and cold, a greenhouse with the greatest part of the glass above is not to be recommended. At the same time I consider that the total absence of top-light is also a mistake, especially where an immense number of plants, including many of large size, are kept. It seems to me that a certain compromise in the way of two or three smaller lights above would be preferable—in particular during the spring, when the growing season begins long before the plants can be placed outside. But the fine cultivation, such as is the aim of plant growers in England, is not so much required here, and a great many plants are sometimes stowed away anywhere only to live till the spring. Here a long wide underground passage or tunnel, communicating between two houses, and having only small top-lights at certain distances, does good service in this way during winter.

The fruit garden is extensive, but it is chiefly an orchard, and in this part of the country at least fruit last year was a general failure. Of Apples and Pears especially there were none, owing to late frost and cold cutting east wind. Cherries and Plums were equally scarce, but Vines grown on espaliers were abundant, and, particularly in sheltered situations, ripened nicely by the middle of August. I cannot say that the fruit department here was in such order as might be expected.

It has been long a settled question among fruit growers in England, France, and other countries that the espalier system of training the trees offers the greatest advantages when the object is to obtain choice and well-developed fruit; but here in *Sekirensy* this system is not adopted. The wall-trees, too, do not seem to receive much attention; at least they were not in the best order, and with the exception of a few Peaches protected for the time with lights, there was nothing worthy of note. Nectarines are but little known in this country.

In England generally Peaches on walls ripen well enough in the open air by the middle of August, in Russia twelve days later. Here, with a much warmer climate, they are still green and but little swelled; whereas Vines on espaliers thrive nicely, and are ready for cutting. There seems to be something in this which requires careful study and investigation. It is a subject which is well worthy of experiment, and I am strongly inclined to think that the difference is chiefly owing to atmospheric causes, which in this dry climate might be easily regulated by the simple process of frequent syringing. At the same time I should at least try the result of growing Peaches on low espaliers in a warm sheltered situation.

The mansion is a large two-floored building of very ordinary architectural pretensions in its general form. At the second floor there is a spacious balcony in the middle, having six Grecian pillars surmounted in the usual manner, and from the roof rises a dome or cupola decked with a flag. This style of architecture is common enough in the Steppes. The walls are plastered and whitewashed as a matter of course, and the roof is almost always green. The entrance from the garden side is somewhat original, and may be described as an easy slide from the balcony down to the broad walk, some 15 or 20 yards in front. At each side is a balustrade of short columns and vases, terminating at the walk with two large statues. Underneath are several archways communicating with the

two flower-gardens in front of the house. These gardens are well supplied with plants and flowers of every kind, and are quite enclosed. From the pillars at the balcony down to the walk the balustrades are literally covered with wild Vines and other climbers.

The view from the balcony comprises a splendid circular lawn, about 150 paces in extent, and further on beyond the boundary walk another lawn of the same extent, terminating at the lake, a little only of which is seen from the house. The principal charm of this view is the beautiful well-kept lawn, and the numerous majestic trees in limited groups at each side. Beyond the circular lawn the open space is not so extensive; indeed it is to be regretted that so little of the lake is seen. One or two openings or vistas at the right or left would greatly enhance the perspective. But who would resign himself to the vandalism of cutting down so many trees as might require to be removed? Another subject of regret, and even surprise, is the total absence of Pine trees. Oaks, Elms, Limes, Poplars, and others abound; there are even two beautiful examples of *Elaeagnus angustifolia* near the house, but nowhere, neither in the garden nor in the forest, is there a single Pine-tree to be seen. During so long a time it is strange that the cultivation of *Conifere* should have received so little attention, for here all the common hardier sorts would thrive admirably, and a few groups at least here and there would greatly enhance the beauty of the pleasure-ground. *Fagus sylvatica* and *Sorbus Aucuparia (rabina)* in Russian) have been equally neglected. Another tree, *Acer tataricum* (called here *tchorno klon*), of moderate size, but of singular beauty in autumn, is well worthy of a place in every ornamental group. *Sorbus* especially is of easy culture, and remarkable for its tenacity and vigour in high or exposed situations. Apart from its decided beauty both in summer and autumn, it has the unquestionable merit of not growing very large; it is, therefore, well suited for situations where moderate-sized trees are required: but it is rarely seen anywhere. There are also several species of Willows and Poplars which have a certain effect in a park, on account of their colour as well as form, but here they have been quite discarded, and others of much less value, as wild Pear trees and brushwood (*Melky less*) have been allowed to grow.

The branches of some of the oldest and largest of the trees, especially Oaks, are carefully bound and sustained with strong iron bars. Some of these may be about 200 years old. The trunk of one near the house is nearly 6 feet in diameter. Another, called the "Holy Oak," is an object of great veneration, owing to its having an image—a small picture—set in the trunk, and, as I was informed, the legend is that no human hand has put it there. Such legends are not infrequent in this part of the world.

A drive of two hours or more with Herr Hager round the lake and through the extensive forest—here called the park—enabled me to see another side of this very beautiful place. The lake itself, about half a mile in length and wide in proportion, presents several views of a highly picturesque character, which, however, must be seen to be fully appreciated. This is unquestionably one of the most attractive parts of the place, and shows the importance of water in all successful landscape gardening. I had subsequently an occasion of making use of my pencils and palette to good account.

If there were nothing more than the trees, the lawns, and the lake, *Sekirensy* would still be a splendid residence; what it is with the help of intelligent gardeners, a great number of regular workmen, and everything else that can be required, I have shortly endeavoured to describe. *P. F. Keir, Kieff.*

WASPS.—Whether or no the elements last summer were generally destructive to insect life, it is at least certain that our old enemies, the wasps, did not materially suffer; and, indeed, it would now seem that they rather benefited by the unusual nature of the season. There are few gardeners, perhaps, who have not noticed the abundance of wasps that thus early have been seen specially favouring our glasshouses when the doors are open, as the temperature inside is to them evidently much more enjoyable than the cold biting winds outside. Dozens have already been killed, and no doubt dozens have escaped. If this is the rule everywhere, and not confined to one locality, then wasps will be abundant next summer. If this promise of plenty of plunderers means also plenty to plunder, we shall not largely complain; none the less it will be wise to keep a sharp look-out for the progenitors of what, if not now scotched, may by-and-by prove to be unwelcome visitors.

SELECT INDEX OF PLANTS FROM 1841 TO 1878.—(Continued from p. 588.)

## Notices of Books.

**Strawberries All the Year Round.** By William Hinds.

This is quite an unpretending little volume in appearance, but describing in very decided language the author's successful practice in the cultivation—especially the forcing and pot culture—of this most popular of fruits. It can lay no claim to be a treatise on the general cultivation of the Strawberry, notwithstanding that the author promises to give us "Strawberries all the year round;" for on the cultivation of this fruit in the open ground, which is surely the main and principal part of Strawberry culture, there is comparatively nothing said, some six pages being devoted to this portion of the subject and fifty-four pages to that of its cultivation in pots, &c. The cultivation of Strawberries in pots is evidently with Mr. Hinds a matter of great importance, and the successful practice which he has adopted is very fairly described. There is, however, nothing particularly novel in Mr. Hinds' practice apart from that which he has fully stated in our own columns from time to time. He lays claim to somewhat too much originality in describing the simplest operations in Strawberry culture, and clothes everything with a redundancy of words which is most embarrassing, and much detracts from the value of his treatise.

— *Report on Temperatures During the Winter of 1878-79 at the Royal Botanic Gardens, Edinburgh.* By John Sadler.—What the winter of 1878-79 was like in Edinburgh may be gleaned from the fact that from the last week of November to the second week of February the ground was frozen so hard that no cultivation could be carried on. Mr. Sadler's report is supplemented by notes from various gardens in Scotland. It is to be hoped that Mr. Sadler will continue his observations on the winter of 1879-80.

## Florists' Flowers.

**SEASONABLE NOTES.—AURICULAS.**—Many of the principal growers, including Rev. F. D. Horner and Mr. Benjamin Simonite, prefer to repot their plants in May, and certainly all the plants that are potted at that time succeed well. If the old plants cannot be repotted it will be quite necessary to make an effort to repot all the offsets that were put in about September last year; these were potted singly in small pots in February and now require repotting; ours have been done. The offsets taken off at the time of the surface-dressing have also been repotted in thumb-pots; those known as "long Toms" are the best, as they admit of a larger number of plants being stored in a small space. Those who exhibit Auriculas regularly are careful of their young plants, as many of these are more useful than old staggers. They throw more perfect pips sometimes, and in the eyes of a good judge quality is always preferred to quantity. Seedlings require very much attention at this time, the very small ones to be pricked out of the seed-pans as soon as the first rough leaf is formed, and those that have grown sufficiently so that the leaves about meet together must again be repotted; continue to do this as plants increase in growth. Our plan is to prick out a dozen in a 60-sized pot. When these require potting again, three or four may be potted into the same size, to be finally repotted, one in the centre of each pot, wherein they will flower next season. Do not allow the plants to get too much sun.

### CARNATIONS AND PICOTEES.

There is now a good healthy growth throughout the whole collection, but it is not possible that it can be a strong growth, especially in the case of such varieties as Admiral Curzon, Dreadnought, and indeed all the Scarlet Bizarres with one or two exceptions. See that the flower stems are fastened to the sticks as they spindle for bloom. Destroy greenfly as it appears, and remove any weeds when they are of small size; if the weeds are allowed to become large it injures the plants getting them out. Where the plants have been put out into beds in the open ground, it will be necessary to water them now; after doing so, mulch the surface of the ground with rotten stable manure; and while the dry weather continues, give a good watering once or twice a week as the weather continues cold or the reverse.

### DAHLIAS.

The plants must now be planted out if this has not been already done. The plan of putting the permanent sticks first at the place where the Dahlia is to be planted is the best one, and the plants must be fastened to the sticks as soon as possible after they are put out. In some districts there is danger of frost injuring them up to the middle of June, in that case I would advise the plants being repotted in 6 or 7-inch pots. Keep them in a cold frame, from which the lights are removed constantly except when there is danger of frost.

### GLADIOLUS.

The varieties of *G. gandavensis* are now making a strong growth, for although the ground looks quite dry on the surface, it is not so underneath; the ground between the rows has been hoed over twice. I fancy they succeed best when the surface is frequently stirred. We do not usually water here in a dry season until after the middle of June, by that time each plant has formed a considerable proportion of roots to take it up; we also mulch with rotten manure immediately after this. *G. Colvillii*, variety The Bride, is a very free-growing variety, and it also increases rapidly; it ought to be planted in quantity. The varieties of *G. ramosus* should also be grown for early flowering; leave them in the ground until they form good clumps. *G. byzantinus* should be grown for its early-flowering qualities, and *G. cardinalis* with its bright scarlet flowers flaked with white is a great acquisition in the early flowering section.

### HOLLYHOCKS.

The attention required at present is of a very simple kind; water the plants, and mulch with manure as recommended for most other gross feeding plants. As the flower-stems continue to develop fasten them to the sticks. During hot and dry weather red-spider attacks the under-side of the leaves, but it can be destroyed by frequent syringing. Seeds should be sown now if not previously done: the plants obtained from this sowing will flower very strongly next year.

### PANSIES.

It is better not to trouble about the pot plants now. Take what cuttings may be wanted for autumn bloom, and throw the old plants away. They are in full bloom out-of-doors this month, and to keep up the stamina of the plants manure-water must be freely applied in hot, dry weather. Pick off the blooms as soon as they begin to fade; and when the flowers degenerate pick them off. If the shoots are well thinned out, some rich soil placed round the plants, and the growths pegged down close to the soil, the next blooms will be as good as they were at first.

### PINKS.

Towards the end of June will be the time to prepare a bed and plant out the seedlings, which ought to be quite large enough by that time; plant 6 inches apart, and 9 inches between the rows. The grower for exhibition will be daily looking over his plants, as the beds are expected to be in full bloom by the third week in June, and previous to this all the pods must be examined, and those that are likely to split must be tied with a strip of matting. They require watching after being tied, in case the matting should be too tight. The beds will probably have been surface-dressed with rotten manure, as previously advised; if so, water freely while the weather is dry. About the end of the month put in pipings.

### POLYANTHUSES.

These suffer severely in dry hot weather unless well supplied with water, and this is all that will be required at present. Prick out seedling plants into boxes or into a small bed of fine soil in a shady place. Towards the end of June the seeds will ripen and must be gathered every day.

### RANUNCULUSES.

Shade from bright sun, which very speedily injures both foliage and flowers. The old-fashioned plan of bending hoops over the beds and laying a mat over them answers well enough to protect the flowers, as it is a good shade; but if a framework can be made of some light material raised about 4 feet above the plants, and some light scrim canvas stretched over it, this is neater and answers quite as well. See that the plants do not suffer for want of water; this should be applied with a small rose, so that the foliage does not get wetted every time. When the flowers fade

and it is intended to save seed the stems must be tied to sticks else the weight of the pods will bend down the stem, and if it does not snap it the pods are not exposed to the sun enough as they lie on the ground.

### TULIPS.

As soon as the flowers fade, the coverings must be removed to allow the sun to act freely upon the leaves; these speedily become brown, and the bulbs may then be taken up, but do not dry them in the sun. The best plan is to have a number of pots ready, and place the bulbs in them at once, merely removing the loose earth. Carry the pots away immediately to an airy loft.

### ROSES.

Constant attention is now required amongst these. The Rose maggot is very active at present, and where there is a large collection it must be looked over every day. Destroy the maggots with as little injury as possible to the Roses. Suckers are now making vigorous growth, to the sad detriment of the parent trees; work underground and cut the sucker where it unites with the roots or underground stem. Destroy greenfly as soon as it appears. Pot Roses that were forced early and have now gone out of bloom should have the flower-stems cut off, and the plants should be placed behind a low wall or hedge on a hard bottom of ashes. Do not over-water, keep the leaves free from mildew and greenfly; the mildew is most insidious, but if the affected parts are dusted with flowers of sulphur in the earliest stage, it can be destroyed. *J. Douglas, Loxford, Ilford.*

## Garden Operations.

### FLOWER GARDEN, ETC.

**BEDDING-OUT.**—After several weeks of unmitigated "north-easters," the wind on the 19th suddenly veered round to west, and so raised both our hopes and energies that we started forthwith to get out all plants except the most tender, and these it is not safe to plant out till the first or second week in June; but meanwhile the plants are being gradually inured to bear full exposure. Alternantheras, struck in dung-pits, have the lights drawn quite off during the daytime; Coleus and Resine are in cold pits, and subtropicals in warm sheltered corners and in turf-pits. Work presses in every department of a garden now, and it is a matter of necessity to get over it quickly; but for all that there should be no "scamping" it, as is too often the case in this matter of bedding out; any so disposed would do well to bear in mind the truism that "work well done is twice done," and also that the essential conditions of the plants starting into growth at once are that the roots be in the same state as to moisture as the ground in which they are to be planted, and that the soil be well compressed about the roots.

**ARRANGEMENT OF SUBTROPICAL PLANTS.**—At p. 622 allusion is made to, and hints given concerning various bedding arrangements: I now desire to supplement those hints by adding thereto a note regarding the arrangement of these. My knowledge and use of this class of plants for decorative purposes is somewhat limited, but the practical lessons learned regarding arranging them to the best advantage are none the less deeply rooted, and may be of service to the inexperienced. The position or situation for such a garden is of first importance. For obvious reasons it should be sheltered from high winds. A well-drained dell, a southern slope, or a secluded spot in shrubberies, are the best spots, and there should be no attempt at geometry by cutting out fantastic-shaped beds—round and oval forms are always the most pleasing and easy of arrangement, the size of bed being determined by the space of ground and surroundings, which if of a contracted nature, then the beds should also be proportionately small, and *vice versa*. As to arrangements of plants in the beds, none are more effective than those that are confined to one variety, with a central plant as a standard of a different and opposite nature, and an undergrowth of plants to contrast both in colour and habit from the taller growers, which can then be given ample space for full development, and yet the beds will be furnished at once. To give an example:—Wigandias, in good soil, require at least 3 feet of space to display their full beauty; they should therefore be given this amount, and the intermediate spaces be planted with *Cineraria maritima*, *Gnaphalium lanatum*, variegated Periwinkle, or variegated Mesembryanthemum; these all grow under the shade of, and contrast well with, the foliage of the Wigandias. As a central plant for such an arrangement none excels *Acacia lophantha*. Similar arrangements, with as great a variety of plants as possible, should be followed out in all beds. Of course there

is no reason why two varieties of the same species should not be associated in the same bed; as, for instance, with Castor-oils, the tall growing kinds, for the inner, and the dwarfier for the outer lines, and the same with respect to Solanums—*S. giganteum* for the middle, and *marginatum* or *robustum* nearest the edge. By adherence to this rule of planting there is no danger of the incongruous commingling of plants unsuited for juxtaposition with each other; and pleasing variety is assured by each bed presenting a distinctive character to that of its neighbour.

**HERBACEOUS AND MIXED FLOWER BORDERS.**—Place supports to Pyrethrus, Sweet Peas, Convolvulus, and all other plants requiring that aid. Keep weeds in check by surface hoeing in fine weather, and when showery fill up vacant spaces by planting out Dahlias, Hollyhocks, Asters, Stocks, Zinnias, Phlox Drummondii, Wallflowers and the like. Anything like formality of arrangement of plants in such borders should always be avoided, yet some thought, and especially knowledge as to height of plants, is necessary to give each their rightful position. The foliage of bulbous plants that are dying down should be tied together with bast matting till it finally dies off, and patches of surface-rooting Sedums or Saxifrages be planted to fill up the blanks thus caused. The ground beneath and between tall-growing plants may be similarly treated, and the same low-growing plants can be as effectively used to produce separate clumps of colour near the margin of the border.

**GENERAL WORK.**—Water Roses, and keep them free of aphids by syringing with tobacco-liquor or strong soapsuds. To destroy mildew, dust with sulphur; and to prevent it keep them well mulched and moist at the root. Clip Box edgings, and water any that have been newly planted; knife in evergreen hedges, and remove seed-pods from the early Rhododendrons and Azaleas. Clip the grass edgings of shrubby clumps and walks once a fortnight, and roll walks after heavy rains. The drought is telling against lately removed shrubs and trees; they should now have plenty of water, and mulchings of litter or lawn mowings to conserve the moisture as long as possible. *W. Wildsmith, Heckfield.*

#### HARDY FRUIT GARDEN.

After a lengthened period of anxiety one is able at last to state definitely the condition of fruit trees and the prospects generally of the forthcoming harvest of hardy fruits. The supply of stoned fruits, which only a short time ago promised to be abundant, has sorely diminished during the past fortnight, with us at any rate; and, with the exception of Coe's Golden Drop and a few trees of Green Gage, the Plum crop cannot be described as being more than a moderate one. Cherries have suffered a worse fate as far as regards dessert varieties, but Morellos look much better. It is more than probable, however, that those who enjoy the salubrious air of higher altitudes, where the wood has been better ripened, will fare better. It is worthy of particular notice that fruit trees upon north walls are decidedly cleaner, healthier, and altogether in much better condition than the same kinds of trees upon east or west walls. The explanation is simple, in the fact that the trees in north situations have not been exposed to the same violent variations of temperature that trees in other situations have been exposed to lately. I have never seen black and greenfly less troublesome upon wall trees, thanks to the hardy nature of the growth the trees are making under the influence of drying winds and plenty of sun. Whenever the pest is discovered, however, it should be dislodged immediately by means of the garden engine, which will be found a sufficient remedy to keep a mild attack of the insect in check. Caterpillars are still troublesome upon Apricots and Plums, and these are best kept under by looking over the trees every morning and afternoon, and destroying them with the hands. If not watched assiduously they perforate the leaves, and seriously damage the health of the tree. Vines upon walls will now require disbudbing and regulating, so as to fill up any blanks that may occur through some of the unripened shoots being killed by the late severe winter. Figs are also coming away weakly, and if their shoots are thinned out in good time, and those that are left to bear fruit are pinched, the check they have received may induce fruitfulness in gross growing trees. This class of work should not be put off from day to day until the shoots ramble away into a semi-wild state with the advent of warm weather. Pinch at the fourth or fifth leaf, and lay in the shoots thinly in order that they may get consolidated and ripened. We have already soaked the roots of all our wall trees with water that was exposed to the action of the sun for several hours before it was used. Small fruits generally are promising crops. Black Currant trees affected with greenfly should have the infested portions pinched out, which will prevent the further spread of the insect, until we get the thunder shower which threatens daily to thoroughly clear the

trees of those unwelcome visitors. Strawberries are suffering severely in light soils, and nothing but a thorough soaking of water at the root and heavy surface mulching will secure a crop. Continue to make successional plantations for fruiting next autumn from forced plants, and for supplying the general crop next year. *W. Hinds, Conford.*

#### FRUIT HOUSES.

**VINES.**—The Vines from which we obtain our latest Hamburg Grapes through November and December are now in flower. The house, a span-roof with glass sides, is used for wintering large plants, and the temperature near the roof is often below the freezing point in severe weather. It is efficiently ventilated, and we endeavour to prevent the plants from making young growth before it is safe to remove them to the open air for the summer. When the Grapes are quite ripe they are cut with wood, bottled and placed in the Lady Downe's house to make room for the plants over which ripe Grapes of any kind, especially Hamburgs, would not keep through November. We then throw open all the ventilators and apply dry fire-heat until the leaves fall off from the Vines, and we are satisfied that the wood is quite ripe. The Vines are planted in a narrow inside border, and have about 9 feet of clean stem up which we train pot Tomatoes, allowing them to root into the mulching. They present a very ornamental appearance, clothe the sides of the house, and produce a continuous supply of excellent fruit. My object in writing the above is to show that the starting and ripening of Grapes or other fruit may be retarded for a considerable time, and that large houses used for terrace plants in winter may be turned to profit and ornament in summer—the points to be observed in their successful management being complete ventilation, sound, elevated, but not over-rich borders, frequent lifting and relaying of roots, and liberal firing after the Grapes are cut. Some years ago I tried Lady Downe's, but notwithstanding the fact that they set well and made fine bunches, the season of growth was too short and they were removed.

In many houses this fine late kind, together with Mrs. Pince's Black Muscat, Black Morocco, and some of the white kinds, will now be in flower, and if it can be managed, a Hamburg Vine should be in flower also for cross-fertilising the shy setters. Many of these kinds do well through the early stages with and under Muscat treatment; but the time arrives when the high temperature essential to the finish of Muscats does not favour the colouring of the black kinds, and although they eat well they often remain deficient in finish. Gros Colmar, on the other hand, will stand any amount of heat, but the foliage is not the best for withstanding bright sunshine; this defect, however, makes little difference, as the fruit seems to swell and often colours after the leaves are gone. To grow the finer kinds of black Grapes for winter and spring use they should be kept out of the Muscat-house altogether, and they should have the benefit of a long period for making and maturing their growth. By this time the thinning of the main crop of Muscats will have been brought to a close, and the borders will be in a fit state for mulching with good rotten manure, and the reception of copious supplies of water. It will be necessary to keep the external borders well covered with leaves or litter to prevent the escape of moisture, and on light soils the application of water or diluted liquid manure may be needful. Give more air to the early pot Vines intended for fruiting next spring, and syringe the foliage to keep it free from insects, as future success is made or marred by the preservation or premature destruction of the main leaves. *W. Coleman, Eastnor.*

#### MELONS.

Continue the earthing-up of the hillocks in successional-houses, pits, and frames, as the roots protrude through the sides of the mound, and until the allotted space for that purpose is filled, and see that plants suffer not for want of, or from too much, water at the roots. Allow those plants which are swelling off their fruits to have liberal supplies of tepid liquid manure, not too strong, immediately after they have had clear water applied to their roots, which should always pioneer the thicker and more stimulating fluid. Let the atmospheric moisture of the various houses, pits, and frames, be in accordance with that stage of growth at which the occupant of each structure may have arrived. Plants coming into flower must have plenty of ventilation during the day, the syringe being withheld from them until they have set their fruit, after which it can be brought into use again. The shoots of young plants which are now covering the surface of the bed should be thinned out to three or four leading shoots, and these must be stopped as soon as they have partly covered the bed; as a matter of course, this will result in the production of fruit-bearing shoots which, when they expand their flowers, should be impregnated when the pollen is dry. Three or four fruit to each plant, according to its strength, will be sufficient for a crop. *H. W. Ward, Longford Castle.*

#### PLANT HOUSES.

**FERNERY.**—Now that the young fronds of Ferns are in an advanced condition, the whole of the old shabby foliage may be removed without any detriment to the plants, and in cases where the roots are at all confined and the drainage free and open, as it should be, water must be given copiously, and a thoroughly moist condition of the atmosphere maintained in order to encourage quick growth. With this view it will be necessary to syringe heavily both in the morning and evening, so as to wet every portion of the rock or interior of the house, which should be closed early that the plants may enjoy the genial warmth afforded by the sun, which is very conducive to health. Where fixed shades have to be used, they ought to be of the thinnest material, and if possible placed outside the glass, as there they will help to moderate the great solar heat we may expect to get by-and-bye, and keep the internal air more humid and uniform. Ferns grown for the sake of their fronds for cutting cannot well have too much light, as by full exposure to its influence the texture is greatly improved, and instead of shrivelling up when severed from the plants they last fresh and remain in good order for days.

**GREENHOUSES.**—Many of the hardier occupants of these structures will, after this, be quite safe outdoors, but in removing them to the open much caution is needed to prevent the foliage suffering from sudden exposure, as even Rhododendrons and hard-leaved plants of that class often get browned and injured unless they have plenty of shade for a time to gradually inure them to the change and enable the tissues to become thicker and firmer. This being the case, the best way is to place the plants immediately under the protection of a high wall, fence, or building, where they can stand out of reach of sharp draughts, the drying effect of which is even more trying than sun. To modify the change as much as possible, advantage should be taken of dull showery weather to get them out, and it will be a great help if they are syringed overhead, in the event of the atmosphere becoming at all arid. After a week or so the plants may be arranged in their summer quarters, in doing which it is very important that each be stood on a tile or slate to stop the ingress of worms and secure good drainage, and to prevent the roots on the outside of the ball from suffering through the rapid desiccation of the soil where it touches the pots: these latter should be protected by being surrounded with litter or leaves. Arranged in this way the soil remains more uniform altogether, and the plants are consequently in a better position to maintain themselves in health than they would be were they subject to sudden changes, as must of necessity be the case when the pots are exposed. Such things as Richardias, Spiraeas, and Eupatoriums will do far best planted out in shallow trenches, where they will be handy for water, and if kept well supplied with this and liquid manure they will grow very strong, and be fine for taking up again in the autumn. Salvias, too, and Chrysanthemums do remarkably well treated in the same manner or planted on the flat, and not only may larger, healthier plants be obtained in that way, but it saves much time and labour during the summer months, when there is so much else to attend to. Azaleas that are now out of bloom will be greatly benefited by having a closer and moister atmosphere than that of an ordinary greenhouse, as in the latter the conditions are not favourable to free growth and a full development of flower-bud. With free syringing, Azaleas stand and enjoy great heat if afforded by early closing; and by assisting them in this way, and getting them well advanced at this end of the season, there will be no difficulty in ripening up the wood at the other. The great point with the plants now is, to see that they do not suffer from want of water, as when pot-bound, and subjected to a higher temperature, it is surprising the quantity they will take. It is not the dribblets, however, that are required, but a thorough soaking, so as to permeate the whole of the ball, for if the interior is allowed to become dry there is generally a difficulty in wetting it again. To make sure therefore that the watering is effectual it is always advisable to go over the plants a second time, as in potting it often happens that there is not sufficient space left to hold what they require. To keep the conservatory roof climbers in anything like order they will need frequent attention or they soon get so thick as to become a tangled mass; but beyond judicious thinning and regulating, the less training they have the more natural and better will they look. As the borders in which these plants are grown are usually very circumscribed, they cannot well have too much water for the next few months, and especially is this so as regards those containing Tacsonias and Lapagerias, the former of which, if the soil becomes at all dry, soon get disfigured by red-spider, and the latter by scale and thrips. Besides these pests, greenfly are very fond of the young shoots of Lapagerias, which they soon disfigure and cripple, but if dusted with tobacco-powder they are so discomfited that they may readily be dislodged by a free use of the syringe. *J. Sheppard, Wolverstone.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	MAY 31	Sale of Imported Orchids, at Stevens' Rooms.
TUESDAY,	JUNE 1	Sale of the Fading Park Estate, at the Mart, by Debenham, Lewson & Farmer; Bath and West of England Society's Show opens at Worcester.
WEDNESDAY,	JUNE 2	Sale of First Part of Mr. Turner's Collection of Orchids, at Stevens' Rooms.
THURSDAY,	JUNE 3	Meeting of the Linnean Society, at 8 P.M.
FRIDAY,	JUNE 4	Second Day's Sale of Mr. Turner's Orchids.
		Third Day's Sale of Mr. Turner's Orchids.

LIKE the Chinese Primrose and the Cineraria, THE CALCEOLARIA is a deservedly popular greenhouse plant. It is managed with comparative ease, it is a free and rapid grower it is marvellously free of bloom, and of great decorative value when the plants are at their best. It is of but few plants that such a warm commendation can be written.

We can remember the time when the herbaceous Calceolaria was a very different thing to what it is now. Then (and we are thinking of thirty years ago) the flowers were small, and somewhat limited in point of colour, the growth spare and tall; indeed, that was the time when it was beginning to pass through certain stages of development which have issued into the splendid forms—dwarf in growth, but of vigorous branching habit—we see in the present day. Then it was the custom to select and name the finest flowers in a batch of seedlings, as we do Pansies, Antirrhinums, Phloxes, &c., in the present day; now strains of the Calceolaria are so fine, and such superb forms can be produced from seed, that it is a work of supererogation to name them. Then particular varieties of the Calceolaria were propagated by cuttings; now we can depend on seed, provided it has been saved from a fine strain, to yield us the finest types—in fact, all we could well desire.

The Calceolaria can lay claim to be one of the gayest of greenhouse plants. The crimson, maroon, orange, mauve, violet, pink, and other striking hues are almost peculiar to this flower and the Salpiglossis among hardy annuals. The flowers are borne in dense masses, and if, as some say, the blossoms are short-lived, there is, to a great extent, a succession, and thus the gaiety of the colours illumines a house for some time. As an exhibition plant the Calceolaria has for a long series of years taken a foremost place, and in the month of May especially it is at its best, and we of the present day are accustomed to see plants 18 inches to 2 feet in height, with an abundance of healthy leaves down to the rims of the pots, a perfect mass of bloom—and such flowers, too—large in size, fine in form, and handsome in shape. We owe it to many growers that the character of the Calceolaria has been so much changed and improved during the past quarter of a century; for it is seldom that one man does all this needful work himself, though some excel and make more rapid and palpable strides than others. The Calceolaria growers of the present day have entered into the possession and enjoy much of which their forefathers scarcely dreamed.

Like the Cineraria, the Calceolaria incurs the charge of being a dirty plant—that is, it is one peculiarly subject to the attacks of greenfly, as also one that soon shows the effects of the attacks. Close watchfulness is necessary, and if fumigation be resorted to in time the plants are soon cleansed from the intruder. It is they who neglect timely precautions who have to mourn over dirty plants. We have seen houses

filled with good specimens in a perfectly healthy and clean condition, thus showing it is but a matter of proper attention to the requisite time.

It is a very simple task to raise Calceolarias from seed, so much so, that if some seed were sprinkled on the ground in a cool moist place in a cold frame, it would be certain to grow. It is the custom of some to make two sowings of seed in a season—one in the middle of July and another early in August, but, unless a large number of plants be required, it will be found one sowing will give all that is necessary. It is one of the minutest of flower seeds, and needs to be sown as thinly as possible. The popular plan is to sow in ordinary seed-pans half filled with drainage, the compost consisting of a mixture of two-thirds soft fine loam, the rest peat and leaf-mould in equal proportions, with a good sprinkling of silver-sand, the whole being well mixed and tolerably fine. The fine roots of the tiny plants run freely among the light particles of the soil, after a quick time of germination, but this depends upon proper treatment and correct sowing. The pans, being filled with soil, should be well watered through a fine rose, so as to saturate every portion of it, and then left for a little while to dry on the surface; then scatter the seeds very thinly on the surface, and cover them with a delicate coating of fine soil. The pans

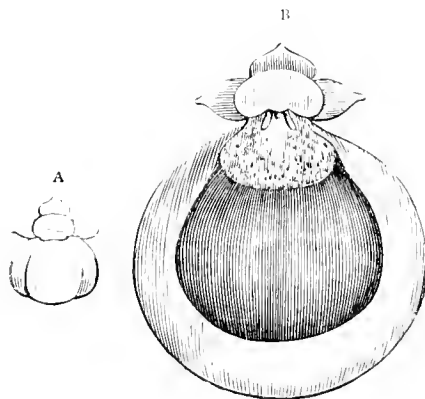

FIG. 119.—A, CALCEOLARIA ARACHNOIDEA; B, THE CALCEOLARIA OF FORTY YEARS AGO.

can then be placed in a cool frame in the shade, and if kept moist plants will appear ere long. Some put a little moss on the surface, others a piece of glass over each pan. The great essentials are to keep the surface moist and cool, and when watering has to be done to perform it with great tenderness. As the seedling plants attain size air must be given, for it is in the young state that the foundations of flourishing, healthy plants are laid. When the seedlings are large enough to handle they should be pricked off into other pans of similar soil, and every encouragement given them to grow. Then follows potting singly into small pots, increasing the size of the pots as the plants develop. The plants make rapid progress at this stage, and he is a wise cultivator who gets them into as large a size as possible consistent with a dwarf hardy growth by the time the summer days darken into those of autumn. During this time frequent fumigations will be necessary to keep down greenfly, and giving air to encourage a hardy and robust growth. The Calceolaria is a hardier plant than many imagine, and can be wintered with safety in a cold frame, provided the frost be kept from them by means of suitable covering. The great requisites are to give the plants plenty of air on all favourable occasions, and to keep them fairly dry at the roots.

As the spring time comes on the plants will have well filled their pots with roots, more water must be given, and some weak manure-

water be given twice a week. A little training is also necessary to secure good well grown specimens, and so the shoots should be brought down to the rims of the pots, pegging them if possible, as they in their turn send forth fresh roots, materially aiding vigorous development. According to the time at which it is desired to have the plants in flower should the shoots be stopped, and in this way successive batches can be had. The earliest plants in May, and later ones in June and July, will then gladden the heart of the grower with blossoms that will crown his exertions with success, and richly reward him for his labour. In a cool, airy greenhouse, where the plants can be shaded from the sun, and a subdued light maintained, they will last for a long time to come.

It is a matter for great regret that the fine shrubby kinds, grown fifteen and twenty years ago, are now scarcely to be met with. They were a most useful race of Calceolarias, but are nearly lost. The fact that they had to be propagated by cuttings told against them no doubt. But they were made to serve one good purpose—the blood of the race was used in giving strength and vigour to the annual types, and we have now in association to a considerable extent the robustness of the one and the size and beauty of the flowers of the other. In certain districts of the country, shrubby Calceolarias may be met with as window plants in cottage residences; some day these will be rescued from their comparative oblivion and once more take their place in our greenhouses.

In our volume for 1841 is given a history of the Calceolaria up to that time, which is very instructive reading now-a-days. From the statement there made it appears that *C. corymbosa* was raised from imported seed in 1823, and that *C. arachnoidea* was introduced about the same time. These were the parents of a hybrid race, which subsequently became further crossed with *C. viscosissima*. We are enabled to give illustrations of the flowers of one of these species (fig. 119 A), and of what was considered a good Calceolaria in 1841 (fig. 119 B); and the progress that has been made since may be judged by comparing them with the illustrations we give of the Calceolaria in 1880.

Looking over some illustrated floricultural works recently we were also afforded the opportunity of comparing the Calceolaria blooms of 1850 with those of 1880. That we have gained enormously in point of size, as well as in that of strongly marked and rich colours, cannot be denied. The progress has been wonderful; but in the race for size we have lost sight to some extent of that symmetry so dear to Messrs. KINGHORN, CONSTANTINE, and others, who made the Calceolaria famous before the present generation saw the light. But we progress notwithstanding, and the moving hand that year by year leaves on the pages of Nature tracings of the advance it is ordained shall be made, will presently write down the clear lines of new forms of beauty as a heritage for those who are working for and waiting patiently the time when fulfilment will give place to prophecy and prediction be lost in certainty and possession.

The coloured plate issued with the present number was drawn by Mr. FITCH, from specimens grown by Mr. RAPLEY, when gardener to ROBERT HUDSON, Esq., of Clapham Common. Mr. RAPLEY is now gardener to J. BRAND, Esq., Bedford Hill House, Balham, at which place he has now in flower a very fine collection.

— THE SINGLE PINK THORN.—This is a singularly pretty and effective tree for spring blooming in forecourt gardens, and is not only well adapted for the suburbs of towns, but should also be largely planted. It is very free indeed, and the colour singularly bright and effective. When well established it grows freely, and the modern jobbing gardener, who

FIG. 120.—CALCEOLARIA CRYSTAL PALACE.

above all things believes in and carries into practice the notion that the round form is the most natural in bushes and trees, clips away at it with his shears in autumn, and makes the mop-head his ideal of beauty in outline. If he would only permit the tree to grow naturally, and be satisfied with simply cutting back into proper bounds all exuberant growths! Close by the spot where we are now writing there are two of these trees, one of which was cruelly trimmed back with the shears in November, and is now destitute of flowers; the companion tree was happily operated on by another gardener, and he contented himself simply with cutting out the gross shoots. This tree is now densely laden with trusses of bloom of the most cheerful character, and is the admiration and envy of passers by. The double Pink and double crimson forms are most effective also, but for picturesque effect the single form can hold its own against the finest of them.

— **ROSES IN POTS.**—Mr. George POULTON, of Edmonton, is now sending into the market some plants of H.P. Rose Baroness de Rothschild, in 48-sized pots, that are most interesting illustrations of successful Rose culture. The plants are some 25 to 30 inches in height, they have three and four main shoots springing from the base of the plant, and each carries a fully developed blossom, with a companion bud or two. The flowers are large, full, and most charmingly coloured—a deliciously soft, silken, fleshy-pink; and the foliage is large, healthy, and plentiful. It is another testimony to the capacities of the 48 pot as a vehicle in which to grow plants of marvellous development. A lady can go to market and take away one of these Roses with comfort; but when 8-inch and 10-inch pots are used for Roses, the size and weight of the plants are qualities that tell against them. It would appear as if these Roses are on their own roots, and no one will be surprised to hear they are soon bought up at good prices.

— **DOUBLE GERMAN WALLFLOWERS.**—A remarkable, and, it may be added, an unusual collection of these fine Wallflowers is now in bloom at the London Road florists' flower seed grounds of Messrs. SUTTON & SONS, at Reading. Two excellent qualities characterise these plants; one is that they show so much variety of colour, the other being their massive, well-furnished spikes, representing the outlines of German Stocks rather than Wallflowers; a third, and most excellent feature, is their dwarf growth, in which respect they differ materially from our English types of double Wallflowers, which are of tall and straggling growth. Some of the orange and golden self-colours are particularly fine, the individual flowers very large and full. Such a strain as that in the possession of Messrs. SUTTON & SONS contains a very large percentage of double flowers, but this may be generally characteristic of strains of improved double German Wallflowers now offered for sale. Much has been done by careful selection; the flowers under notice had been selected with much care. The seeds were sown at the end of June or early in July last, and treated much as we treat single Wallflowers. If a stand of cut spikes of Messrs. SUTTON & SONS' double Wallflowers could be, when in their best condition, exhibited at one of the meetings of the Royal Horticultural Society, much would be done towards securing for these most deserving subjects a greatly increased share of public attention.

— **COMMEMORATIVE TREE PLANTING.**—After taking part on Friday, May 21, in the presentation of a portrait to Principal TULLOCH, the Lord High Commissioner, Lord ROSSLYN, accompanied by the Countess of ROSSLYN, Misses MAYNARD, Sir ARTHUR HALKETT, Captain BAILLIE, Dr. HAMILTON RAMSAY, and Mr. ELLIS, visited Sir NOEL and Lady PATON, and spent some time in Sir NOEL's studio. The distinguished party afterwards drove to the Royal Botanic Garden, where it had been arranged that his Lordship should plant a tree in commemoration of his present visit to Edinburgh. They were received at the entrance by Mr. SADLER, Curator of the Garden, and being subsequently joined by the ex-Regius Keeper, Dr. BALFOUR, were conducted to the terrace in front of the range of conservatories, where Mr. SADLER had made preparations for planting a fine specimen of *Libocedrus decurrens*, the White Cedar of California. The tree in question is a noble evergreen Conifer, found along the banks of the Columbia River and on the Californian mountains,

where it attains the height of 140 feet. The Lord High Commissioner having duly performed the ceremony of planting, and filled in a considerable quantity of soil, a garden watering-pot was handed to Lady ROSSLYN, who bestowed its contents upon the young Fir; his Lordship remarking that he had played the part of PAUL, and her Ladyship that of APOLLO, but the increase must come from a higher hand. The tree thus added to the ornaments of the garden comes in as a companion to that planted last year by the Countess of ROSSLYN—a specimen of *Retinospora obtusa*, the Tree of the Sun of Japan—which, it may be mentioned, has thriven most satisfactorily. At the close of the ceremony, which was witnessed by a considerable number of people, the Lord High Commissioner and party visited Mr. SADLER's house, where they saw the famous Sea Anemone, "Granny," which has been in the same glass jar for the last fifty-two years.

— **LILIUM POLYPHYLLUM.**—We are informed that this Lily, a native of the western temperate Himalaya, is now in bloom at Mr. BULL's establishment. At the time that Mr. BAKER wrote his monograph in our columns in 1871 no cultivated specimen had been seen.

— **PEAS.**—The market Pea crop will this year not be a heavy one, as extensive breadths show a thin plant, and only a change to warm rains and softer nights can bring about that filling out which sometimes helps to make a thin Pea plant profitable. The earliest sowings put in during February are now in full bloom and look well; these consist chiefly of Sangster's No. 1, still the hardest and safest Pea for early sowing. It is not probable that green Peas will make any considerable show in the market until about June 10 or 12. The thinnest plant is found amongst the wrinkled Marrows, such as Veitch's Perfection and Champion of England, both favoured kinds. Rather better are the earlier intermediate sowings of Harrison's Glory and Laxton's Supreme, both kinds largely grown.

— **LATE FROST.**—The most destructive and perhaps the last of all the spring frosts was that of the morning of the 19th inst., when Potatoes in the open field that had stood through the cold east winds succumbed to the first quiet cold night. This result shows once more how difficult it is to reconcile early planting with entire immunity from frost. Exposed Strawberry blooms have been blackened, but there is such a wonderful lot of bloom this year, and that so strong and healthy, that only an unwonted late frost can prevent a large crop of that fruit. Gooseberries exposed to the weather have been discoloured, but otherwise not materially injured. Such a curious result as entire beds of young plants of Veitch's Giant Autumn Cauliflower cut quite off were seen, and also Cape Broccolis. All these effects of the late frost, however, appear to be slight as compared with the mischief done to Vines and tender trees on the Continent.

— **ODONTOGLOSSUM CRISTATELLUM.**—This curious Orchid, supposed to be a hybrid between *O. cristatum* and *O. triumphans*, or epidendroides, is now in bloom in Mr. BULL's nursery. It was described in our columns by Professor REICHENBACH, vol. x., 1878, p. 716.

— **BATH AND WEST OF ENGLAND SOCIETY.**—The hundred-and-third annual exhibition of this Society will be opened at Worcester on Wednesday next, and close on the evening of Monday, June 7. The exhibition is expected to be such as to have been hardly surpassed by any of its predecessors. In the implement department there is a large increase over last year, there being in the department of machinery in motion no less than eighty-five compartments, occupied by all the leading firms of agricultural engineers. The numbers in the live stock department are in the aggregate not unlike those of the excellent show of last year, although, of course, more numerous in the entries for the distinctive breeds of the district wherein the show is held. The poultry show will rival, if not exceed, that at Oxford in 1878, which was up to that time the largest ever held by the Society. An appropriate speciality of the exhibition will be an extensive and choice display of the artistic wares for which Worcester is famous. The Royal Porcelain Works and other well-known makers will have stands in the arts manufacture department, and

their names are a guarantee that the reputation of the city will be maintained. The horticultural department will, as usual, form an attractive feature of the exhibition, and will consist of a number of rich specimens from the floral collections of gentlemen and nurserymen in Worcestershire and adjacent counties. It may be added that the showyard is particularly accessible from and near to the city and railway stations, and that special trains will be run to suit the convenience of visitors from all parts, many of whom will no doubt be additionally attracted by the architectural beauty of the Cathedral and the proximity of the far-famed Malvern hills.

— **COLLEGE GARDEN, DUBLIN.**—We are pleased to hear and have evidences of the activity of the newly appointed Curator of this establishment. In a box just received from him we find specimens of the following plants, together with notes, which will be read with interest:—"I was well pleased to see such a fine engraving of the autumn, winter, and spring blooming *Euphorbia Characias* in your last edition, and now send you a few more old friends with hardy flowers for packing material. *Veronica Hulkeana* sprays, from outside; it is perfectly hardy here at Dublin, and is just now very beautiful, quite small wall shrubs of it being a dense mass of pale mauve panicles. *Armeria grandiflora* is one of our best and most constantly beautiful rockery plants. I send a spike of our variety of *Orchis foliosa*. It was brought to the garden here some years ago from Algiers by Dr. E. PERCEVAL WRIGHT, the Professor of Botany at Trinity College, and is one of the finest of terrestrial Orchids, having a constitution so robust that it increases in size and vigour from year to year. It grows robustly in a cold shady frame. The spikes when fully developed are a foot in length—that is, when in full beauty, with more buds to expand; but when fully developed—*i.e.*, when the last buds are open—they frequently attain a length of 15 inches. The *Leptospermum scoparium* forms a greenhouse shrub 6 to 8 feet high, and is covered with those sprays in a way very suggestive of Hawthorn. I shall be glad to know how damp paper and soft hardy flowers serve as packing [Very well]. I always detest the use of cotton-wool." [It should be peremptorily abolished for such purposes. EDS].

— **ORIGIN OF PYRETHRUM GOLDEN FEATHER.**—With reference to the origin of this immensely popular bedding plant, the Rev. G. PINDER, late Vicar of Harford, writes to the *Journal of Horticulture*:—"So many erroneous statements have been made as to the origin of this plant, I am wishful that the honour of its origin should be given to the one to whom it is due. The originator of it was a Godmanchester man, EBENEZER SEWARD, who was once my gardener—a man of considerable intelligence. He found the plant in his cottage garden and brought it to me, and at my suggestion sent it to Messrs. HENDERSON & SONS. He named the plant himself 'Golden Feather,' and disposed of his stock to Messrs. HENDERSON. He is still living as gardener to P. E. TILLARD, Esq., of Godmanchester, near Huntingdon. I saw him last month, and had the pleasure of telling him that I had seen his Golden Feather in common use in France and Italy."

— **THE IRISH SEEDS ACT.**—At the instance of Mr. E. D. GRAY, M.P., Lord Mayor of Dublin, the local Irish Relief Committees have begun to collect statistics as to the increase of local rates in the districts under the operation of the Seeds Act passed last session. Mr. GRAY intends to propose that the districts receiving grants under the Bill shall receive aid in the repayment of the advances from the Imperial Exchequer, on the ground that it would be unfair to increase the local taxation during the prevalence of the distress.

— **THE KEW ARBORETUM.**—By inadvertence in a recent issue we stated that no plan of the arboretum, available for public use, existed. In this we were in error. The last edition of the *Guide to the Royal Gardens* (MACMILLAN, 1878) does contain such a map, but one that, for students' use, requires amplification and further explanation.

— **MACULATED GLOXINIAS.**—This is, perhaps, the most fitting designation for a strain of Gloxinias of great delicacy and beauty that we have become familiar with during the past few years. A group of these was shown by Messrs. JAMES VEITCH & SONS

at the meeting of the Royal Horticultural Society on Tuesday last, and we were glad to note the substantial advance that is being made, not only in the brightness and variation of the colours forming the spotting, but in the unique and novel character of the markings. The varieties are nearly or quite all erect-flowered, which is desirable in order to survey the markings. A few of the leading varieties were as follows:—Lady Marriott, with lively rosy-pink markings on a white ground, and broad even white margin, very delicate and pretty; Christophe Colomb, rich purple, most charmingly and delicately maculated to the edge, which is of a paler tone than the throat; Professor Griesbach, very delicately inlaid with rosy-purple, bright and effective in colour, white margin; Prince of Wales, frosted with purple, and having a broad white edge; Zenobia, having the surface delicately maculated with purple and orange, broad white margin; Jeanne Meuret, having a slight spotting and white edge; Gaze Lilas, with purple surrounding the throat and lively purple on the lobes, very fine and distinct; Paul Deroulide, having a distinct margin of mauve, the throat maculated with the same; and Charmé de Lutice, maculated with magenta more heavily than in the case of the varieties generally, but yet very handsome and distinct. What is wanted in the case of these most pleasing Gloxinias is more stoutness in the flowers. There is form, but they lack substance. This will be certain to come in time, but their richly jewelled blossoms, with their delicate nebulous tracings, are so attractive that they will be certain to find admirers, and receive the attention they so well merit.

— RHODANTHES IN POTS.—The beauty of the pots of Rhodanthes now being brought to market deserves a passing notice. The varieties mostly grown are *Manglesii* alba and maculata, affording an excellent contrast, the one being white, the other bright rosy-pink. The seeds are sown in January or February in the 48-sized pots in which they are marketed, placing them thinly in the soil, and when large enough the plants are thinned out to some eight or ten, and by May they are well in flower, and carry dense heads of bloom. We have lately seen pots of the two varieties named, on the plants forming which can be counted fifty or sixty opened blossom-heads, besides many in bud. When well-grown the plants are well furnished with leaves quite to the base of the stems. As the plants are grown on in a strong heat they need to be well hardened off before they are brought out for sale, and there is reason to think some of the growers are not quite careful enough to harden sufficiently, the consequence being that the foliage becomes withered, and a good deal of the beauty and symmetry of the plants is thereby lost. When well prepared for exposure pots of Rhodanthes make excellent subjects for the window, and they remain for a long time in good condition. After that quality has passed away the flowers can be cut, carefully tied away in bunches, and kept for winter decoration. The Rhodanthes are charming and useful subjects for bouquets; indeed, they are very useful flowers, that should be largely grown by gardeners.

— COMPLIMENT TO MR. GOAD.—On Saturday last Mr. WILLIAM LEWIS GOAD was entertained at a dinner at Freemasons' Tavern, Great Queen Street, W. J. NUTTING, Esq., in the chair, D. SYME, Esq. (Edinburgh), Vice. Among the gentlemen present were R. T. MACINTOSH (Edinburgh), JAMES COWAN, PETER BARR, JOHN FRASER, DAVID ALLISTER, S. A. DEGRAAFF (Haarlem), A. BARNART (Leyden), FRANK F. TOOLE, JOHN HORSBURGH (Edinburgh), and several others. During the evening the Secretary, SAM. McDOWALL, Esq., presented Mr. GOAD with a handsome Malacca cane and a gold chain and locket containing portraits of his (Mr. GOAD's) two daughters. The usual loyal and other toasts were drunk, and altogether a very "joyous" evening was spent.

— STOPPING LATERALS ON GRAPE VINES.—In a letter to us Mr. WILLIAM EARLEY raises the question of the propriety of this practice and the time at which it should be done. Mr. EARLEY argues that as the activity of leaves and buds of the Vine is developed before that in the roots, which are formed in consequence of the latter, the practice of suppressing the young leaves is of doubtful utility. The point is undoubtedly one of importance, but so far as the

first development of roots and leaves is concerned, it must be remembered that it is the nutriment stored up in the old cane which furnishes at first the necessary material for the growth of both.

— ROYAL HORTICULTURAL SOCIETY.—We are glad to note that the *conversazione* held in the large conservatory on Wednesday was a very brilliant affair, and, thanks to a fine warm evening and a good company, passed off very satisfactorily.

— VINE LOUSE IN SICILY.—Mr. Consul ROSE states, in a despatch from Palermo dated May 12, that according to a report made by Professors DODERLENI and PATERNO to the President of the Agricultural Society of Palermo—1, the Phylloxera has attacked the Vines of Riesi since 1872; 2, that these Vines, though diseased, present externally a flourishing state of vegetation; 3, that for eight years there has been no falling off in the yield of Grapes, and that the Vines would continue to give abundant crops of fruit for an indefinite period without their being totally destroyed; and, 4, that the comparatively slow progress made by the disease is attributable to the nature of the soil, to the special properties of the Sicilian Vines, and to the system of plantation and culture.

— LINNEAN SOCIETY.—At the anniversary meeting of this Society, on the 24th inst., Prof. ALLMAN was re-elected President, Mr. CURREY became Treasurer in place of Mr. GWYN JEFFREYS; and Messrs. B. D. JACKSON and F. ALSTON were elected Secretaries in the room of Messrs. CURREY and ST. JOHN MIVART. The President's address took the shape of a review of the vegetation, indigenous and cultivated, of the Riviera. The financial position of the Society is satisfactory.

— THE LABURNUM.—Amongst all our ornamental flowering trees the Laburnum is assuredly in the foremost rank. No garden seems complete without its glorious racemes of golden-yellow flowers. In the Arboretum at Kew the typical plant is altogether outshone by its varieties, *Parkii* and *autumnalis*, both of which have much finer flowers than the commoner and older form. The variety called *quercifolium* is a rather peculiar one, each of its leaflets being sinuated and bearing a more or less fancied resemblance in outline to an Oak leaf.

— PUBLICATIONS RECEIVED.—*Portugal, Old and New*, by OSWALD CRAWFORD (SAMPSON, LOW & Co.).—*The Amateur Gardener*, by Mr. LOUDON, edited and revised by W. ROBINSON (FREDERICK WARNE & Co.).—*Bee-Keeping for Amateurs*, being a short treatise on apiculture, on humane and successful principles, by THOMAS ADDEY (Bazaar Office, 170, Strand).

— THE WEATHER.—General remarks on the weather during the week ending May 24, issued by the Meteorological Office, London:—The weather was fine and moderately clear during the first two days, but quickly became less settled, and from the 22d till the close of the period the sky was dull or cloudy in all parts of the kingdom, with rain in several places, especially in the N. and N.W. Temperature was a little above the mean in "Scotland, E.," and "Ireland, S.," and equal to the mean in "Ireland, N.," "England, S.W.," and "England, N.E.," but slightly below it in all other districts. The highest of the maxima (77° at Southampton, and 78° at Prawle Point) occurred on the 20th or 21st. At the commencement of the period the nights were rather cold, and in the central and eastern counties of England one or two slight frosts were registered. The rainfall was a little more than the mean in "Scotland, W.," and equal to the mean in "Ireland, N.," but in all other districts the fall was very slight. Bright sunshine shows a decided increase in all parts of the country, but was more prevalent in the south-west of England and south of Ireland than elsewhere. The wind on the 18th was easterly in nearly all parts of the country, but a southerly to a south-westerly breeze had appeared at our more northern stations, and gradually spread to all our coasts. In force the wind was light or moderate during the first few days; from the 22d till the end of the period, however, it blew freshly or strongly generally, and occasionally reached the force of a gale at some of our north-westerly stations.

## Home Correspondence.

**New Hybrid Rhododendrons.**—I think a short notice of some Rhododendron blossoms received from Mr. C. Scott, of the Lawson Seed and Nursery Company, may be interesting to your readers. The blossoms are the produce of a cross between *R. Aucklandii* and one of our ordinary hardy varieties, and the remarkable feature about them is the intensity of the scent, quite as powerful and fragrant as that of *R. Aucklandii* itself, if not more so. The plant withstood, last winter, in the Edinburgh gardens, a temperature of 2° below zero, without injury to the blossom-buds. I have long hoped to see a race of hardy Rhododendrons exhaling the delicious odour which many of the tender species possess—a result to be obtained, as often stated in your pages, by crossing with the magnificent species introduced by Sir Joseph Hooker and others from the Himalayas. Hitherto I have seen none of this type which can properly be called hardy; but Mr. Scott seems to have solved the problem at last, and deserves the thanks of all Rhododendron growers. *J. H. Mangles, Valewood, Haslemere.*

**Passiflora racemosa.**—This though an old inhabitant of our plant-stoves is but seldom met with in a really creditable condition—a circumstance that is much to be regretted, as it is a plant well worthy of careful culture, especially as a stove climber. I lately saw a fine healthy and well grown example of it growing in one of the plant-stoves in the gardens at Eridge Castle, near Tunbridge Wells. The plant in question was trained along the roof of the house, thus showing off to advantage its beautiful racemes of bright scarlet flowers. *T. W. S.*

**Spotted Mimulus.**—It may interest some who wish to have a beautiful flower-bed somewhat earlier than can be had through the usual summer bedding plants that I have a bed of these containing about 300 plants put out the first week in May, just as the first flowers were about to expand, and which have been all in beautiful bloom since. No keen cold winds or white frosts have injured them, as these *Mimulus* of Clapham's strain are very hardy. The colours and markings are legion and most beautiful, the flowers large and rounded, and the plants moderately dwarf. These are from seed sown in an ordinary greenhouse in January, and had previously to planting out been pricked off only once. If any one will try a bed of these next year and dibble in Asters amongst them they will have no cause to complain of the result. *A. D.*

**Double Pyrethrums.**—Among hardy border plants now blooming none are more showy and useful than the double Pyrethrums, of which there is great variety, embracing nearly all shades of colour from pure white to deep crimson, and as the flowers are as good in form as *Chrysanthemums* or *Asters*, they are of great value for cutting. Then they are much appreciated for this purpose, as they not only look exceedingly well dressed in vases but they pack safely and last long fresh in water, and as they force readily they may be had in early to help to embellish the greenhouse. In starting with these Pyrethrums, it is best to get young plants in pots, and then turn them out at once in the borders where they are to stand, but before doing this it is advisable to prepare the places for them by digging in some rotten manure, which will help materially in giving them a good start and strengthen them after. Should an increase be desired, it may easily be effected by division when the plants get large enough, the spring being the proper time for carrying it out, but it should be done early, as then there is no fear of losing them through the cut part rotting, as would be the case when growth is less active. I have tried raising them from seed, but never yet obtained any in that way worth having, the flowers that came being very poor indeed when compared with any of the named kinds, most of which are all that can be desired. *J. S.*

**The Turnip-fly.**—There is not a farmer in England who at the present is not dreading the attack of that pest, the Turnip-fly. If he will only drill in a small quantity of peat-charcoal along with his Turnip and Mangel seed he will find that the young plant rushes up into the broad leaf so quickly that the crop will be secured. If the drought becomes exceptionally severe a sprinkling of this charcoal on the little plant will also save it from being eaten up. I have seen the effects of it during the past three years, and think that your readers should know of it. The material is prepared at the Cowle Works, near Doncaster. *A. W. E.*

**Advertising Exaggerations.**—It is a pity for enterprising tradesmen to damage their business by careless exaggeration. In the *Gardeners' Chronicle* of May 22 is an advertisement stating that, at a cer-

tain establishment, there are "probably half a million of Primulas, Cinerarias, &c." Now, taking the length of the two houses as given at 100 feet run, and assuming a stage on each side of say, 4 feet wide, we have a total area of 1600 feet available for the cultivation of these seedlings ( $100 \times 2 \times 4 \times 2 = 1600$ ). Then, if we allow 150 plants to occupy one square foot of surface—that is, less than 1 square inch apiece—the total result amounts to only 240,000 ( $1600 \times 150$ ), or less than half the number so lightly named by the advertiser. In this calculation no allowance has been made for the loss of space due to the thickness of the boxes or room between them, still less for the further loss of space if the seedlings are in pots; in the latter case only three-quarters of the number could be accommodated without reckoning for the pots themselves. I do not make these remarks in any captious spirit, but merely to deprecate assertions being made, which are not only insusceptible of proof, but are absurd on the face of them. *J.* [No doubt exactitude is always desirable, but when, as in this case, our correspondent sums up 240,000 at about a square inch apart, and when it is remembered that at certain stages (not indeed over the whole area, but in parts of it) the square inch might include ten, fifty, or even 100 plants, there is not so much exaggeration after all. *Eds.*]

**Green Frogs in the Orchid-house.**—After a trial of some weeks I find the green frog one of the best remedies I have yet adopted for the destruction of vermin which infest the Orchid-house. Some weeks ago I purchased two dozen of this beautiful green frog from Jamrach, dealer in wild animals, London, and let them loose among the Orchids. Since then I have carefully watched their movements and have seen them "gobble up" all sorts of pests. I have examined their "droppings" and found the remains of the weevil, other beetles, woodlice, and ants. They possess one great advantage over the common toad in the Orchid-house, as they not only travel over the highest plants, but over the whole interior surface of the house in search of their prey, never injuring the most delicate shoot or flower-stem. The few ants we had in one house previous to the introduction of the frogs are now nearly exterminated. On my recommendation Provost Russell, of Falkirk, and Mr. Smith, Bentham Park, Stirling, procured a few dozens of them, and they are highly pleased with their services. I would advise all Orchid growers to give them a fair trial. Their presence gives an additional interest to the Orchid-house. *Alex. Paterson, M.D., Fernfield, Bridge of Allan, May 24.*

**The Orchids at the late Manchester Show.**—In your report of the Manchester show, just now closed, in referring to the Orchids you state that the premier amateur prize falls to a gentleman who on this occasion for the first time adventures on the trying number of fifteen. In this matter I find you have made a mistake, and feeling sure you will be glad to have an error rectified, I refer you to the report in your paper of the show for 1879, where at p. 732, vol. xi., you will find that the same gentleman was on that occasion awarded the 3d prize. This disposes of the fact that he has won his spurs on his first appearance. Now, whilst writing of the matter of Orchid showing, it is well known that exhibitors are apt to grumble and to be dissatisfied when they have to take a step downwards, more especially when (to them) there are no valid reasons why it should be so. I know one can utter his thoughts and opinions, and however just they may appear to himself, it is difficult to prove to others that the man who has a grievance has always justice to back him up in it, and that a complaint may be made, and, because it is not rectified or the cause removed so that it may not occur again, such complaint appears to have been made unnecessarily. What I fail to see, however, in this case is—and this is the question I ask—Is a collection of fifteen plants strengthened or weakened by the admission of three plants of a sort? Separate names, as varieties, of course, may be affixed, but the distinction in this case was so slight that had all forms been in one pot no one could have objected to them. I answer for myself, that I consider it is weakened. Again, a collection in which there is not a Vanda, Aerides, Saccobolium, or Phalenopsis, with the exception of a piece of Saccobolium ampullaceum, is weaker, I think, than one in which two or more of these genera are represented. I know the schedule does not state the plants need be distinct, the prizes being awarded for fifteen Orchids, nine, &c.; but previous schedules have had the word "distinct" inserted, and those who showed distinct plants I consider abided by the spirit of the schedule, whilst, doubtless, they should have kept to the letter. In this respect the compilers of the schedule will, it is to be hoped, be a little more careful, and state under what conditions the plants must be staged—if duplicates are to be admitted, and whether preference will be given to the greater variety combined with excellence and skill, or whether show, colour, and effect only are to be taken into

consideration. I can remember, only a few years ago, when a gentleman staged a large number of Cattleya Mossiae, among them being many choice and superior forms: a slight acknowledgment, however, was all they succeeded in obtaining. Again, in the premier award for nine the judges should have thought seriously, and not have stamped with approval the practice you have condemned—shallow green boxes 2 feet or more square filled up with twelve, eighteen, or twenty plants. If this is admissible, why stay at 2 feet? If it is wrong, why award it the 1st prize? I consider the gentleman who was placed 2d has a just cause of complaint, and may well feel aggrieved. If the bedding-out system is thus to be patronised and approved it will be time to give over growing specimens and go in for quantity only, and order boxes from the joiner instead of pots from the potter. If making up is admissible—or, rather, since the practice is so often adopted, whether the plants come from far or near—let it at least be done in such a manner that an appearance of naturalness is evident in the plants staged. If the practice is not to be tolerated let it be so stated in the schedules, and let prizes be offered to single specimens, that is, plants that have at least been twelve months in the pot or basket; and let a prize also be offered to such as are made up for the purpose. Doubtless the show managers are ever anxious to make a fine display; they should have a thought also to the advancing and furthering of the object for which shows were originally intended—to increase and extend the love and interest of the public in all that pertains to horticulture. More may perhaps have to be said on these matters generally, meanwhile exhibitors must observe a watchful attitude. *An Exhibitor.*

**Boilers.**—We have at present six large boilers heating 7 miles of hot-water piping, five of them saddles, 9 feet long, one Trentham, 12 feet long. My employer is desirous of substituting three large boilers a distance off, so as to get rid of the smoke, which is a great nuisance. Some of the houses will be 100 yards from the boilers, and most of them quite 50 feet above the boilers. Will some of your correspondents kindly give me their advice as to what is the best and strongest to stand the pressure and heat quickly and economically? *Eromeguar.*

**Substitute for Box Edgings.**—I saw at The Wilderness, Reading, recently, an excellent kitchen garden edging composed of a raised ridge of soil on either side of the path, and planted along the top with Sedum glaucum. This can be cut-in once a year with a spade, and will last for a long time. S. lydium also makes a good edging. I have found the tuft Wire-grass, Festuca viridis, to make a capital hardy and enduring edging, needing the flower-stems to be trimmed off only once a year. It is solid, yet graceful, and far more pleasing than are the stiff formal lines of clipped Box. *D.*

**The Effects of the Winter upon Apple Trees.**—I send herewith sample branches taken from Apple trees in a market garden near here which exhibit more forcibly than words can tell how destructive the severe frost of the past winter has proved to them. The garden contains about 1000 Apple trees in various stages of growth, varying from fifteen to three years planted, all up to the present remarkably healthy and clean, producing good crops of fine fruit and kept in good condition by careful culture. The trees are planted in rows of forty, and it is a pitiable sight to look along them—to see King of the Pippins, half-standards, some 14 feet in height, almost dead throughout; Wellingtons, almost as bad; Yellow Ingestres and Lord Suffield half-dead, the latter in some cases quite so; the favourite Early Julien also has suffered severely, together with Royal Russets, sample wood of all of which is sent. It is observable that many branches had burst both leaf and bloom buds as usual before they collapsed; indeed the real damage has only been just made fully obvious, as now probably the worst is visible. The injury is not confined to the wood of the past or even two preceding years, as many will be perhaps disposed to imagine might be the case, but is seen in growth four and five years old. The action of the frost has been peculiar, as in seen in the samples sent, the wounds inflicted resembling bruises as though produced by a blow, the wood on one side of the stem shrivelling and decaying for a length of from 1 inch to 4 inches, just as a Potato will decay in spots when affected by the fungus. The garden has a south-western aspect, the soil is still but not wet, and on it beneath the Appletrees, Gooseberries, red and black Currants, and Strawberries thrive well. The rows of Gooseberries, perhaps, cannot be excelled in Middlesex for size, healthiness, and a good fruit crop. There is a good natural fall to the side, and water will not lie upon the surface. But what calls for special comment is that whilst half a dozen popular market kinds of Apples have so heavily suffered—so much so, in fact, that it is doubtful whether hundreds of fine trees will ever recover—yet there are another half-a-dozen

equally fine-favoured kinds that are not only entirely uninjured, but are promising to produce abundant crops of fruit. These are not growing separate, but amidst the others, and therefore subject to the same temperature, soil, and treatment. Keswick Codlin, Cox's Orange Pippin, Stone's Pippin, Duchess' Favourite, Warner's King, and Blenheim Orange—all these look as well as Apple trees possibly could look, but unfortunately the Kings, Wellingtons, Ingestres, and Suffields—ominously high-bred names—are in the majority, and the loss resulting through these and the others will be heavy. A few trees of the Scarlet Nonpareil, also severely hurt, are well matched by a few of the new Hawthornden, which are in fine healthy condition. This form of mischief is considerable in some other gardens, whilst in yet others the trees have generally escaped. Old trees have suffered but little: in my own garden I have a row of about fifty trees some ten years old, all different kinds, and full of robust growth, the soil here also being stiff and clayey. Out of the number only Northern Spy, Lord Suffield, and the old Hawthornden have suffered, and in the same way, as an example of wood from the former will show. With the exception of a young shoot here and there, all the rest are as healthy as can be desired. *Alex. Dean, Belfont.*

**Autumn Strawberries.**—I can fully corroborate all that Mr. Hinds says on p. 662, in favour of autumn Strawberries. A quantity of Vicomtesse Hélicart de Thury were planted out here last year early in the summer, and bore a first-rate crop of fruit in the autumn, which was by no means a favourable one for them in this part. This spring they are throwing up a large quantity of flowers, and bid fair to be the best piece of Strawberries we have, although all are looking exceptionally well. We find Vicomtesse H. de Thury to be the most useful variety of Strawberry we have; it forces well. Many of our fruit this year have weighed over an ounce each, and we have had sixteen fine fruits on a plant in a 6-inch pot, in many instances. It comes in for use quick, and after forcing, if planted out carefully, it yields another full crop in the autumn, without interfering in any way with the next year's supply. *W. H. Divers, Burghley.*

**Rheum nobile.**—We have a plant of the Sikkin Rhubarb, Rheum nobile, Hook. f., in flower here at present. It was raised from seed sent by Dr. King, of Calcutta Botanic Garden, about seven years ago. For several years it has grown in the open border without any protection, and has thus proved itself to be perfectly hardy. It is about 2½ feet in height, and is really an object of great beauty. I believe this is the first instance of its having flowered in Europe. It is a plant well worthy of cultivation. *J. Sadler, Royal Botanic Gardens, Edinburgh, May 22.*

**The Effects of the Dry Weather on Trees and Shrubs.**—Trees and shrubs, especially those that have been removed within the past twelvemonths, are now suffering severely, not so much from dryness at the root as for want of atmospheric humidity. The earth is also becoming dry in many places and the continued aridity of the atmosphere along with it will make unceasing work for gardeners: even heavy dews are absent, and upon the whole the prospects are growing gloomy. Tender trees, such as variegated Maples, are starting into growth but weakly, and many other trees and shrubs indicate that their condition will soon require attention. Where mulching can be done without being unsightly on lawns it will render great assistance to newly planted trees and save much labour in watering. *H.*

**Carpet Beds.**—During the incessant wet of last year, when flowering plants of all kinds, including the hardiest herbaceous plants, looked seedy and uninviting, the style of bedding popularly known as "carpet bedding" was singularly attractive among so much that was gloomy and disappointing. No one could visit such representative places as Hampton Court or Battersea Park without being struck with the incomparable and superlative beauty of those chaste designs aglow with so many shades of colours which are surely more refreshing to look upon than a painted scene in the distance, which hundreds frequently flock to see. We had an extreme of wet last season, and the weather prophets predict the other extreme during the present year. It will, therefore, be wise not to forget that the most attractive of carpet bedding plants, viz., Alternantheras, put on their best dress during plenty of sunshine and warmth. Succulent plants, too, assume that beautiful tinge of glaucous green in dry, sunny weather which is not enjoyed in wet seasons. With regard to carpet designs one cannot help being struck with the simplicity of many that are to be seen in our public parks, and it is more noteworthy still that simplicity of design invariably gives the best effect. I wish this fact could be more forcibly impressed upon that large class who will not think for them-

selves. There can be no possible objection—but the reverse—to copying a design where there is room to work it out upon a scale large enough to produce masses of colour which shall be clear and distinct, and where the eye can trace the meaning of the design from beginning to end. But, unhappily for the repute of the system, there are some who think that intricacy of design displays depth of ability, hence we have designs which are only suitable for large places squeezed in miniature fashion into an area where the most profound and erudite Greek scholar would be puzzled to determine the original idea of the inventor. We see initials of persons and places draped in various colours in a way that betrays the most shallow conception of anything chaste or original, in fact a meaningless labyrinth of tortured geometry. For small beds in a private garden three colours in a simple design will yield infinitely more pleasure than double the number would do in the same space. In large beds, as at Hampton Court, a great variety of plants are introduced into one design, but condensed masses of telling colours predominate in the principal figures, and the smaller ones of less striking colour only help to tone down the effect. *Carpet Bedder.*

#### Tradescantia zebrina as a Bedding Plant.—

It may not be generally known by gardeners that this plant, which is chiefly grown in the plant stove, is eligible for purposes of bedding, but that it is a most satisfactory plant when tastefully employed there can be no doubt. Its beautiful zebra-like markings are never produced so truly in the heat and shade of a warm house, as when planted out in the open in a free open soil, and fully exposed to sun and light. It will prove useful for carpet-bedding or for margining beds where dark coloured plants are required for arranging with light coloured plants. *H. H.*

*Wistaria sinensis.*—Your editorial remarks respecting standard *Wistaria sinensis* recalled to my memory that some years since there used to be (and may be still for what I know) specimens of it in the form of pyramids, or standards, growing in the pleasure grounds at Knole Park, Sevenoaks, where they had in the spring months a very graceful and pleasing appearance. It would be well if this showy climber was oftener used in this way, for it is equally as well adapted for such purposes as for covering walls and buildings, for which it is commonly used. Few shrubs can excel or even equal it for effect when in blossom. There were also at Knole specimens of the Judas-tree (*Cercis Siliquastrum*): this I think, although old, is rare, and seldom planted now, for I cannot remember seeing it at any other place. It is a treat now-a-days to go over old-fashioned pleasure grounds, where you can meet with old slighted trees and shrubs. *Thos. Coomber.*

*Richmond Late White Broccoli.*—Having seen in the *Gardeners' Chronicle* much controversy respecting the hardness of Broccoli, I send for your inspection a sample of Richmond Late White. This Broccoli was sent out some twenty years ago, and withstood the severe winter of 1860, and at that time was fully commented upon in the columns of your journal as one of the hardest and best in cultivation. I have only commenced cutting this variety to-day (May 24), and out of a flat of 6000 there are 95 per cent. living, which must be considered good when growing on a north-east aspect. *Hiram Shaw, Richmond Hill Nursery, Sheffeld.* [Any variety which has withstood the weather of the last winter must have something to recommend it, but yours is neither so large nor so white nor so handsome and regular a sample as that shown last Tuesday at South Kensington, which was considered to be a good selection of Cattell's Eclipse. *Ets.*]

*Setting Peaches.*—It would be interesting to know what is the nature of the soil in which Mr. Smith's Peaches are grown. My impression is that he must be much more favourably situated for Peach and Nectarine growing than are many gardeners. By reading the pages of the *Gardeners' Chronicle* it may be seen from time to time that Peaches and Nectarines do not do in all soils and places alike. My own observation and experience have also taught me that such is the case—that however well the trees may be done in some places the results are not always so satisfactory to the manager as may be desired. Some soils are naturally cold and retentive, and in such Peach trees may exist between life and death, while in more gravelly soils the Peach will thrive and do well. The wonderful variations of soils throughout the country to my mind explains the causes of success or failure in Peach growing. On reading Mr. Smith's letter I had the impression that it may lead the proprietors of some gardens to infer that if such results can be obtained by "good management" in one place such success should be gained in all others alike; hence it is that I have been led to make these few remarks thereon. *E. Williams.*

*Choisya ternata.*—In your account of *Choisya ternata* (p. 626) you have omitted to notice one of its chief recommendations, the pleasant and delicate scent of the flowers. It is completely hardy: I have a good plant on a south wall that has stood quite uninjured during the two last winters without any protection whatever, so that I have no doubt it will do very well in the open ground. It strikes so readily, that it will probably soon become a very common and very favourite hardy flowering shrub. The flowers (and especially the buds) are so similar to those of the Orange, that I have been told they are commonly sold in Paris as substitutes for the Orange. *H. N. Ellaombe, Bilton Vicarage.*

*Campanula persicifolia.*—This is one of the finest of our old herbaceous plants, and one which

FIG. 121.—DOUBLE WHITE CAMPANULA PERSICIFOLIA.

is frequently met with in cottagers' gardens in one or other of its several forms. It is easily grown in good light garden soil, provided it is not too dry and hot, in which case the development is checked, and the plant dwindles and eventually dies. The leaves are long and narrow, like those of the Peach tree, whence its name. The flowering stems are erect and branched, from 2 to 3 feet high, according to soil and situation, and bearing during the early summer months a profusion of its showy bell-shaped flowers, which are broad and shallow, and either white or purplish-blue. We have said that there are several forms of this fine old plant in cultivation. The one we figure (fig. 121) is the double white, a very fine thing, which was

shown recently at South Kensington by Mr. H. Cannell, of Swanley. The colour is pure, and the centre well filled. Mr. Cannell's plants had been evidently forwarded under glass, and hence we may conclude it would form a useful decorative pot plant, and an excellent subject for cut flowers. There is a double blue of similar character, and besides these four there is another called coronata, a white-flowered sort, in which the calyx becomes amplified and coloured white like the corolla—in fact, a hose-in-hose variety. *T. H.*

*Remarkable Yew Trees.*—A few months since you asked for information as to any remarkable Yew trees in the country. There is a fine one in the churchyard of Stedham, in West Sussex. I found its girth, at about 18 inches from the ground, to be 28½ feet; higher up the bole swelled out, but the Ivy prevented the measurement from being taken. The tree is in full vigour although hollow, but it is to be feared that the Ivy will soon injure it if not checked. *H. A.*

*The Weather.*—Every one familiar with the practical difficulties of agriculture or horticulture becomes painfully aware of the wonderful potency of the weather as a factor in production or non-production. The same truth is most powerfully illustrated in the able paper and speaking diagrams of Mr. J. C. Morton in his "Forty Years of Agriculture," to which you called the attention of your readers last week. Neither do we need to go back more than a week to find powerful illustrations of the same truth. Notwithstanding the severity of the past winter, and the dryness and low temperature of this spring, the more than average amount of sunshine had fostered our growing crops into a flourishing condition, so that our gardens had a flourishing look about the middle of May. The Potatoes that had lain dormant longer than usual had at last burst through the soil and were growing fast; Cauliflowers—so carefully nurtured this year in the almost entire absence of Broccoli—had been relieved of their shelter of glass; Peas were in full flower, kidney and runner Beans several inches high; the wall trees, if not heavily laden with fruit, had set the few flowers that showed, and were clean and of healthy growth; the shrubs and trees were in full leaf, and many of them also in flower, on Whit-Monday. The day was beautifully fine, the night clear and cold, but not more so than others that had preceded it, until between 4 and 6 o'clock on the morning of the 18th, when a ground frost seemed to shoot along the surface of the earth, blasting and blighting all it touched as with the very finger of death. The Potatoes were cut down, and all other tender vegetables, plants, and flowers were crippled or destroyed. The blister appeared on the wall trees in the rear of the wave of extreme cold, just as if it had mechanically blistered them. The plants and flowers not blackened to death have drooped and languished ever since, and all the evils of the frost have been aggravated by a series of cold gales of almost unexampled severity. As usual after such severe frosts, the sky became overcast with clouds, and a few drops of rain fell. Then the wind arose and drove the rain-clouds right over the crippled vegetation and the thirsty earth, and it has blown with such severity as to tear off the green leaves of Apple, Pear, and other trees by wholesale, and batter and tear many of those left; but up to the evening of the 24th no rain has fallen, and the weather is dry and harsh, more like October than May. It could not well be worse for bedding-out. But apart from its influence on this department, the harsh, ungenial weather must seriously damage all the crops of this season. The sharp frost of Whit-Tuesday can hardly have failed to have seriously thinned the Cherry, Plum, and Apple crops. In early districts it has destroyed all the forward bloom of the Strawberries, which looked so well. The centres of the fully-expanded flowers are quite black—a sure proof that the embryo fruit is destroyed. The suddenness of this frost seems to have intensified its destructive energy: it also seemed to hug this more closely than most frosts. The latter is a curious subject, that has hardly received the attention it deserves from practical men. Doubtless the zones of vegetation are determined by the zones of temperature, and as altitude is to a limited extent under our control, and the most intense cold seems as a rule within 6 feet of the surface, it would be wise in choosing sites for gardens to elect the highest sites available. The last winter furnished us with some curious illustrations of altitudinal thermal lines in the case of some of our trees and shrubs. Two *Pinus insignis*, for example, had most, in one case all, their bottom branches destroyed to a height of about 5 feet. Beyond that altitude they are uninjured. Query: had they been raised on an artificial mound would the entire tree have escaped—or does the mere proximity to the ground line depress the temperature, partly at least, independent of the altitude of the position? *D. T. Fish.*

## Reports of Societies.

Royal Horticultural: May 25.

SCIENTIFIC COMMITTEE.—Sir J. D. Hooker, K.C.S.I., in the chair.

*Gall on Eucalyptus*.—Mr. MacLachlan reported that the spindle-shaped gall, sent by Baron Von Mueller, was probably the work of a cynipid, which had perforated the young flower-buds. Some of the galls contained a larva of a dipterous insect, itself attacked by a parasitic hymenopterous insect.

*Colchicum as a Cattle Poison*.—Dr. Masters showed specimens of *Colchicum* from a field in Lincolnshire, where cattle had died in consequence, it was believed, of eating the foliage of a plant recognised as *Colchicum autumnale*.

*Dionaea*.—Messrs. Veitch showed a specimen with a double lamina to the leaf.

*Cytisus Adami*.—Sir Joseph Hooker showed a specimen, showing the intermediate *C. Adami* and one of the parent forms, *C. purpureus*, growing on the same shoot.

*Tulip*.—Col. Trevor Clarke showed a large flower of *Tulipa*—originally grown by Mr. Jas. Carter, to whom it had been given by Mr. Strangways.

*Puccinia Violarum*.—Mr. MacLachlan exhibited leaves of the Violet affected with this fungus in a young state.

FLORAL COMMITTEE.—Dr. Denny in the chair. The most remarkable plant shown to-day was a magnificent example of *Odontoglossum vexillarium*, shown by G. Nevil Wyatt, Esq., Lake House, Cheltenham (gr., Mr. Spicoc), a genuinely grown specimen, with fifteen spikes of flowers, six to eight on a spike, fine in size, and a nicely coloured variety. The committee recommended the award of a Silver Medal. Zonal Pelargonium West Brighton Gem, a remarkably free-flowering dwarf scarlet, was shown by Mr. W. Miles, nurseryman, Hove; and Mr. F. Geary, gr. to the Earl of Portsmouth, Eggesford, sent examples of a golden variegated Birch, which is reported to have remained constant since 1876, when it was found as a sport on *Betula alba*. Messrs. James Veitch & Sons contributed, amongst other things, a very pleasing group of spotted *Gloxinias*, about which more is said in another column. From Messrs. James Garaway & Co., Durdham Down Nursery, Bristol, came a good specimen of a very striking Golden Horse Chestnut; and Messrs. John Laing & Co. contributed a small group of tuberous-rooted *Begonias*, all of fine quality, and a collection of herbaceous *Calceolarias*. Messrs. James Carter & Co. showed examples of a *Minulus* named Ruby, with flowers of good size, ruby-red in colour, but with an orange throat spotted with crimson. Mr. J. H. Goodacre, The Garden, Elvaston Castle, showed some small flowering plants of what appears to be a minor form of *Stephanotis floribunda*, which has the reputation of being a much more profuse bloomer than the ordinary type, from which it also differs in having much smaller leaves. From Chiswick Mr. Barron sent a well-flowered and very select group of varieties of *Nerium*; and also two sets of cuttings of various plants, the one struck in sea-sand, the other in the ordinary silver-sand, and which plainly showed the advantage of using the former in preference to the latter, the rooted plants being altogether stronger and better coloured.

In addition to the usual display in the Council-room there was a capital lot of plants staged in the Western Arcade, most of which were destined to remain for the *conversazione* on the following evening. The most striking group of all was one of pot Roses, shown by Mr. Turner, which consisted of magnificently flowered plants ranging in size from good half specimens to the monster Charles Lawson, which must be quite 7 feet high and the same in diameter. Grand as have been the displays of pot Roses at Kensington before, it is doubtful if any surpassed these in quality; and the award of a Large Gold Banksian Medal was a none too flattering recognition of their merits. Mr. B. S. Williams and the General Horticultural Co. (John Wills), Limited, received the awards of Gold Medals for large and tastefully-arranged collections of fine-foliaged and flowering plants of rare quality; and Messrs. W. Cutbush & Son had a Silver Banksian Medal for a neat group of fine-foliaged and hard-wooded flowering plants. Mr. J. R. Bird, gr. to J. A. Causton, Esq., Lodgemore, West Dulwich, received a Silver-gilt Banksian Medal for a large group of herbaceous *Calceolarias*, and a dozen admirably grown specimens of standard tree *Mignonette*. Mr. Miles, of Hove, had a Bronze Banksian for a large group of Pelargonium West Brighton Gem and *Mignonette*. Mr. Aldous contributed a small group of decorative plants; and from

Chiswick came a large and most interesting collection of Cape Pelargoniums, a good collection of *Gloxinias* and other plants, including the fine old *Saxifraga pyramidalis*.

### NEW PLANTS CERTIFICATED.

First-class Certificates were awarded to Messrs. James Veitch & Sons, for *Trichomanes parvulum*, *Lastrea Maximowiczii*, *Yucca filamentosa aurea elegantissima*, *Clove Carnation* Sir Archibald Grant, a very distinct variety, with well-formed self, bright claret-coloured flowers of great substance; and *Erigeron pulchellus*, a low-growing species, with bright orange-coloured composite flowers. To Mr. William Bull, for *Cereus C. M. Hovey*, a large and lovely violet-purple coloured flower, with a bright crimson bar down the centre of the petals, a variety of American origin. To Mr. B. S. Williams, for *Pteris internata*, a West Indian plant near *Pteris mutilata*, and possibly a natural hybrid between that plant and *P. heterophylla* which it closely resembles in the younger stages of its growth; *Croton Warreni*, a handsome and striking novelty; and *Nepenthes atrosanguinea*, a seedling variety with long, deep blood-red pitchers, streaked with greenish-white. To Mr. G. Braid, Winchmore Hill, for decorative Pelargonium *Defiance*; and to Mr. W. Brown, Brent Nurseries, Hendon, for decorative Pelargonium *Attraction*, rosy-scarlet with maroon blotch and violet centre.

FRUIT COMMITTEE.—Henry Webb, Esq., in the chair. The most striking object brought under the notice of this body was a magnificent female cone of *Encephalartos Altensteinii*, which measured 18 inches in length, and 27½ inches in circumference. It was exhibited by Mr. Bergman, gr. to Baron Rothschild, at Ferrières, who received a vote of thanks. Mr. John Simms, gr. to W. B. Eastwood, Esq., Kingswood, Englefield Green, showed a dish of President Strawberry of remarkably fine size, the finest dish that we have seen this season. A large dish of Dr. Hogg Strawberry was also sent by Mr. Miller, gr., Clumber. Mr. S. A. Woods, gr. to F. J. S. Foljame, Esq., Osberton Hall, Worksop, sent a couple of fine fruits of seedling Melon, named "Luscious and Melting," a large, almost round, white-fleshed variety, of good flavour, but really too tender in the flesh—a most unusual fault to find in a Melon. Mr. R. Gilbert, of Burghley, showed a seedling Melon named *Excelsior*, a scarlet-fleshed variety of good quality, but not superior in this respect to others in cultivation. Mr. J. McIndoe, gr., Hutton Hall, Guisborough, sent a nice looking white-fleshed Melon named *Marcellus*, a most peculiarly flavoured fruit, which we can only compare with a Snowball Turnip mixed with a little sugar. From Mr. W. Child, gr. to the Earl of Coventry, Croome Court, Severn Stoke, came a brace of Cucumbers about 15 inches long, and white-spined but almost smooth; and Mr. S. Ledsham, Green Lane, Tarvin Road, Chester, again sent a fine sample of his Late White Broccoli, which was reserved for comparison with Cattell's Eclipse, which it was generally considered to resemble, and of which it is probably a well selected stock. In any case, considering the winter that the plants have passed through and their fine quality as shown, it is a variety of great merit.

Reading Horticultural: May 20.—The spring show within the Abbey ruins had several striking points of attraction, but it was generally thin. Reading needs a new generation of enterprising exhibitors. The prizes are on the whole pretty good, and of a character to tempt local exhibitors, as well as to bring some from a distance. The well laid-out turf banks form a large space to fill, which cannot be contracted as in the case of tents. But Reading has in its environs so many charming places where there is no stint of good accommodation, that we would fain hope new exhibitors will be forthcoming, and the townspeople appear willing to support the two annual shows if they can only be maintained in a character worthy of such support.

Stove and greenhouse plants in nines, sixes, and threes in the classes for specimens, are always the leading feature at the May show. Mr. Marsland, The Wilderness, White Knights (Mr. W. Lees, gr.), was 1st with a well-proportioned lot, consisting of *Pimelea decusata*, *Clerodendron Balfourianum*, *Francisca calycina major*, very fine; *Stephanotis floribunda*, *Anthurium Scherzerianum*, *Euphorbia splendens*, very well bloomed; *Azalea Charmer*, *Erica ventricosa grandiflora*, *Epacris miniata splendens*, and *Azalea Due de Nassau*. Mr. J. F. Mould, nurseryman, Pewsey, was 2d with a few remarkably good plants, in company with some that reduced the value of the collection as a whole. There was a splendid piece of *Clerodendron Balfourianum*, *Aphelexis macrantha purpurea*, *Erica Cavendishiana*, *Dipladenia Brearleyana* and *D. regina*, a charming pale-coloured variety; *Lantana Don Calmet*, a very pretty form, the flowers opening orange, and becoming orange-magenta and crimson, &c. The only exhibitor of six plants was Mr. Lonergan, Esq., Crestingham, Reading (Mr. E. Bennett, gr.), a new exhibitor

that promises to take a good position at these exhibitions. In the class for the best flowering specimen of stove and greenhouse plants there was a spirited competition, Messrs. Lees and Mould being placed equal 1st, the former with a finely grown and flowered plant of *Tabernaemontana coronaria fl. pleno*, that was one of the features of the show; and the latter with a perfect specimen of *Aphelexis macrantha rosea*. Other good specimens were *Bougainvillea glabra*, *Anthurium Scherzerianum*, &c. Major Storer, Purley Park (Mr. S. Mortimer, gr.), was 2d; and extra prizes were awarded to the Hon. R. F. Boyle, Purley (Mr. T. Hope, gr.), and Mr. E. Bennett.

Orchids in threes were remarkably well shown, the 1st prize going to G. May, jun., Esq., Reading (Mr. J. Pound, gr.), who had a fine and well-flowered example of *Aerides Fieldingii*, *Cattleya Warneri*, with two fine blooms; and *Dendrobium suavisimum*, very bright and effective. 2d, Colonel Loyd-Lindsay, M.P., Locking Park, Wantage (Mr. J. Atkins, gr.), with *Dendrobium nobile*, *Oncidium sphaecelatum*, and *Cattleya Mossiae*. An extra prize was awarded to W. J. Palmer, Esq. (Mr. W. Baskett, gr.). The latter had the best specimen Orchid in a good example of the beautiful *Dendrobium Devonianum*. Mr. Pound was 2d with the chaste *D. Bensoniae*.

Pelargoniums were as usual very good, but the competition was unfortunately limited. The best nine Show varieties came from W. Fanning, Esq., Whitechurch (Mr. J. Ashby, gr.), who had good plants of *Countess*, *Duchess of Edinburgh*, *Triomphe de St. Mandé*, *Empress*, *Ernest*, *Mons. Duvall*, *Mabel*, *Ruth*, *Lilacina* and *Alchymist*. The best six Fancy varieties came from Colonel Clayton, Maidenhead (Mr. W. Burgess, gr.)—small but nicely grown and flowered plants. In the classes for four Show and four Fancy Pelargoniums there was a good competition, Messrs. Ashby and Mortimer being 1st and 2d in the former class, and Messrs. Burgess and Baskett in the latter.

Roses in pots were very well shown, and they were much and deservedly admired by the visitors. In the class for six varieties Mr. Lees was 1st with *Jules Margottin*, *Charles Lefebvre*, with large and well-formed highly coloured flowers; *La France*, *Charles Lawson*, *Maréchal Niel*, and *John Hopper*. 2d, Mr. J. F. Mould; 3d, Mr. Baskett. In the class for four Roses in pots Lord Otho Fitzgerald, Windsor (Mr. T. Lockie, gr.), was 1st; and Mr. J. Tranter, Henley, 2d. *Calceolarias* were numerous and finely shown in the form of nice medium-sized specimens well balanced in flowers and foliage, the flowers large and finely marked. The best six came from Miss Patterson, Ascot (Mr. J. Tomlin, gr.), Messrs. Baskett and Burgess coming in 2d and 3d, and an extra prize was awarded to Mr. G. W. Palmer, Reading (Mr. W. Baskett, jun., gr.). One group of six *Fuchsias* was shown, from Mr. Lees, and remarkably good plants they were for the season of the year; and *Lye's Elegance*, a finely formed and very handsome dark variety, deserves especial mention as an exhibition sort.

The only exhibitor of nine *Azaleas* was Mr. E. Bennett; they were a little past their best, but showed ample indications of good cultivation: they were generally of large size. In the class for six varieties *Nalder Clarke*, Esq., Reading (Mr. W. Armitage, gr.), was 1st with small but remarkably well flowered plants; Mr. F. Lockie coming 2d. *Ericas* were also well shown, Messrs. Lees and Bennett competing cleverly with six varieties, the former having rather the best of it; the plants were highly creditable, and a few exceptionally good.

Foliage plants, as represented by the ordinary subjects, *Ferns*, *Lycopods*, &c., were as usual numerous. In the class for a specimen plant, shown for foliage, Mr. Mortimer was 1st with a magnificently developed specimen of *Encephalartos villosus*; E. Eyre, Esq., Newbury (Mr. Ross, gr.), being 2d with a very fine example of *Platyceerium alciorne*. In the classes for collections some good specimens were also shown.

Cut flowers comprised excellent *Roses*, stove and greenhouse plants, Mr. Bennett coming in 1st with a very fine lot of twelve varieties, Mr. Atkins being 2d. Vases for table decoration and bridal bouquets: in both of these Miss Phippin was placed 1st with admirable arrangements. Buttonholes and vases of wild flowers: these were numerous and very good, and attracted a large share of attention.

In the division for fruit there were some excellent exhibits. The Black Hamburg Grapes were magnificent, Mr. Ashby, who was 1st, showing some excellent bunches; Mr. Atkins being 2d; while the same positions were held in the class for white Grapes, Buckland Sweetwater being shown. Mr. Ashby had some first-rate Early Ascot Peaches. Strawberries were very good. In the vegetable classes there was a very keen competition. Cucumbers were well shown, especially in the class where special prizes were given by Messrs. Sutton & Sons. Carter's Model and Sutton's Duke of Connaught were the best varieties, but there is little to choose between the former and Telegraph.

# The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON,  
FOR THE WEEK ENDING WEDNESDAY, MAY 26, 1880.

May 20.—A fine day, but cloudy. Warm. Clear towards night.  
 — 21.—A fine bright day. Very warm. Breeze. Cloudy at night.  
 — 22.—Fine, though dull and cloudy till evening, then cloudless. Strong wind.  
 — 23.—A fine day, though rather dull and cloudy. Strong wind. Cooler.  
 — 24.—Generally fine and bright, though frequently dull and cloudy. Strong wind.  
 — 25.—A very fine, bright, warm day. Smart breeze. Clear at night.  
 — 26.—A very fine hot day. Cloudy after 5 P.M., few drops of rain at 7 P.M. Frequent lightning at night.

LONDON: *Barometer.*—During the week ending Saturday, May 22, in the vicinity of London the reading of the barometer at the level of the sea increased from 30.15 inches at the beginning of the week to 30.29 inches by the evening of the 18th, decreased to 30.11 inches by the evening of the 19th, increased to 30.29 inches by the evening of the 20th, decreased to 29.80 inches by the afternoon of the 22d, and was 29.86 inches at the end of the week. The mean reading for the week at sea level was 30.15 inches, being 0.05 inch above that of the preceding week, and 0.23 inch above the average.

*Temperature.*—The highest temperatures of the air observed by day varied from 76° on the 21st to 58½° on the 19th; the mean value for the week was 65½°. The lowest temperatures of the air observed by night varied from 34° on the 19th and 37° on the 18th to 49½° on the 22d; the mean for the week was 43°. The mean daily range of temperature in the week was 22½°, the least range in the day being 12½°, on the 22d, and the greatest, 29¼°, on the 21st.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—16th, 54°, +1°7'; 17th, 50°, -2°8'; 18th, 48°, -5°2'; 19th, 45°7', -7°9'; 20th, 57°5', +3°8'; 21st, 59°5', +5°6'; 22d, 55°6', +1°5'. The mean temperature of the air for the week was 52°9, being 0.5° below the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 155° on the 16th, 152° on the 17th, and above 140° on the 18th, 20th, and 21st; on the 19th and 22d the reading did not rise above 95°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 24° on the 19th, 26° on the 18th, 28½° on the 17th; the mean of the seven lowest readings was 33½°.

*Wind.*—The direction of the wind was N.E., N.W., and W.S.W., and its strength strong. The weather during the week was fine and bright, and very dry. The first four days of the week were cool, but the remainder were warm. No rain fell.

ENGLAND: *Temperature.*—During the week ending Saturday, May 22, the highest temperatures of the air observed by day were above 75° at Truro, Plymouth, Blackheath (London), and Cambridge, and below 67½° at Brighton, Wolverhampton, Sheffield, and Bradford; the mean value from all stations was 70¾°. The lowest temperatures of the air observed by night were below 36½° at Bristol, Blackheath, Cambridge, and Wolverhampton, and above 40° at Plymouth, Sheffield, and Sunderland; the mean value from all places was 37½°. The extreme range of temperature in the week was above 42° at Blackheath and Cambridge, and below 28° at Sheffield and Bradford; the mean range of temperature from all stations was 33½°.

The mean of the seven high day temperatures was above 66° at Truro, Plymouth and Cambridge, and below 61° at Norwich, Sheffield, and Hull; the mean value from all places was 63¾°. The mean of the seven low night temperatures was below 43° at Blackheath, Cambridge, Wolverhampton, Nottingham, and Hull, and above 47° at Truro and Plymouth; the general mean from all stations was 44½°. The mean daily range of temperature in the week was above 22° at Blackheath, Cambridge, and Nottingham, and below 16¼° at Norwich and Leeds; the mean daily range from all places was 19¼°.

The mean temperature of the air for the week from all stations was 52½°, being 1½° higher than the value for the corresponding week in 1879. The mean temperature was above 55½° at Truro and Plymouth, and below 51° at Norwich, Wolverhampton, Sheffield, and Hull.

*Rain.*—Very little rain fell. The largest amount was at Norwich, 0.18 inch, and the least at Cambridge and Bradford, both 0.01 inch; the average fall over the country was 0.03 inch. In the south and west of England no rain fell.

The weather during the week was generally fine, bright, and dry.

SCOTLAND: *Temperature.*—During the week ending Saturday, May 22, the highest temperatures of the air observed by day varied from 75° at Dundee to 66° at Greenock; the mean value from all places was 70¾°. The lowest temperatures of the air observed by night varied from 35° at Perth to 40½° at Glasgow; the general mean from all places was 38°. The mean range of temperature in the week from all stations was 32½°.

The mean temperature of the air for the week from all stations was 53½°, being 4½° above that of the corresponding week in 1879. The mean temperature was above 55° at Glasgow, and below 52° at Aberdeen.

*Rain.*—The amounts of rain measured were small. At Edinburgh, Greenock, and Leith, two-tenths of an inch fell, whilst at Glasgow only one-hundredth of an inch was measured. At Perth no rain fell. The average fall over the country was 0.11 inch.

DUBLIN.—The highest temperature of the air was 72½°, the lowest was 35½°, the extreme range 37¼°, the mean 54°. No rain fell.

JAMES GLAISHER, F.R.S.

## Variorum.

MANURES.—The amount of manure employed per acre of land differs much according to the material used, and the land on which it is to be put. In the Lothians, farmyard manure, when used alone, is employed to the extent of 20 tons per acre, and from that up to 25 or even 30 tons per acre; dissolved bones, 6 to 8 cwt. per acre; dissolved bone ash, 7 to 9 cwt. per acre; and mineral superphosphate, from 8 to 10 cwt. per acre. The phosphatic and nitrogenous, or incomplete manures, may be advantageously employed together; the phosphatic being ploughed in and the nitrogenous applied in spring as a top-dressing. Mineral superphosphate or dissolved bone ash (5 cwt.) and nitrate of soda (2 cwt.), will be found a useful mixture; and where farmyard and dissolved bones are to be used together, 15 to 20 tons of the former, with 5 cwt. of the latter, will prove efficient. Fish guano may be used along with farmyard manure, in which case 5 cwt. of fish, with 15 tons of farmyard manure, forms a good mixture; or the fish guano, to the extent of 6 or 7 cwt., with 7 or 8 cwt. of dissolved bones, will be found to yield good results. For top-dressing, sulphate of ammonia is employed to from 112 lb. (1 cwt.) to 200 lb. per acre, or nitrate of soda from 154 lb. to 275 lb. per acre, that is in the proportion of 550 of nitrate of soda to 400 of sulphate of ammonia. With sulphate of potash 2 cwt. will form a good proportion. *W. Ivison Macadam, F.C.S.*

HORTICULTURE IN NEBRASKA.—Nebraska carried off the prize from all other States for her fruit several years ago, and she deserves it. The State has always taken an active interest in fruit culture, and it now keeps it up, as we see by the programme of a meeting of the State Horticultural Society held at Lincoln in January last. Liberal premiums were offered for winter Apples and Pears, and also for flowers, and a number of interesting addresses were given. The State is divided into six fruit districts, and reports were made from each. The prominence of Nebraska as a fruit-growing State is largely due to the efforts of this Society, and the success of the Society is largely due to the active interest of its president, Governor R. W. Furnas. *American Agriculturist.*

EUCALYPTUS DIVERSICOLOR.—One of the grandest trees of the globe, and one of the greatest wonders in the whole creation of plants. Astounding records of the height of the giant tree have been given. Messrs. Muir saw trees with stems about 300 feet high up to

the first branch, and I myself noticed many trees which approached to 400 feet in their total height. When closely growing the young trees may have a comparatively slender trunk, so much so that a tree 180 feet high may show a stem hardly above a foot in diameter, in such a case the foliage, for want of space, is also only scantily developed, and the ramifications are but short in proportion to the tallness of the stems. In the mast-like straightness of the trunk and the smooth whiteness of its bark, this superb tree imitates completely the variety regnans of *E. amygdalina* of South-east Australia, with which also, and perhaps solely, it enters into rivalry as the tallest tree of the globe! Even the loftiest trees may not yet have been found out in the secluded humid forest valleys, in which *E. diversicolor* like *E. amygdalina* rejoices most and luxuriates to the greatest extent. But possibly in the 200 miles of uninterrupted length of Sequoia forests, a few years ago rendered known to exist in Southern California, mammoth trees of either Sequoia Wellingtonia or *S. sempervirens* may occur, which possibly excel in stupendous height even the famous individual trees of the Calaveras grove. "*Eucalyptographia.*" By Baron Ferd. von Mueller, K.C.M.G., &c., Government Botanist for the Colony of Victoria.

THE GRUB OF THE COCKCHAFER IN GERMANY.—In the *Monatsschrift*, &c., for March of the current year is a short article on this subject, from which it would seem that the grub of the cockchafer or Maybug is sometimes as destructive in Germany as in France. It breeds in enormous quantities in certain places, and if its existence is not early discovered it clears everything before it. The author of the article in question, M. Konnenkamp, superintendent of the city gardens of Berlin, relates that he has experienced four recurrences of this plague. In one case the rich and valuable stock of a nursery was annihilated, and the owner parted from his land an impoverished man. Last summer these grubs appeared in astonishing numbers in the public garden called the Humboldtshain. It is computed that no less than 40,000,000 of them were collected from a piece of turf less than 15 acres in extent. The only effectual method of dealing with them was to collect and destroy. Various other means were tried, with very little success. Even moles will not eat them if they can get worms. Fluid applications only drove them to a greater depth, to return again, and many things that will kill the grubs leave the ground in an unfit state for vegetation. They ate away the roots of the turf, that the latter could be rolled up as if it had been cut in the ordinary way.

## Enquiries.

*He that questioneth much shall learn much.*—BACON.  
 RHUBARB.—Could any one give us an idea what quantity of Rhubarb could be gathered from an acre of good ground in one season? *Canon & Reid.*

## Answers to Correspondents.

BOTANY: *L. E.* It would be best to get the lad a situation at Kew, or some other botanic garden.  
 BOUQUETS AT MANCHESTER.—Mr. John Jones, The Nurseries, Coton Hill, Shrewsbury, requests us to state that he was awarded an extra prize at the late Manchester Show for bridal and ball bouquets.  
 BRAZILIAN GARDENING JOURNAL: *Barnes.* The only one we know of is the *Revista de Horticultra*, published at Rio Janeiro by Signor A. Albuquerque; but we do not know if it is still continued. It is a long time since we saw a number.  
 DISMISSAL: *Uncertain.* You have no legal claim against your employer for expenses.  
 GALVANISED WIRE FOR PEACH WALLS: *L. F.* The question has not been cleared up, so far as we know, and as the wire appears to be sometimes certainly injurious, we should in the meantime recommend the old plan of training by means of nails and shreds. Ordinary wire would soon perish from corrosion, so that it is not advisable to employ that under any circumstance. If you must use galvanised wire, we would certainly recommend you to paint it.  
 GLOXINIA: *E. J. P.* Very poor by comparison with hosts that have been exhibited. It would not pass muster at all at South Kensington.  
 MARKET PRICES: *R. C. H.* Our information is given us by the dealers, and represents the average retail price of the week. It does not, and could not, show the price the dealer would give to the producer. We have had very numerous complaints, year after year, but as we are not dealers ourselves we cannot rectify the matter, and if we were we should probably do as the dealers do.  
 NAMES OF PLANTS: *C. E. F.* *Claytonia perfoliata*, native of North America, but naturalised in this country.—1. *Mimic*. 1. *Asperula odorata*; 2. *Prunus Padus* (the Bird Cherry).—3. *Centaurea montana*; 5. *Hesperis matronalis*; 6. *Aubrietia deltoidea*; 7. *Lastrea Filix-mas*.—*C. 12 bunches	4 0-9 0	bundle	4 0-8 0

### SEEDS.

LONDON May 26.—The market to-day was very thinly attended, and the business doing as nearly nil as possible. The prolonged drought naturally stops all consumptive demand, and no speculative movement of importance has yet developed itself. Many descriptions of seeds, owing to the bad prospects of the growing crops, are held for more money. This is notably the case with Trefoil, red Clover seed, Intolium, and winter Tares. The American and Canadian Clover crops, in particular, are also reported as most unpromising. Sowing Mustard and Rape seed keep firm. The trade for blue Peas gets better every week. Buckwheat is dearer. Linseed steady. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

### CORN.

There was nothing much doing at Mark Lane on Monday, and as regards Wheat the tone was not very good. There was no pressure to sell, and in the absence of business rates were much the same as on Monday se'night. Barley was quiet and without change in value. Malt moved off slowly on former terms. Oats were firm, and rates were 6d. to 1s. per quarter higher on the week. Maize advanced fully 6d. per quarter. Beans and Peas were quite as dear. Flour was dull and not very well supported.—On Wednesday there was a very limited attendance at market, and the small amount of business done was at about previous rates for sound descriptions. Foreign Wheat was in limited request at Monday's prices. Oats, Beans, and Peas remained firm; but the Barley trade ruled quiet.—Average prices of corn for the week ending May 22:—Wheat, 44s. 6d.; Barley, 32s. 8d.; Oats, 25s. 5d. For the corresponding period last year:—Wheat, 41s. 4d.; Barley, 28s. 10d.; Oats, 22s. 6d.

### CATTLE.

At the Metropolitan Market on Monday trade in beasts was not brisk, but choice qualities were readily disposed of at rather over the previous Monday's quotations. The number of sheep on sale—considerably larger than was expected—was for the most part disposed of at fully late rates. Trade was slow for lambs, but choice qualities maintained their price. Quotations:—Beasts, 4s. 4d. to 5s., and 5s. 6d. to 6s. 2d.; calves, 5s. 4d. to 6s. 6d.; sheep, 5s. 2d. to 5s. 6d., and 6s. 4d. to 7s.; lambs, 7s. 8d. to 8s. 4d.; pigs, 4s. 6d. to 5s. 6d.—Trade on Thursday was quiet but steady, and the supply of beasts short. With a firm trade the tendency was against the buyer. Sheep and lambs were quiet but firm, calves sold at full prices.

### HAY.

At the Whitechapel Market on Tuesday there was a large supply and trade was dull. Prices were as follows:—Prime Clover, 100s. to 132s.; inferior, 60s. to 95s.; prime meadow hay, 80s. to 102s. 6d.; inferior, 30s. to 70s.; and straw, 30s. to 37s. per load.—On Thursday there was a moderate supply of hay and straw on offer. The trade was good for best hay and straw, prices for which were dearer. Quotations:—Prime Clover, 100s. to 132s.; inferior, 60s. to 95s.; prime meadow hay, 80s. to 102s.; inferior, 30s. to 70s.; and straw, 30s. to 37s. per load.—Cumberland Market quotations:—Superior meadow hay, 100s. to 110s.; inferior, 48s. to 78s.; superior Clover, 126s. to 132s.; inferior, 84s. to 108s.; and straw, 34s. to 40s. per load.

### POTATOS.

The Borough and Spitalfields Markets reports state that supplies have been on a moderate scale. The trade has been quiet, and prices are as follows:—Scottish Champions, 150s. to 160s.; Lincoln ditto, 140s. to 150s.; Victorias, 150s.; German reds, 4s. to 7s. per bag; and French whites, 4s. 3d.—The imports into London last week consisted of 17,393 bags from Hamburg, 476 packages from Lisbon, 3088 packages 4722 bags Malta, 11,949 bags Danzig, and 3998 packages from Huelva.

### COALS.

The prices current at market during the week were as follows:—Walls End—Hetton, 14s. 6d.; Hetton Lyons, 13s.; Hawthorns, 13s. 3d.; Original Hartlepool, 14s. 6d.; South Hetton, 14s. 6d.; Tunstall, 13s.

**Government Stock.**—On Monday Consols closed at 99½ to 99¼ for delivery, and 99½ to 99¼ for the account. Tuesday's closing prices were 99½ to 99¼ for delivery, and 99½ to 99¼ for the account. The final prices of Wednesday were 99½ to 99¼ for delivery, and 99½ to 99¼ for the account; Thursday's figures were 99½ to 99¼ for both account and delivery.

## Lawn Mowers — Lawn Mowers.

### THE GREAT SUPERIORITY OF GREEN'S PATENT "SILENS MESSOR" AND "MONARCH" LAWN MOWERS

Over those of all other Makers is universally acknowledged. They will Cut Either Short or Long Grass, Bents, &c., Wet or Dry. These advantages no other Lawn Mowers possess. They have been in constant use for upwards of twenty years in

- The Royal Gardens, Windsor,  
 Buckingham Palace Gardens, The Hyde Park Gardens  
 Marlborough House Gardens, Hampton Court Gardens  
 Royal Horticultural Society's, The Zoological Gardens,  
 Gardens, South Kensington, Regent's Park  
 The Royal Botanic Gardens, The Dublin Botanic Gardens  
 Regent's Park, The Liverpool Botanic Gardens  
 The Crystal Palace Company's, The Botanic Gardens, Brussels  
 Gardens, Sydenham, The Hull Botanic Gardens  
 The Winter Palace Gardens, The Leeds Horticultural  
 Dublin, Gardens

And in most of the Principal Parks and Squares in the United Kingdom.

They are the simplest in construction, the easiest to work, the least liable to get out of order, make little noise when in use, and are the most durable Lawn Mowers extant. The above machines have proved to be the best, and have carried off Every Prize in all cases of Competition. Every Lawn Mower is guaranteed to give entire satisfaction, otherwise it may be returned at once, free of cost to the purchaser. The largest stock of Mowers kept in London, and including all sizes from 6 inches to 48 inches, is to be seen at our London establishment, 54 and 55, Blackfriars Road, where purchasers can select out of several hundred Machines, and have their orders executed the same day they are received.

Prices of Horse, Pony, and Donkey Machines, on application. They can be had of all respectable Ironmongers and Seedsmen in the United Kingdom, or direct from the manufacturers. Carriage paid to all the Principal Railway Stations in the United Kingdom. Illustrated Price LISTS free on application. N.B.—Those who have Lawn Mowers to Repair will do well to send them either to our Leeds or London Establishments, where they will have prompt attention, as an efficient staff of workmen is kept at both places.

## GREEN'S PATENT ROLLERS

For Lawns, Drives, Bowling Greens, Cricket Fields and Gravel Paths. SUITABLE FOR HAND OR HORSE POWER.

These Rollers are made in two parts, and are free in revolving on the axis, which affords greater facility for turning. The outer edges are rounded off, or turned inwards, so that the unsightly marks left by other Rollers are avoided.

They can be had of all respectable Ironmongers and Seedsmen in the United Kingdom, or direct from the Manufacturers, THOMAS GREEN AND SON (Limited), SMITHFIELD IRONWORKS, LEEDS. And 54 and 55, BLACKFRIARS ROAD, LONDON, S.E. Carriage of Rollers Paid to all the Principal Railway Stations in Great Britain.

# THE BEST STRAIN OF CALCEOLARIA.

**SUTTON'S  
PERFECTION.**

*From Mr. E. NICTNER, Head Gardener to H.I.M. the German Emperor, Sans Souci Palace, Potsdam.*—"The Calceolaria seed which you supplied to me produced marvellous flowers, which were the admiration of all that have been staying at the palace."

*From the "Gardeners' Magazine," June 29, 1879.*—"At the seed grounds of Messrs. Sutton & Sons, Reading, we recently saw a collection of Calceolarias possessing all the fine qualities for which this firm are famous. The plants were of a very dwarf and compact character; the foliage was stout and bold, close jointed, very robust, and clean. The heads of bloom were enormous; the flowers were large, handsomely coloured, and of capital quality. Some of the mottled flowers, and especially those mottled and barred with dark, were very fine; and we noticed some that appeared to be of a quite distinct character. It is the aim of Messrs. Sutton & Sons to have their collection characterised by as much variety as possible, and when anything specially good presents itself the flowers are carefully fertilised, so as to secure the strain."

**SUTTON'S  
PERFECTION.**

*From the "Gardeners' Chronicle."*—"A remarkable collection of Calceolarias is now in bloom at Messrs. Sutton & Sons' Nursery, Reading. Each plant is densely laden with large flowers, and the colours are very varied, from creamy white, handsomely spotted on the body, to rich dark maroon."

*From the "Garden."*—"The Calceolarias at Messrs. Sutton & Sons' Nurseries, Reading, are just now beautifully in bloom. The strain is one of the finest, being the result of years of careful selection. Many of the individual flowers measure 2½ inches across, and are perfect in shape and colour."

*From Mr. E. BARRHAM, Gardener to Right Hon. the Earl of Selton.*—"It affords me great pleasure to be able to inform you that your Calceolaria seed has given extreme satisfaction. I have just now in flower one of the finest collections of hybrid Calceolarias it has ever been my lot to look upon. They are excellent in variety, form, and size of flower. Many have seen them, and are highly gratified."

WHITE HELLEBORE POWDER.—The only destroyer of the destructive maggot on Gooseberry Trees, &c. To be had Wholesale of

GEO. GAINES, Covent Garden, W.C.

GISHURST COMPOUND.—Used by many of the leading Gardeners since 1859, against Red Spider, Mildew, Thrips, Greenfly, and other Blight, in solutions of from 1 to 2 ounces to the gallon of soft water, and of from 4 to 16 ounces as a winter dressing for Vines and Fruit Trees. Has outlived many preparations intended to supersede it. Sold Retail by Seedsmen in Boxes, 1s., 3s., and 10s. 6d. Wholesale by PRICE'S PATENT CANDLE COMPANY (Limited).

Weeds Eradicated from Lawns.

WATSON'S LAWN SAND best destroys

Daisies, Plantains, Rib-grass, &c., and invigorates the grass. Testimonials and instructions on application. 35s. per cwt.; 50 lb. kegs, 19s.; 28 lb. tins, 10s.

Proprietor, W. D. BARBOUR, 3, Park Row, Leeds.

Tobacco Fibre Insecticide.

All who have a Greenhouse and love to see their Plants look clean and healthy should use

DARLINGTON BROTHERS' TOBACCO FIBRE.—Contains more Nicotine than any other Insecticide sold; purer and better than the best Tobacco Paper or Cloth; easy to use; no apparatus requisite; a common garden pot only required; will not flare, is perfectly safe, and is the best article for making Nicotine Juice for syringing purposes. Forty per Cent. saved by the use of this article. Prices, 6 lb., 5s.; 25 lb., 21s. First-class ROLL TOBACCO PAPER or CLOTH, same price as above. Best Paper and Cloth made. Trade Testimonials, free on application. Post-office Orders, Darlington Brothers, Chatham. Cheques crossed London and Provincial Bank. DARLINGTON BROTHERS, Frederick Street, Chatham.

WEEDS, AND HOW TO DESTROY THEM.—Gentlemen can have the Weeds, Moss, &c., Destroyed on their Garden Walks, Carriage Drives, &c., without disturbing the gravel, by watering them with a solution of SMITH'S WEED KILLER, a liquid preparation destructive to all vegetable growth. It merely requires mixing with cold water, and is applied with an ordinary watering-can. Four gallons of the concentrated solution make 100 gallons of Weed Killer. Price 7s. 6d., carriage paid to any railway station.

References and particulars on application to the Manufacturer and Proprietor, MARK SMITH, Operative Chemist, 8, Mercer Row, Louth, Lincolnshire.

Rosher's Garden Edging Tiles.

**"THE COVENTRY" LAWN MOWER**

(REGISTERED). MANUFACTURED BY

**NETTLEFOLD & SONS,**

54, HIGH HOLBORN, LONDON, W.C.

PRICES:

- 8-inch .. £2 2 0
- 10-inch .. 3 3 0
- 13-inch .. 4 4 0
- 15-inch .. 5 5 0
- 18-inch .. 6 6 0

The attention of the Public is invited to "THE COVENTRY" LAWN MOWER, which can be confidently recommended as the best and cheapest in the market; for lightness and ease in working it cannot be surpassed.

It has all the improvements which have of late been introduced into this class of Machine, either in England or America.

It will cut wet or dry grass of any length, will turn in its own width, and is so light that a lady can use a 15-inch Machine of this make with greater ease than a 10-inch of the ordinary kind.

It is cheaper than any other Machine of its class before the public.

It is made, as its name implies, at Coventry, by skilled English workmen, and of best English Steel and Iron.

These Machines can also be supplied with rollers at same price, and with Grass Boxes at a small extra cost.

**NEW PATENT GRASS-CUTTERS**

(PATRONISED BY THE BOARD OF WORKS).

W. CLARK, 232, Oxford Street, London, W.

Begs to call public attention to a Patent Grass-Cutter he has just invented for use in the Garden and Farm, based upon the principle of the well-known "Clark's" Horse-clipping Machine, and which is, by its lightness of construction and rapidity of action, far preferable to the existing implements in use, and supplies a want long felt by every one who possesses a garden, namely, an instrument which will mow grass where inaccessible to the lawn mower, trim grass plot edges, clip Ivy and other creepers, also shrubs and trees, and keep in order Box borders and fancy Trees, &c.; all which this ingenious little instrument is capable of doing.

It is made in three sizes, to cut in breadth 8 inches, 12 inches, and 16 inches respectively; and is so easy in working, and at the same time so effective, that even ladies can work it without feeling fatigued, there being no occasion to stoop on account of the long wooden handles attached to the machine, and a greater quantity of work can be done in a given time than by any other method.

This invention is also applicable for Farm purposes—Reaping Corn and other Crops, Clover, Rye, &c., equally as well as accomplishing the objects for which it is required in the garden; and the cost being so small in proportion to the saving in time and quality of finish effected, it is placed within the reach of all, and needs but a trial to prove its superiority.

PRICES.

- The 8-inch Machine, complete with Rollers and Tray .. .. 21s.
- Ditto, without Rollers and Tray .. .. 18s.
- The 12-inch Machine, complete with Rollers and Tray .. .. 28s.
- Ditto, without Rollers and Tray .. .. 24s.
- The 16-inch Machine, complete with Rollers and Tray .. .. 38s.
- Ditto, without Rollers and Tray .. .. 33s.

To be obtained of all Ironmongers, Horticultural and Agricultural Implement Manufacturers throughout the Kingdom, and of the Patentee.

W. CLARK, 232, OXFORD STREET, LONDON, W.

**THE TERMINAL SADDLE BOILER.**—  
First-class Certificate, 1877; Highly Commended, 1873; and First-class Certificate, 1875.

"This boiler possesses the rare merit of sucking all the heat from the fire."—*Gardener's Magazine*, p. 254.  
"I have no doubt the Best Boiler, that will burn any kind of fuel, is the Terminal Saddle."—*Journal of Horticulture*, p. 327.  
"For moderate cost and real efficiency the Terminal Saddle is one of the very best."—*The Gardener*, p. 95.  
Prospectus post-free.  
T. JONES, Temple Street, Manchester.

**JONES'S PATENT "DOUBLE L" SADDLE BOILER.**

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increase the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 in.	18 in.	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1000	16 0 0
24 "	24 "	48 "	1400	20 0 0
28 "	28 "	60 "	1800	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, *Nurseries, Ballham Hill, S.W.*,  
May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES AND SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E.  
When ordering Boilers please refer to the above advertisement.

**IMPROVED GREENHOUSE GAS BOILER.**—From numerous experiments, a Copper Laminated Gas Hot-water Generator has been produced and thoroughly tested. It obviates a faulting that usually occurs in Boilers heated by gas, viz., the passing away of the heat through the flue with only imparting a small portion to the water. Price, with Pipes, &c., complete for standing in place, £5 10s.

G. P. MARSHALL, Engineer, &c. Temporary Office—St. Mark's Buildings, Leonard Square, Finsbury, London, E.C. Works—32, Trevillee Street, Plymouth.

**X PIPES.—PIPES.—PIPES. X**

**"EUREKA" FUMIGATORS**  
are the best and cheapest for all purposes. May be had from all Seedsmen, &c., 2s., 2s. 6d., 4s., 5s., 6s., 6d. each, package extra. TOBACCO CLOTH, 10d. per pound. SEED DRILLS, CAP GLASSES, SYRINGES, &c. LISTS free. SYERS, Bowdon, Cheshire.

By Royal Letters Patent.  
**RITCHIE'S GAS LIGHTING**  
and HEATING APPARATUS.

No Flue required. Specially adapted for Drying Newly-built Houses. Silver Medal awarded in 1878 at Wolverhampton Exhibition. The deleterious and unpleasant vapours arising from the burning of ordinary coal gas are prevented from escaping, and are made to circulate within the Apparatus or Stove in such a way that they become thoroughly condensed, and are carried off in the form of a liquid, in which will be found the sulphur and other poisons which are drawn from and would in the ordinary way be left in and mixed with the surrounding atmosphere; consequently health is not prejudicially affected, Works of Art, Plants, Pictures, Books, Furniture, &c., are not injured, and the atmosphere is rendered uncontaminated and perfectly healthy.

Prices from 50s. to £10 10s.  
Full particulars and testimonials forwarded on application to RITCHIE and CO., 23, St. Swithin's Lane, London, E.C.

Oil Paint No Longer Necessary.  
**HILL and SMITH'S BLACK VARNISH**  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.  
Sold in casks of about 30 gallons each, at 1s. 6d. per gallon at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.  
"Pierrefield Park, June 21, 1876.—Sirs,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, WM. COX."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H & S's Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE of Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to  
**HILL and SMITH, Brierley Hill Ironworks, Staffordshire;**  
118, Queen Victoria Street, London, E.C.; and 180, Buchanan Street, Glasgow.

Two Gold Medals awarded to us by the Royal Horticultural Society, at the

Grand Show at Freston, July, 1878. out of Fifteen Competitors.

Having extensive works, special machinery, and first-class workmen, who have been many years in the trade, we are able to supply the very best class of buildings at an extremely low price. As we are the only firm in the kingdom that has ever been awarded Two Gold Medals by the Royal Horticultural Society, this will be some proof of the quality of our productions.

Our buildings are constructed so as to combine great strength, simplicity, and durability, with extreme lightness, and being made of the very best materials, will, with ordinary care, last a lifetime. The ventilators at top and bottom open the whole length with one handle to each series. The glass used is 21-oz. British sheet, and the paint the best genuine white lead and oil.

HEATING APPARATUS, with thoroughly reliable Boilers supplied and fixed in the most practical and efficient manner, and guaranteed to work economically and answer its purpose in all seasons. We devote special personal attention to this branch of our business, and have never had a failure.

**CLERK (JUNIOR), or ASSISTANT in a Nursery or Seed Business.**—Age 21; slight experience, but willing to take small commencing salary. Excellent references.—**W., 10, Westbourne Street, Piccadilly, London, S.W.**

"By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—*Civil Service Gazette.*

**GRATEFUL AND COMFORTING.**

**JAMES EPPS AND CO., HOMOEOPATHIC CHEMISTS.**

**WHAT PRODUCES HAIR?**

"We are glad to be able to announce that an answer has been found to this long puzzling and perplexing of questions in Warde's Capillare, which, however, turns out not to be a 'new discovery,' but one that has been in use in the practice of a physician of eminence for many years . . . and so successfully as to produce many beautiful growths of hair, as also whiskers and moustaches in abundance. . . . The secret of its preparation has been purchased by Messrs. Warde & Co., and these gentlemen are giving to society at large what, until lately, has been confined to a limited circle—A REAL HAIR PRODUCER."—*Civil Service Gazette.*

**A beautiful Head of Hair, Whiskers, Moustaches and Eyebrows** positively produced by the use of

**WARDE'S CAPILLARE (The Real Hair Producer)**

(After a course of Warde's Capillare).

It preserves the natural colour of the hair; keeps it from THINNING; is a SPECIFIC for PREMATURE BALDNESS; and thoroughly eradicates scurf and dandruff. Its fragrance and purity, moreover, recommend it FOR DAILY USE, as the best dressing for the Capillature.

None genuine without Warde & Co.'s signature on the label, thus *Warde & Co.* Beware of those who copy the style of our Advertisements, and then "Caution" you that theirs have been so treated. Directions for use with each bottle.

Price, 2s. 6d. per bottle, three bottles 6s. 6d., Privately packed, carriage paid.

Can be obtained from all Chemists, per order on Wholesale Houses; or sent under cover, upon receipt of remittance, by **G. WARDE & CO., 15, Gt. MARLBRO' ST., LONDON, W.**

**WHISKERS**

Send for a Bottle, as it is guaranteed to effect this marvellous change in a few weeks.

Never fails.

**BEFORE USE. SAVILLE'S AFTER USE. CAPILLARY GERMINATOR** has been proved by hundreds to be the only real producer of Whiskers and Moustaches and Curer of Baldness. PRESS OPINIONS.—"Decidedly the most efficacious and rapid in its operation of any preparation of the kind. A thoroughly reliable Hair-Producer."—*London Press.* "Just what it professes to be—in effect."—*Irish Press.*

Of all Chemists and Perfumers. Sent to any address, carriage paid, free from observation, with testimonials, directions for use, &c., on receipt of 2s. 6d. Larger sizes, 4s. 8s., and 11s. Carriage paid, 1s. extra. **JOHN F. SAVILLE AND SONS, 146, Regent's Park Road, London, N.W.** Important Caution! Beware!—Many persons are copying our title and advertisements. This is the original and only genuine "Capillary Germinator." Buy no other. Above title (registered) is moulded in every bottle.

**KINAHAN'S LL WHISKY**  
**KINAHAN'S LL WHISKY..** Pure, Mild and Mellow, Delicious and Most Wholesome. Universally recommended by the Profession. The Cream of Old Irish Whiskies.  
**KINAHAN'S LL WHISKY.** Dr. Hassall says—"Soft and Mellow, Pure, well Matured, and of very excellent quality."  
**KINAHAN'S LL WHISKY.** Gold Medal, Paris Exhibition, 1878; Dublin Exhibition, 1865, the Gold Medal.—20, Great Titchfield Street, London, W.

**"OLD DR. JACOB TOWNSEND'S" SARSAPARILLA. THE BLOOD PURIFIER.**

This extraordinary Medicine has a singular influence upon the blood, which it enriches and purifies. It removes all pimples and blotches, purifies the system, and acts like a charm. As a sustaining and purifying tonic it is invaluable, and highly recommended in long-standing cases of indigestion, nervousness, coughs, colds, scrofula, gout, dropsy, and wasting of flesh. Sold by all druggists. Caution.—Get the red and blue wrapper, with the Doctor's head in the centre. No other genuine. In bottles, 2s 6d., 4s. 6d., and 11s.—131, Fleet Street, E.C.

**DINNEFORD'S MAGNESIA.**

The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for **ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, AND INDIGESTION,** and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**

**HOLLOWAY'S PILLS.**—Easy Digestion.—These admirable Pills cannot be too highly appreciated for the wholesome power they exert over all disorders of the stomach, liver, bowels, and kidneys. They instantaneously relieve and steadily work out a thorough cure, and in its course dispel headache, biliousness, flatulence, and depression of spirits. It is wonderful to watch the daily improvement of the complexion, as Holloway's Pills purify the blood and restore plumpness to the face which had lost both flesh and colour. These Pills combine every excellence desirable in a domestic remedy. The most certain and beneficial results flow from the occasional use of this regulating medicine. Even persons in health, or when following sedentary occupation, will find it an invaluable aperient.

SEND FOR A PRICE LIST OF

# JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

*For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms.*

No Cost for Motive-Power, which is obtained from the Stream of Water passing through the Rams.

No Oiling or Packing Required.

Made in sizes to raise from 300 to 500,000 Gallons per day.

This Advertisement will appear again on June 19.

This Ram for small working falls.

This Ram will force a part of the same water that works it, or will force clean water from a well or spring whilst worked by a stream of impure water. Rams on this principle can be supplied to force to a height of 1500 feet.

This Ram, for deep working falls, will force up one-third of the water passing through it

This Advertisement will appear again on June 19.

*Parties requiring a Water Supply should not too readily conclude that the quantity and fall of water, if any is available, is too small to work a Ram before consulting J. B.*

## TESTIMONIALS.

From the Right Honourable the EARL of GRANARD, *Castle Forbes, March 1, 1880.*—"The Hydraulic Ram erected for me at Castle Forbes has answered perfectly. Considering the very small fall attainable by the nature of the ground, it is a great success, and throws up water to a cistern on the top of a tower 80 feet high. When Mr. Blake first proposed to put it up I doubted the possibility of its succeeding, owing to the nature of the ground, but I have been most agreeably undeceived."

From Col. TREMAYNE, *Ferran-ar-Worthel, Cornwall, March 7, 1880.*—"The Self-acting Hydraulic Ram you erected here about two years ago is, I am pleased to say, working most satisfactorily, sending up water at the rate of 8000 gallons to a height of 185 feet, and a distance of more than 2000 yards. The quantity of water is as much as you undertook to deliver."

From W. SCARTH, Esq., *Agent to His Grace the Duke of Cleveland, Raby Castle, Darlington, July 16, 1878.*—"The Hydraulic Ram you supplied to His Grace the Duke of Cleveland in 1875 is a complete success. It worked for more than two years without once stopping, and throws more water than promised."

From JOHN TAYLOR, Esq., *The Rocks, Bath, August 22, 1878.*—"The Self-acting Hydraulic Ram you fixed here in March of last year continues to work well. It has only the same quantity of water and fall to work it as the water-wheel and pump which I used previously to force a height of 204 feet, and yet the Ram sends up more than double the quantity of water that the wheel did to the same height."

From Major STARKIE, *Lovely Hall, Blackburn, May 13, 1878.*—"Sir, I have great pleasure in testifying to the good qualities possessed by the Ram you erected here last year. It has done its work well, and not failed as the other Ram did, which was of a different construction, and supplied by a different firm. I consider that there are great difficulties to contend with here, but your practical mechanical knowledge, both as to the construction of the Ram and its situation here, overcame most of the difficulties that we had to contend against."

From JOHN PENNINGTON, Esq., *Enmott Hall, near Colne, December 21, 1863.*—"Sir.—The Self-acting Hydraulic Ram you supplied me with nine months ago continues in excellent condition. It receives water from a spring through a 2-inch pipe, of which it forces 3600 gallons per day of twenty-four hours to a height of 90 feet, exceeding all you promised, and far surpassing the water-wheel and force-pumps which it has displaced. Its cost is small, it occupies but little space (2 square feet), and in mechanical detail is simplicity itself. I have much pleasure in recommending it as a cheap and efficient method of raising water."

This view represents one Ram worked by water from a spring, and forcing it up to a Farm, Cattle Troughs, Kitchen Garden, and Mansion, all at different elevations, the highest being 444 feet, and to a distance of 2008 yards.

From the Right Hon. T. SOTHERON-ESTCOURT, *Estcourt Park, Gloucestershire, September 6, 1875.*—"You will be glad to hear, as I am to tell you, that your Self-acting Hydraulic Ram has worked exceedingly well and continuously since it was erected, more than twelve months ago. It is, in fact, perfectly successful." (The delivery pipe in the above case is 4200 feet long, with 120 feet rise.)

From *Deane-water, Wilmslow, November 27, 1873.*—"Dear Sir,—In answer to your inquiries respecting the Hydraulic Ram you supplied me with six months ago, I beg to state that I am more than satisfied with it, as it is in perfect order, sending up to the top of the house about 2000 gallons of water in the twenty-four hours, whereas you only contracted to deliver in that time 500 gallons. I have, therefore, every reason to be well pleased with your work, and more especially as I had a Ram supplied me by another maker which could not send up a single gallon of water to the height required, and a second maker informed me that no Ram with a fall of 3 feet could send up water to the distance required—namely, 120 feet. But yours is an accomplished fact, and does its work most effectually.—Yours, &c., L. HANMER."

From Mr. THOMAS MASON, *Allingtons Hall, Colne, September 30, 1871.*—"Sir,—Your Self-acting Hydraulic Ram gives me entire satisfaction; it has been at work about fifteen months, and has only been seen once during the last six months; it is forcing about 1400 gallons per day of twenty-four hours, to a height of 194 feet."

## TESTIMONIALS.

From Capt. GANDY, *Castle Bank, Appleby, February 11, 1880.*—"The Self-acting Hydraulic Ram you erected for me is an excellent example of strength and good workmanship. Whilst working with 2 feet 4 inches fall it forces water 73 feet high, and so far gives me every satisfaction. It will do more work in one day than the old Ram of another make could do in a week."

From JOHN WALKER, Esq., *Mount St. John, Thirsk, February 13, 1880.*—"In reply to your enquiry I am glad to inform you that the Hydraulic Ram you fixed here in May last has fully answered my expectations, and your promises as to the quantity of water it would force to a height of 135 feet. I consider it a very good machine, and superior to one I had in use previously."

From Captain TOWNSEND, *Wineham, February 10, 1877.*—"In answer to your enquiry, I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe, 900 yards long, at the rate of 80,000 gallons per day, although you only promised 50,000."

**JOHN BLAKE, ENGINEER, ACCRINGTON, LANCASHIRE.**

New Hardy Fern. MICROLEPIA ANTHRISCIFOLIA. A South African Fern, which for delicacy and beauty may be almost compared with the Lace Fern, Cheilanthes elegans; proves perfectly hardy, scores of plants having survived the past two winters with us in the open ground without the slightest artificial protection! It grows freely in any light rich soil, either in shade or full sunshine, and runs underground like the common Bracken, forming very pleasing tufts or edgings of light green, with very highly divided fronds, 6 to 9 inches high. As such it will be found very useful as an Edging for Bedding Plants, as well as for Greenhouse Decoration. That such a Fern should have borne the severe and protracted frosts of the winter of 1879-80, and again a temperature of 6 1/2° below zero last winter, with only a few inches of snow, is surprising indeed. We imported this pretty species three or four years ago, and can now offer well-established plants at 1s. 6d. each, or 15s. per dozen. JAS. BACKHOUSE AND SON, York Nurseries, York.

BEDDING PLANTS, & C. GERANIUMS, Bedding, Zonal and Nosegay, in choice sorts, our selection, 2s. 6d. and 3s. per dozen, 16s. and 20s. per 100. GERANIUMS, Bedding, Bicolor varieties, 3s., 3s. 6d., and 4s. per dozen. choice, for pot culture in summer or winter, twelve fine varieties, 4s. and 6s. Our collection is second to none, including the best sorts from all parts, home or foreign. AGERATUMS and LOEBELIAS, strong, and well hardened off from stores, 1s. per dozen, 5s. per 100. in pots, 2s. per dozen, 12s. per 100. CALCEOLARIA, Golden Gem, 2s. per dozen. DACTYLIS ELEGANTISSIMA, GOLDEN PYRETHRUM, SEDUMS of sorts, for Carpet Bedding, 1s. per dozen, 6s. per 100. HELIOTROPES, COLEUS, TROPEOLUMS, and SALVIAS, fine named sorts, 2s. per dozen, 12s. per 100. ANTIRRHINUMS, PHLOXES, PANSIES, and PINKS, fine named sorts, 3s. per dozen; 12 of each, 48 in all, 11s. ALTERNANTHERAS and IRESINES, of sorts, 2s. 6d. per dozen, 15s. per 100. BEGONIAS, Tuberosus, in great variety, 4s., 6s., 9s., and 12s. per dozen. CENTAUREA RAGUSINA, 3s. 6d. per dozen. CHRYSANTHEMUMS and FUCHSIAS in variety, 2s. 6d. per dozen, 15s. per 100. HERBACEOUS and ALPINE PLANTS, 12 in 12 sorts, 4s.; 50 in 50 sorts, 12s. DELPHINIUM, fine sorts, to name, 6s. per dozen. PANSIES and VIOLAS, for bedding, in great variety, 2s. per dozen, 12s. per 100. PLANTS, Stove, in great variety, 6s., 9s., and 12s. per dozen, our selection. Greenhouse, 6s., 9s., and 12s. per dozen, our selection. FERNS, Stove or Greenhouse, 9s. and 12s. per dozen, our selection. CATALOGUES post-free.

WM. CLIBRAN AND SON, Oldfield Nursery, Aittrincham. G. FREELAND has a large quantity of good strong healthy Plants for sale of Cattell's Eclipse, Adams' Early, Purple Sprouting and Miller's Dwarf Broccoli, at 4s. 6d. per 1000. Thousand-headed and Scotch Kale, at 3s. 6d. per 1000. East Ham, Enfield Market, Early Barnes, Cattell's Reliance, and Drumhead Cabbage, at 3s. 6d. per 1000. Brussels Sprouts, at 3s. 6d. per 1000. Packing free for cash with order. Nursery and Seed Establishment, Tonbridge.

VIOLAS, 20,000 fine strong plants:—cornuta, white } 5s. per 100, 45s. per 1000. Queen of Blues, } 5s. per 100, 45s. per 1000. LOBELIA, Emperor William, strong autumn-struck, from stores, 2s. 6d. per 100, 25s. per 1000; from single pots, 5s. per 100, 45s. per 1000. Cash only. Carriage and package free. H. J. HARDY, Stour Valley Seed Grounds, Bures, Suffolk.

To the Trade, HOME-GROWN TURNIP SEEDS. H. AND F. SHARPE invite the attention of the Trade to their fine selected Stocks of TURNIP SEEDS, which comprise, amongst others, the following excellent varieties, viz.—Sharpe's Improved Large Swede Sutton's Mammoth Purple-top Devonshire Grey Stone Sharpe's West Norfolk Swede Pomeranian White Globe Sutton's Champion Swede Lincolnton Red Round East Lothian Swede Stratton Green Round Green-top Yellow Aberdeen Stratton Green Round Golden Yellow Aberdeen White Stone or Stubble The quality is very fine, and the prices will be found very advantageous to purchasers. For further particulars apply to Seed Growing Establishment, Wisbech.

# CRYSTAL PALACE SHOW: PROTEST.

## MESSRS. PAUL & SON

Feel compelled to take the unusual course of protesting against the Award of the Judges in the Class for Nine Specimen Roses at this Show.

As Growers, Exhibitors, and Judges, for many years, of Roses, they have no hesitation in saying that their Collection was in every way superior to that placed before it.

This opinion was confirmed by nearly all the leading Plantsmen present at the Show.

## THE OLD NURSERIES, CHESHUNT.

# NEW ENGLISH ROSES for 1880.

## WM. PAUL & SON

(SUCCESSORS TO THE LATE A. PAUL AND SON—ESTABLISHED 1806),

PAUL'S NURSERIES, WALTHAM CROSS, HERTS,

BEG TO OFFER

The following NEW ROSES, strong plants, 7s. 6d. and 10s. 6d. each:—

**MASTERPIECE (H.P.)**—Magnificent bright rosy-crimson blooms; large, full, and of perfect globular shape. A seedling from "Beauty of Waltham." Growth vigorous, habit good, and foliage fine.

"Probably the finest Rose of the year."—*Gardeners' Magazine*.  
"A very full rosy-pink flower, of excellent form."—*Gardeners' Chronicle*.

**CROWN PRINCE (H.P.)**—Flowers bright purple, centres shaded with lurid crimson, very large and double, petals fine; excellent growth and habit. A most effective garden Rose, yielding large quantities of fine flowers, either for decoration or cutting, of a colour very scarce amongst Roses of its quality.

"Crown Prince, also raised at Waltham, claims special attention."—*Gardeners' Magazine*.

**LITTLE GEM (Moss)**—A miniature Moss Rose, which may be described as a crimson Mossy de Meaux. It forms compact bushes densely covered with small, double, crimson flowers, beautifully mossed. It is of charming effect in the garden, and most valuable for bouquets or vases.

"A charming little Moss Rose."—*Gardeners' Chronicle*.  
"Will make its way as a garden Rose, and be in request for cutting."—*Journal of Horticulture*.

**THE NEW FRENCH ROSES OF 1880**, 30s. per dozen.

**THE NEW ROSES OF 1879** (including Duchess of Bedford and Countess of Rosebery), 21s. to 36s. per dozen.

Good plants of the older Roses, in pots, for present planting and for greenhouse culture, 9s. to 18s. per dozen; £3 15s. to £7 per 100.

The same, of extra size, 24s. per dozen and upwards.

Priced Descriptive CATALOGUES post-free on application.

Visitors by Railway can enter the Nurseries from the platform, Waltham Station, Great Eastern Railway, half an hour's ride from London.

Now Ready—Good Spring-sown Cabbage and Other PLANTS, &c.

**GEE'S** superior Bedfordshire-grown Plants, &c., grown from his far-famed selected stocks, can again be supplied in any quantities, as follows, for cash with orders:—  
**CABBAGE PLANTS**.—Early Enfield, Nonpareil, Large Drumhead, Thousand-head, and Red Dutch.  
**SAVOY**.—Large Drumhead, and Dwarf Green Curled.  
**SCOTCH KALE**, **BRUSSELS SPROUTS**, finest.  
**KOHL RABI**.—Large Green.

All the foregoing at 4s. per 1000.

**BROCCOLI**.—Purple Sprouting, Adams' Early White, Knight's Protecting, and Wilcox's Large Late White, 5s. per 1000.  
**CAULIFLOWER**.—Veitch's Giant, true, 7s. 6d. per 1000; Early London and Walcheren, 7s.

**LETTUCE**.—Old Brown Cos, Victoria, Drumhead, and Paris Green Cos, all at 5s. per 1000.

Packages 6d. per 1000 extra.

F. GEE, Seed and Plant Grower, Bugleswade, Beds.

## MATRICARIA INODORA PLENA (NEW DOUBLE MAY-WEED).

Figured in *Gardeners' Chronicle* of December 13, 1879. Will bear the severest winter without protection. If grown in a rich border it will flower in the greatest profusion from June till October, and the flowers, which are pure white, are equal to those of a Pompon Chrysanthemum. It is invaluable for cutting. 1s. 6d. each, 12s. per dozen, 75s. per 100. Engraving sent with three plants. The usual discount to the Trade.—Messrs. DICKSONS AND CO., 1, Waterloo Place, Edinburgh.

To the Trade.

**YELLOW and WHITE BANKSIAN ROSES**, good, in 4½-inch pots, 75s. per 100; **MABEL MORRISON**, **REINE MARIE HENRIETTA**, 12s. per dozen; **MARÉCHAL NIÉL**, extra size, in 7-inch pots, 24s. per dozen.

GEORGE COOLING, The Nurseries, Bath.

## P L A N T S. VEITCH'S AUTUMN GIANT CAULIFLOWER,

4s. per 1000.

**BRUSSELS SPROUTS**, 3s. per 1000. Guaranteed to be strong and well-rooted. Post-office Order, or Cheque with order, as no consignments are in any instance made without a previous remittance order of R. BATH, Crayford; or JOHN BATH, Covent Garden, W.C.

Important Notice.

**ROSES—ROSES—ROSES**.—Hybrid Perpetuals, Tea-scented, and other Roses in pots, for blooming in conservatory, or planting out at once, fine strong healthy plants, including A. Sisley, C. Mermet, C. Paris, C. Devonensis, I. Pirola, J. Ducher, Lamarque, Mad. Lambert, Niphetos, S. Hibberd, S. d'Elize, S. P. Neron, &c., 12s., 15s., 18s., and 24s. per dozen. Also a very fine lot of Bennett's Pedigree Roses, including the new striped Rose, American Banner, 24s. per dozen. Fine plants of American Banner, 5s. each. LIST gratis on application.  
J. HOUSE, Eastgate Nurseries, Peterborough.

Bedding Plants, &c.

**F. AND A. SMITH** offer the undernoted in well established hardened plants, at low prices:—

Alternantheras	Fuchsias
Ageratums	Geraniums, best sorts
Coleus in variety	Heliotropes
Cupheas	Lobelias
Cobaea scandens	Petunias
Calceolarias	Tropaeolums
Dahlias	

The Nurseries, West Dulwich, S.E.

## MESSRS. THOMAS CRIPPS AND SON

are now sending out the undermentioned three new CLEMATISES, all of the viticella or Jackmanni section:—  
**EARL BEACONSFIELD** (T. Cripps & Son).—A splendid hybrid, described in the *Gardeners' Chronicle*, June 22, 1878, as "a beautiful flower of a rich royal purple colour, and splendid form. This variety belongs to the viticella type, and is remarkably richly coloured." First-class Certificate Royal Horticultural Society. Price 15s. each.

**LILACINA FLORIBUNDA** (T. Cripps & Son).—Pale grey-lilac, deeply veined; flowers the size of C. Jackmanni, but having six petals and of perfect shape. This is the lightest variety and most abundant bloomer in this section. An admirable contrast to C. Jackmanni for bedding purposes. Price 10s. 6d. each.

**OTHELLO** (T. Cripps & Son).—Flowers medium, a good shaped six-petalled variety. Late and very free flowering; colour dark velvety purple. Price 10s. 6d.

Discount to the Trade.

Plates of "Earl Beaconsfield" and "Lilacina grandiflora," 2s. 6d. each.

The Tunbridge Wells Nurseries, Kent.

## New Coleus, Petunias, and Fuchsias of 1879 and 1880.

**THE EXECUTORS OF H. WALTON** beg to offer the following NEW COLEUS of 1880:—Duchess of Teck, Empress of Germany, James Burnshaw, Juno, Lovely, Royal Purple, and Sensation, 1s. each. New Varieties of 1879:—Aurora, Butterfly, Firefly, Glow, Magic, and Sparkler, 8d. each, strong, well rooted plants; the thirteen varieties, 10s.

New Double Fringed PETUNIAS of 1880. These have been selected with great care from an extensive collection, and can be confidently recommended as being a great advance on anything hitherto offered. Strong, well-rooted plants, 2s. 6d. each, 24s. per dozen varieties, post-free.

New Double Fringed PETUNIAS of 1879, 1s. each, 9s. per dozen varieties.

New FUCHSIAS, 1879 and 1878, very choice sorts, 9d. each, all post-free, for cash with order.

A fine collection of BEGONIAS, Tuberous-rooted and Ornamental-leaved, Half Specimen ERICAS, &c., the best exhibition varieties.

For descriptions of the above see CATALOGUE, sent post-free, on application.

Edge End Nursery, Brierfield, near Burnley.

Bennett's Pedigree Roses.

Should be in every Collection.

**GEORGE COOLING** has pleasure in offering fine plants coming into bloom of these desirable varieties, viz:—

Beauty of Stapleford	Jean Sisley
Duke of Connaught	Michael Saunders
Duchess of Connaught	Nancy Lee
Duchess of Westminster	Pearl
Honourable George Bancroft	Viscountess Falmouth

The complete Set, 25s., basket and packing free for cash with order. Usual discount to the Trade.

New LIST of Roses in pots, Clematis, &c., post-free.

The Nurseries, Bath.

*Awarded First-class Certificate Royal Horticultural Society, May 25, 1880.*

Now being Distributed!  
NEW ZONAL PELARGONIUM,  
**WEST BRIGHTON GEM.**  
Unsurpassed for Winter Flowering.

This has been awarded a First-class Certificate as a New Plant by the Brighton and Sussex Horticultural Society, and a Cultural Commendation by the Royal Horticultural Society. Price 10s 6d each, two for 20s (usual allowance to the Trade). As the stock is limited, orders will be booked and executed in strict rotation.

For further particulars see the *Times* of December 17, 1879, the *Journal of Horticulture* of December 18, the *Gardeners' Chronicle* of December 20, and for full description and CATALOGUE of Alternantheras, and other Carpet Bedding Plants, apply to

WM. MILES, West Brighton Nurseries, Cliftonville, Sussex.

**MILES' HYBRID SPIRAL MIGNONETTE.**

Extract from the *Journal of Horticulture*:—"This is the finest Mignonette that has come under our notice. It is the same variety that attracted the attention of Her Majesty the Queen, at the great Exhibition at South Kensington."

Plants of the above splendid variety, established in pots, 6s per dozen.  
WM. MILES, West Brighton Nurseries, Cliftonville, Sussex.

**CABBAGE PLANTS, &c.**

CABBAGE, SAVOY, CAULIFLOWER,  
BRUSSELS SPROUTS, BROCCOLI,  
CELERY.

List of sorts and prices on application. To  
CRANSTON'S NURSERY and SEED COMPANY  
(Limited), King's Acre, Hereford.

**DANIELS' Unrivalled Strains of Choice FLORISTS' FLOWER SEEDS, post-free.**

"In the rearing of Florists' Flowers from seed the first essential point is to secure carefully hybridised seed, saved from the finest flowers of the finest kinds, the chances of success in raising some really good varieties being vastly greater from a few plants from seed of the choicest quality, than from a large quantity raised from seed of an inferior description."

**JOHN COWAN, The Vineyard and Nurseries, Garston, near Liverpool,** has still on hand a fine Stock of Fruiting and Planting CANES of Muscat of Alexandria, Bowood Muscat, Mrs. Pince, Gros Guillaume, Burchard's Pince, and Madresfield Court. Also Planting Canes of several other varieties. CATALOGUE free. The Trade supplied.

**IMPORTANT NOTICE.**

**J. CHAMBERS,**  
Westlake Nursery, Isleworth, W.

Is now prepared to send out his two new Hybrid Bulbous BEGONIAS, ROYAL STANDARD and AVALANCHE, in nice healthy little plants at 15s. each. They received First-class Certificates, June, 1879, both at South Kensington and Richmond. These are undoubtedly the two grandest Hybrid Begonias ever offered: see *Gardeners' Chronicle*, June 28, 1879. Both varieties can be seen in flower at the nursery.

Also a new White LOBELIA MAGNIFICA ALBA. The habit is identical with that well-known variety magnifica. As a pot plant for general decoration with Lycopodium, Maidenhair, and other small Ferns, I know of nothing to equal it. Nice plants at 1s. 6d. each, or 12s. per dozen.

Usual allowance to the Trade. Terms cash. Post-office Orders payable at Spring Grove, Isleworth, W.

**Fibrous Peat for Orchids, &c.**

**BROWN FIBROUS PEAT,** best quality for Orchids, Stove Plants, &c., 26 6s. per truck.

**BLACK FIBROUS PEAT,** for Rhododendrons, Azaleas, Heaths, American Plant Beds, 15s. per ton.

Delivered on rail at Blackwater, S. E. R., or Farnborough, S. W. R., by the truckload. Sample bag, 4s.; 5 bags, 20s.; 10 bags, 36s. Bags, 4d. each.

Fresh SPHAGNUM, 10s. 6d. per bag.

**WALKER AND CO., Farnborough Station, Hants.**

**CHOICE IMPORTED ORCHIDS.**

**MR. J. C. STEVENS** will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on TUESDAY, June 8, at half-past 12 o'clock precisely, by order of Messrs. HUGH LOW & Co., Imported ORCHIDS, just received from Burmah, in large quantities, and in best possible condition, comprising:—CYPRIPEDIUM PARISHII, DENDROBIUM BENSONIÆ, a grand lot, amongst them a splendid mass, 2 feet across, with upwards of 100 bulbs; D. THYRSIFLORUM, D. LUTEOLUM, D. PARISHII, D. CAPILLIPES, D. SENILE, D. PRIMULINUM, D. EBURNEUM, AERIDES VIRENS DAYANUM, SACCOLABIUM BLUMEI MAJUS, &c.

At the same time will be offered fine plants of CYPRIPEDIUM ARGUS, C. HAYNALDIANUM, C. BONALLII, AERIDES QUINQUEVULNERUM, AERIDES CRASSIFOLIUM, CATTLEYA DOWIANA, VANDA LAMELLATA BOXALLII, V. DENISONIANA, CYMBIDIUM LOWIANUM, DENDROBIUM SUPERBUM GIGANTEUM in flower or bud; 200 CATTLEYA LABIATA SPECIOSISSIMA varieties, and other choice ORCHIDS.

Also will be offered, for account of Messrs. PARSONS, SONS & Co., Flushing, N.Y., a quantity of rare JAPANESE PLANTS, in good health, and well established in pots, consisting of Variegated Evergreen OAKS, Golden HOLLIES, Variegated-leaved CAMELLIAS, and DAPHNIPHYLLUM GLAUDESCENS.

May be viewed the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN,  
LONDON, W.C.

**VALUABLE IMPORTED ORCHIDS.**

**MR. J. C. STEVENS** has received instructions from Mr. F. SANDER to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, June 10, at half-past 12 o'clock precisely, very valuable Importations of ORCHIDS, consisting of large masses of CATTLEYA SKINNERI, LYCASTE SKINNERI, BARKERIA SKINNERI, ODONTOGLOSSUM VEXILLARIUM, O. LEOPOLDI, EPIDENDRUM MACROCHILUM ATROPURPUREUM, CATTLEYA BICOLOR, LELIA PUMILA, CATTLEYA CANDIDA, splendid clumps of the beautiful THEREPOGON PALLIDUS, from India, in flower, and various other ORCHIDS.

May be viewed the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN,  
LONDON, W.C.

# NEW "CHESHUNT" RAISED and ENGLISH SEEDLING ROSES, For Spring of 1880.

## PAUL & SON, THE OLD NURSERIES, CHESHUNT,

Beg to announce for delivery at once, a very excellent set of NEW ROSES. They cannot but quote the pleasure the many encomiums passed on their great stride in colour, H.P. DUKE OF TECK, and may be pardoned for pointing out that the New Roses previously distributed by the firm may now be seen in every garden, and in most stands at the Rose Shows. DUKE OF EDINBURGH, CHESHUNT HYBRID, SULTAN OF ZANZIBAR, S. REYNOLDS HOLE, DUKE OF CONNAUGHT, JOHN BRIGHT, MRS. LAXTON, and CHARLES DARWIN are guarantees of the careful trial Roses have to go through before being sent out from Cheshunt.

### H.P. DUKE OF TECK (Paul & Son).

*First-class Certificate, Royal Horticultural Society; First-class Certificate Alexandra Park Rose Show; First Prize, Best New Roses not in commerce, National Society Show, Manchester, 1879; First-class Certificate, Richmond, 1877.*

Bright crimson-scarlet, clear and distinct in its vividness of colour beyond anything else; a real march towards a true scarlet Rose. The flower is large, very double, of good bold pointed globular form. Very free flowering habit, and bold erect growth, with grand foliage; probably the finest Rose we have yet raised. Strong plants, in pots, 10s. 6d. each. Figured in the *Garden and Floral Magazine*; plates 1s. each.

#### OPINIONS OF THE PRESS.

"To Messrs. Paul & Son, Cheshunt, a First-class Certificate was awarded for a splendid new flower of the Duke of Edinburgh type, and the nearest approach yet made to a scarlet."—*Gardeners' Chronicle*—Report of the Royal Horticultural Society's Show, July 12.

"Conspicuous in these stands was a new H.P., named Duke of Teck, a colour the nearest approach to scarlet, of excellent size and brightness of colour, besides being a strong grower. This is the best seedling of the season so far."—*Gardeners' Chronicle*, July—Report of Alexandra Palace Show.

"Only one Certificate was awarded, viz., for Duke of Teck, a seedling Rose of Duke of Edinburgh race, but much brighter in colour, brighter even than John Bright, the smooth crimson petals being suffused with scarlet. Being a free grower and bloomer, the Duke of Teck must be pronounced a Rose of great promise."—*Journal of Horticulture*.

"In Messrs. Paul & Son's 43 trebles, the best were Glory of Cheshunt and Duke of Teck."—*The Garden*.

"Extremely brilliant, and the nearest approach obtained yet to a good scarlet Rose."—*Journal of Horticulture*—Report of Norwich Show.

"Mr. Hawtreys prize for the best seedling English Rose, not yet in commerce, was won by Messrs. Paul & Son with H.P. Duke of Teck, a very vivid scarlet. The plant, removed from the open ground, was strong and robust, and of good habit."—*Journal of Horticulture*—Report of Manchester Show.

"Messrs. Paul exhibited a box of the very brilliant Duke of Teck, so bright that it put their Duke of Edinburgh in the shade, and even in this cloudy year, when the Duke of Edinburgh almost always seems shaded, this most brilliant flower was of the clearest and most intense scarlet."—*Journal of Horticulture*—Report of Reigate Show.

### H.P. GLORY OF CHESHUNT (Paul & Son).

This is a seedling from CHARLES LEFEBVRE, with flowers of a rich shaded crimson, very bright and vivid—perhaps hardly as full, but a fine early show Rose. Its main value, however, will be for its grand qualities as a bold shrub Rose, or for pillars or climbers; it is almost everblooming and evergreen, and stands now about the nursery as a large bush 6 feet high and as much through. Price, 7s. 6d. each.

#### OPINIONS OF THE PRESS.

"Glory of Cheshunt is a rapid yet strong growing plant, with fine foliage and flowers, similar in colour, and nearly as fine as Reynolds Hole: so that it will rate at once both as the finest dark climber and as an exhibition Rose."—*Journal of Horticulture*.

"In Messrs. Paul's 43 the best were Glory of Cheshunt and Duke of Teck."—*The Garden*—Report of Royal Horticultural Society's Exhibition.

Both these Roses have stood unprotected here this severe winter, and remain absolutely uninjured in the slightest degree by the frost.

### EARL OF BEACONSFIELD (Capt. Christy and Paul & Son).

Light cherry-carmine, shape perfectly exquisite, deep close centre, with beautifully recurved outer petals, very double. A fine exhibition Rose, but not of vigour enough to make a good garden Rose. *Second Prize Seedling Rose, National Rose Society.* Price, 7s. 6d. each.

#### OPINIONS OF THE PRESS.

"A grand Rose as regards growth, foliage, and flowers, and will go far towards immortalising the name of Capt. Christy, by whom it was raised."—*Journal of Horticulture*.

### DR. HOGG (Thomas Laxton, Esq., and Paul & Son).

Deep violet, nearest to the blue colour sometimes desired in Roses, pretty shell-shaped petal, very vigorous habit, and very hardy. Price, 3s. 6d. each.

The Set for £1 5s. Usual discount to the Trade when three of each sort taken.

## NEW FRENCH ROSES of 1880.

Strong plants now ready, 3s. each, 30s. per dozen. Descriptive LIST on application.

### BENNETT'S NEW ENGLISH HYBRID TEA ROSES.

3s. 6d. each, the set of eight best for 25s.

BEAUTY OF STAPELFORD.  
DUKE OF CONNAUGHT.  
DUCHESS OF CONNAUGHT.

DUCHESS OF WESTMINSTER.  
HONOURABLE GEORGE BANCROFT.  
JEAN SISLEY.

MICHAEL SAUNDERS.  
VISCOUNTESS FALMOUTH.

### NEW ENGLISH ROSES of SPRING, 1879.

3s. 6d. each.

CHARLES DARWIN.  
COUNTESS OF ROSEBERY.

DUCHESS OF BEDFORD.  
DR. SEWELL.  
WILLIAM WARDEN.

HARRISON WEIR.  
MARQUIS OF SALISBURY.

### BEST NEW FRENCH and ENGLISH ROSES of 1879.

2s. 6d. each; 24s. per dozen.

H.P. CLIMBING BESSIE JOHNSON.  
EDWARD MORREN.  
COMTESSE DE CHOISEUIL.

H.P. SOUVENIR DE VICTOR VERDIER.  
WILLIAM KEILE.

#### HYBRID TEAS.

REINE MARIE HENRIETTE.  
MADAME ETIENNE LEVET.  
MADAME BRIGETTI VIOLET.

PAUL & SON are preparing a Special Supply for Planting in June and July,

Strong plants, in 48 pots, to bloom in autumn, at 18s. per dozen, of all the best Tea-scented Roses. Extra strong plants of the leading Noisette and Climbing Tea Roses, such as Maréchal Niel, &c., at 42s. to 84s. per dozen.

*Cut Roses can be supplied nearly all the year round. Prices on application.*

Choice Cut Cheshunt Roses, during June and July, delivered free in London, or on G.E.R., at 20s. per 100.

**Gardeners' Chronicle.**

SATURDAY, JUNE 5, 1880.

GROSVENOR GALLERY.

THE present exhibition of pictures at the Grosvenor Gallery bears a similar relation with those of former years to the neighbouring annual exhibition at the Royal Academy. The number of pictures at the Grosvenor is much smaller than the collection at Burlington House; but one no sooner enters the rooms of the former than an impression is received that the pictures are of a generally superior class in comparison with those seen on the walls of the latter. No pictures are hung high and almost out of sight in the Grosvenor rooms, and this is a great advantage, as all the pictures are easily visible. Nothing is more provoking and wearisome than first trying to decipher the number of some picture placed near the ceiling, then looking it out in the catalogue, and too often finding that after all the picture is of no special interest, or is possibly a portrait of some individual one never before heard of. There are portraits at the Grosvenor, but we can say with truth that there are very few portraits without some interest attached to them, either on account of the person painted, the painter, or the manner of painting.

If the pictures are followed in the sequence of the numbers, the visitor comes upon a group of portraits on first entering the West Gallery, and a more remarkable and excellent series we have seldom seen. 2, "Portrait of W. Holman Hunt, Esq." W. B. Richmond, is one of the most admirable examples of this artist's work we have seen. The general effect of the picture is greatly aided by the broad, simple black frame. As a rule picture-frames (and especially gilt frames) are atrocious in design and dimensions, and too often have a tendency to ruin a picture. This portrait is on the right of a doorway, and we will break through the sequence of the numbers to refer to a picture on the other side of the same doorway, painted by W. Holman Hunt himself—89, "Portrait of Cyril B. Holman Hunt." The two pictures are as unlike as possible, the latter being crude and staring in style and furnished with an extraordinary frame on which are models of Apples life-size (one cut in two, showing the pips): these Apples are gilt, and introduced with profuse white blossoms and leaves. Such treatment of a picture cannot be right; it is a wonderful frame with a picture inside, reminding the spectator of some of Mr. Whistler's productions, where, if the picture took ten minutes to paint, the frame must have taken ten hours to decorate with similar material. In 9, 10, 11, are three other portraits, by J. Bastien Lepage; these are in different styles, but all excellent, the most remarkable being that of Middle. Sarah Bernhardt. The lady is shown in profile, with a statuette in her hands. This picture is furnished with a broad and remarkable frame in metal, but as the colour is very low and dull it is not obtrusive, but suits the picture. In 19 we have a portrait of Professor Huxley by A. Legros, exhibited,

as many similar portraits have been of late years, without a background; and in 40 a portrait of Charles Darwin, by W. B. Richmond, the painter of W. Holman Hunt's portrait in No. 2. Neither of these two portraits strike us as being specially life-like, and Charles Darwin looks strange in his profuse crimson academical robes. In 20, "The August Moon," by Cecil Lawson, we have a very large and roughly executed landscape of a full moon shining over a swampy vale; and in a neighbouring picture close by, 23, "The Voice of the Cuckoo," painted by the same artist. Opinions will be probably divided as to the merits of these pictures; that they have beauties of their own no one can deny, and that they show facility of execution is also apparent. They are, however, extremely rough, with no attempt at definition of objects, and the figures in the latter picture are ill-drawn and uncouth-looking. 18, "Plums," 24, "Quinces," both by W. Hughes, are two excellent pictures of branches of these fruits, placed upright in china jars; both are drawn and painted with great fidelity to Nature, but we think the leaves have been less carefully studied than the fruits in both instances. 31, "The Waters of Lethe," R. Spencer Stanhope, is a well-conceived and ambitious picture, in the style of E. Burne-Jones, of which artist's works there are far too many imitators in the Grosvenor Gallery. The execution does not equal the generally good conception of the design, for, apart from the figures, the rocky foreground is very curious, and still more curious is the flowery garden in the distance. The picture repeats many of the odd vagaries of some masters of the old Italian school, and one figure on the right, taking an awkward "header" into the "waters of Lethe," will remind visitors of the picture in the last year's "Old Masters," where a similar figure was taking a "header" into an element of a different nature. The faces and feet have been studied from Burne-Jones, and though the figures are in many places out of drawing the picture shows considerable genius. Wretched individuals of both sexes are pacing across the picture from left to right and diving into a pool; one plunger appears to have come to grief, for nothing but the soles of this person's feet are visible above the water-line: the refreshed bathers are reposing in groves and gardens in the distance, and pacing from right to left. In 49 and 54 we have two magnificent portraits by J. E. Millais, R.A., two of the finest we have seen from the brush of this master of portraiture. At 51, 52, and 53 are three admirable little gems by L. Alma Tadema. In all, especially the two first, the effect of light and shade is excellent; the pictures are named respectively, 51, "A Question," a Roman black-haired youth at full length on a stone seat gently twitching the garment of a fair-haired girl, and asking no doubt "the" question; 52, "A Garden God," a dancing female figure before a small altar, from which smoke ascends to the top of the picture, all placed in the shadow of a wall with small gleams of brilliant sunlight here and there, and a clear sky above; and 53, "A Pastoral." Above these three exquisite little works is placed 50, "Marsyas and Apollo," J. M. Strudwick, a good picture in the Burne-Jones style, but very inferior to the master's work, and in marked contrast with the three small pictures beneath. Reference may be made to the ill-drawn plant nonentities in the foreground of "Marsyas and Apollo;" if plants are required at all, surely it is better to take them from a garden than from some young lady's sampler. 70, "Last Gleanings," is an uncommonly good picture of a late autumn evening with cloudy sky, and a group of rustics proceeding homewards with their last gleanings; the picture is well and boldly executed. 72, "After a Gale," and 76, "Half a Gale," both by

H. Moore—the former a view of sea only, with sky clearing; the latter, the sea with a few ships in the distance and birds. These two pictures are remarkable examples of Mr. H. Moore's great power as an artist; the sea and sky in both pictures are masterpieces of positively accurate yet unlaboured portrayal of natural phenomena.

Passing to the East Gallery we get two pictures by W. T. Mueckley—98, "May," 103, "Fruit and Flowers." Although we have often had reason to praise this artist's admirable work, we think these two subjects show a greater mastery of drawing and painting flowers and fruit than any works we have hitherto seen from his brush. 98 represents some large branches of Hawthorn in a glass globe or vase: it would be difficult to surpass the beautiful drawing and painting of this picture. The glass globe is likewise a remarkable piece of truthful reproduction. 103 represents Oranges in blossom and the fruits in different stages of growth. Like the last, it is a perfect piece of work, and worthy of close study. 100, the "Grass of the Field," is an Eastern landscape of great beauty, with a foreground of flowers, remarkable for its evident truth to Nature, and its rich and harmonious colouring. 111, "Truth and the Traveller," Walter Crane. We should have expected greater care and accuracy in drawing from this well-known artist. If the two figures are removed from consideration, it will be seen that the architecture, perspective, and Acanthus plants, are by no means what they should be. The two figures are of the Grosvenor Gallery type, apparently derived from studies of the mannerisms of Holman Hunt and Burne-Jones. "Truth" is particularly ill-favoured and scraggy in her nakedness, but as she is stated in the *Catalogue* to have "wandered long in dens and caves," this may account for her angular and cadaverous aspect. The picture, however, like the other works by Walter Crane, shows considerable power of drawing, principally of the archaic kind. We have now reached "The Golden Stairs," by E. Burne-Jones—a galaxy of beautiful damsels descending a narrow and winding staircase without handrails. The figures have white drapery and naked feet, and lightly descend the stairs in "lines and forms of wondrous art." The figures carry instruments of music in their hands, and one or two of the ladies are striking a last chord. As a mystic picture of beautiful maidens gracefully descending from an upper to a lower storey the picture may be pronounced a very fine one. As to its meaning we cannot give one; it is like a "song without words," each spectator may put his own interpretation upon the subject before him. It may perhaps be considered invidious to mention the pale amber "stairs;" they are drawn with great regard to detail, so that a skilful builder could construct a somewhat similar structure. In a mystic picture of this nature would it not have been better to have kept the stairs less obtrusive, not to have given all the joints of the stairs, the stones of the floor, and the walls of the ugly corner underneath which no broom could ever reach. The exigencies of the composition might have required a flight of the nature drawn, but why, being a structure impossible of descent for heavenly or earthly maids, is it detailed with such extreme care? 125, "Omnia Vincit Amor," G. H. Boughton, A.R.A., represents a courtly knight of the middle-ages in a woody place playing sweet music to a lovely keeper of swine. It is clearly not a case of the "selection of the fittest" as even the page who holds the horse in the distance can plainly see. This is a very good picture, well drawn and painted; the face and position of the feet in the pig-tending beauty are very amusing.

In the Sculpture Gallery we have in 195, "Sunflowers," and a similar subject close by in 291, by G. Hart Taylor. Both are decor-

ative pictures, dull in colour and outlined with black: they are not of the first class. 202, 203, 204, "Portraits in red chalk of the Children of Prince and Princess Christian," are very poor productions, and very different in power from other portraits and sketches in the exhibition. 209, "Study of Pomegranate Flowers," Miss M. Corkling, and 211, "Nasturtiums," J. M. Jopling, are poorly executed little pictures, the nature of the plants not being properly apprehended by the painters. 214, "Azaleas," Miss Maud Nafel, is superior to the two last, but the subject of Azaleas in this style has been exhausted long ago. There are several other little pictures of flowers in the Water-Colour Gallery, but they call for no special remark, being as a rule neither very good nor very bad, and too similar to the little productions of the same class in the Royal Academy and elsewhere. The three pictures by R. Doyle in this gallery, 238, 239, 240, will prove attractive, especially the last and largest of the three—"The Battle of the Elves and Frogs," with its droll and amusing description. The picture is in Doyle's best style, admirably drawn and full of quiet humour.

## New Garden Plants.

### DENDROBIUM TETRACHROMUM, n. sp.\*

This is a Borneese novelty, introduced by Messrs. Veitch quite lately, through their collector, Mr. Curtis. Its stem is evidently rather long, thin, and terete. The piece at hand consists of a dozen of joints. The flower is white in general, and much in the way of the flowers of *Dendrobium moniliforme* (true japonicum, not my *Linawianum*, the so-called elder *D. moniliforme* of gardeners), and *aqueum*, Lindl. It has, however, a very acute chin, flowers from the old stems, and with a longish rather narrow lip. This organ is washed with ochre-yellow before the point, and at the base of the median lobe there at a black-purplish radiating blotch; the back of the chin is green: thus giving four colours, whence the name is taken. *H. G. Rehb. f.*

### MASDEVALLIA VESPERTILIO, Rehb. f.

This is one of the *Chimæra* section, with flowers usually equalling those of the better varieties of *M. Nycteria*. It is spotted on a pale ground like a leopard, and ranks in the small group of the *Chimæras* with *M. bella* and *Nycteria*, having the same lip with a marvellous dilatation at its anterior part. Mr. C. F. Lehmann was successful in bringing this rare thing over alive. *H. G. Rehb. f.*

### ODONTOGLOSSUM CRISPUM LEHMANNI, n. var.

This is a rather curious plant, much smaller than the Bogotese one, rather narrow leaved, and with a distinct inclination to produce branched inflorescences as that celebrated herculean plant does in Sir Trevor's Orchid paradise. Mr. C. F. Lehmann, the successful discoverer of this variety, saw as many as fifty flowers in one panicle. There is usually purple and brown tint in the flowers. *H. G. Rehb. f.*

## NOTES FROM A LANCASHIRE GARDEN.

May 23.—This last winter has been almost more hard upon us than that of 1878-79. I have had to cut away all the branches but one of the large *Buddleia*, and very unhappy it is looking, holding out its one remaining arm like a signal of distress. A *Gum Cistus*, which year by year has grown and flourished and blossomed, is all but killed. The *Clematis* that trailed round the withies in the garden bed, and the *Clematis* that climbed up the house, are both cut down to the roots, and the *Escallonia* is quite killed, root and branch. Several of my standard *Roses* are only dead dry sticks, and various other plants and shrubs are sick unto death.

And then this dry weather, with its shrivelling east winds, makes matters worse. Nothing comes

\* *Dendrobium tetrachromum*, n. sp.—Affine *Dendrobium aqueum* caule teretiusculo, foliis dejectis florido, racemo uni-seu bifloro, mento extintoriformi; sepalis ligulatis acutis; tepalibus rhombicis obtusis, labello trilobo, lobis lateralibus semiobovatis denticulatis, lobo antico oblongo ligulato obtuso undulato, jugo calloso inter lobos laterales; columna apice tridentata.  
Inter *D. moniliforme*, Sw., verum (nec *Linawianum*, Rehb. f., *moniliforme*, Lindl.), ac *aqueum*, Lindl., medium. Illius caulis tenuis, sed meatum extintoriforme, nec obtusissimum, hujus prope labelum, ad lobum anticum multo longior, mentum multo magis argutum et flores non exescentibus foliatis *H. G. Rehb. f.*

out as it should, leaves turn brown, and a sort of blast destroys whole branches. The wall fruit is looking miserable : of Peaches and Nectarines and Apricots there will be hardly any, and the Plums, which promise better, are getting infested with insects. There is greenfly among the Gooseberries, and the Currant caterpillar is eating circles in the leaves of the black Currant.

Nor have my vineries escaped. One night we found that a Canon Hall Muscat and two pot Fig trees were all but entirely destroyed. It was a blast, but what a blast is I cannot tell. The two Fig trees were on a line with the Muscat; one seems quite dead, but the other has now thrown up a shoot. As for the Muscat, one of its branches is entirely killed, and the other is killed for two-thirds of the length.

I have other disappointments in the vineries—the big Orange tree never showed so little flower, and from the Lemons I have never yet been able to get any flower. A Pomegranate also refuses to flower, though it looks vigorous enough. Can any of your readers give me any hints as to the management of Lemons and Pomegranates? The *Clethra arborea* is, however, looking very healthy, and a Passion-flower which trails along the wall of the second vinery is laden with blossom.

Out-of-doors the flowering shrubs are less beautiful than I ever knew them. Of Lilacs I have scarcely any, and only the Berberies (of some three different kinds) and the yellow Ghent Azalea are behaving as they should. The double Gorse, which used to be so ornamental at this time of year, has all been killed, and even the Thorns are less full than usual. The Horse Chestnuts, too, hold up fewer lights of waxen blossom than is their wont—in short, I never knew the shrubberies so bare of interest before at this time of year.

The walled flower garden, however, never fails me utterly, and it is now gay with blue masses of *Myosotis dissitiflora*, among which we find mixed here and there a patch of the white *Myosotis sylvatica*. Then there is a bed of large double Wallflowers of great size and beauty, almost the handsomest I ever saw; and then in another week there will be beds of Anemones and Ranunculus, and then for the Roses and all the summer flowers. Meanwhile there is every day something new to notice on the herbaceous borders. The Snowflakes and the starch Hyacinths are passing away, and the Auriculas and Polyanthus, but our losses are less than our gains. I once observed that the flowers of winter are chiefly white, and it has lately occurred to me that the flowers of spring are chiefly yellow. At this moment we have yellow Alyssum, yellow Wallflower, and yellow Asphodel, the beautiful double Marsh Marigold, which is new to me, and the Golden Ball, *Trollius europæus*. What a delightful old flower this Golden Ball is! You may see it, but not often, in old gardens, but you may also see it growing wild in some of the loveliest scenery of Wales. In one of Campbell's prettiest poems he says how he loves the "wildings of Nature"—

"For lulling me back into dreams  
Of the blue Highland mountains and echoing streams,"

and this the Golden Ball can always do for me. I have found it growing near an old bridge that spans the outlet of a wild lake, and I have found it in a little glen half covered with the spray of a rushing mountain stream.

May 28.—At last the rain has come, and everything is looking happy and scenting the air with sweet spring odours. I have been walking through our little wood and find the Blue Bell and another grey Scilla, the precise name of which I do not know, in great beauty, though rather trodden down by the feet of the rook-shooters of ten days before. The Celandine is over, but the Cuckoo-flower lingers on. By-the-bye, I sometimes fancy that I must be as regards scent, whatever is equivalent to being colour-blind. At least, I can't smell the perfume of dying Strawberry-leaves, which several friends whose veracity I cannot doubt describe as delightfully aromatic, and still less can I smell the perfume of the Cuckoo-flower: and yet Tennyson speaks of the "melancholy" of his Margaret as being

"Sweet and frail  
As perfume of the Cuckoo-flower."

In the garden the Irises are now the gayest things. The poor *Buddleia* stands in a large round bed, all Irises of the old large handsome blue variety, and nothing can look better than they do. It is curious

how seldom the Iris is mentioned by our English poets, and yet it is none other than the historic *Fleur de lis*. Milton, it is true, speaking of Adam's bower, mentions among the plants that grew there (the seasons of Paradise were not quite the same as ours)—

"Iris all hues, Roses, and Jessamine ;"

but I hardly remember any other familiar passage.

The Lily of the Valley is almost over. Certainly the poets have not neglected it, and we all know how in the Garden of the Sensitive Plant—as everywhere else—

"The light of its tremulous bells is seen  
Through their pavilions of tender green."

Before bringing to-day's note to a close, I must mention a little incident which has rather struck me. The other day, three men were seen rambling over our field, evidently in search of something. They turned out to be Frenchmen, who had come to the neighbouring town, as cabinet makers, and they were out for a country walk to look for some "Oseille" (the common field Sorrel), to cook with a *fricandeau*. It was the first and (unless my French friends come again) will probably be the last time that any one has thought of making use of this wild vegetable of my field. I wonder if Sorrel is much grown and used in England—and if not, why not? *H.* [It is to be found in most large establishments. EDS.]

## COLONIAL BOTANIC GARDENS.

(Extracts from Mr. Dyer's lecture, concluded from p. 683.)

SOUTH AFRICA.—Turning to the botanical establishments of South Africa, the most important of these would of course be looked for in Cape Town, the seat of the Government. The Botanic Garden there appears to have been established by Sir Harry Smith in 1848; the ground was given by the Government, with £300 a year, to be met by an equal sum to be raised by subscription. The rest of the expenditure was to be defrayed by the profits from the sale of plants. Sir William Hooker was consulted by the Secretary of State for the Colonies at the time, and Kew has always maintained an active correspondence with it. The present superintendent, Mr. McGibbon, was appointed in 1830, and his annual reports tell a continuous story of an arduous struggle with crippled means and incapacity from other difficulties to make the establishment worthy of its position. Mr. McGibbon seems to have had a very just idea of what might be expected of it in this respect. Thus in 1868 he remarks in his report: "These gardens, with the contiguous kindred institutions of library and museum, both of which are really in the botanical garden, being the only place for visitors to these shores, should at all times be in a state to elicit the commendation of men of science, as well as of the ordinary traveller and visitor." The effect upon a visitor to the colony who had seen other colonial gardens may be judged from a communication to the *Gardeners' Chronicle* in 1878, where it is described as "rather small, and poorly and unsystematically laid out." Its position in the centre of the town is unfortunate, and prejudicial to the purposes which it should fulfil. In 1873 Mr. McGibbon reports: "The propagation and cultivation of young fruit-trees in these gardens have never been attended with marked success, especially in stone fruits, the soil and situation being quite unsuited to their wants." Again: "Very few Conifers succeed in the close, dusty, stifling atmosphere of the parent garden, nor is there space for them here. In future years the whole colony would be supplied with seeds for planting from such as would be found to succeed best." Nor do the gardens appear to be better suited to the characteristic types of South African vegetation. In 1874 Mr. McGibbon reports: "Two of the most extensive Cape orders, Ericaceæ and Proteaceæ, which are always desiderata in other countries, cannot be kept alive in the atmosphere of the Cape Botanic Garden." The ground, already restricted, seems to have been diminished by space taken for the erection of public buildings, and which involved the loss of many valuable trees. It is of course difficult to decide for those who have to deal with such matters on the spot. But, as I have already suggested, there certainly seems to be something like a case for the removal of the Cape Botanic Garden into the country along the line of railway, and its reconstruction on a wider and more liberal basis. Even under present circumstances the garden seems to have secured a firm hold upon the colony.

In 1860 Mr. McGibbon writes: "At one time, only a few years since, such easily-produced things as Gum-trees, *Ilacæas*, could be procured only at the gardens. The Botanic Garden has not only pointed out the necessity and created a taste for planting, but has also called into existence a branch of industry [nurseries] not previously existing at the Cape." And in 1868 he states: "There is hardly a village or district in the Colony and in the Free State which does not avail itself of the garden to procure seeds and plants at a moderate price."

The financial affairs of the garden have always languished. The original Government grant of £300 a year was reduced in 1867 to £250, but raised again in 1872 to £500. In 1877 the radically unsound system of allowing the superintendent to farm the sale of plants and seeds was abolished, and an increase was made to his salary, which had always been too small, especially as he was not supplied with a house, in lieu of it. The result has so far been advantageous.

The gardens seem steadily to have kept in view the important function of bringing new industries into the Colony. Except where affected with prolonged droughts, the cultivation of all kinds of fruit trees suited to a temperate climate is of course of first-rate importance. Not less is the introduction of useful timber trees; and both these appear to have been steadily pursued. The germs of two important industries started in the Botanic Garden. In 1863 the best kinds of Olive plants were procured from Europe. The tree appears to flourish and fruit abundantly now in the western part of the Colony. The difficulty appears to be to find a market for the produce; yet, in Europe, I believe it is notorious that the supply of olive oil is largely supplemented by that of the ground-nut. In 1867 the Governor, Sir Philip Wodehouse, ordered the introduction from France of 3000 white Mulberry trees for rearing silkworms, and defrayed all the expenses personally. The following year 25,000 additional trees were imported by the Government. I do not know what progress since, if any, the business of silkworm rearing has made.

Mr. McGibbon, it is only just to mention, records in 1873 that "an active exchange of plants, seeds, &c., is kept up with kindred institutions abroad. In our lists of desiderata, preference is always given to economical subjects." He has, however, always been hampered by the difficulty of performing one of the most important functions of his office—that of travelling in the interior of the Colony for the purpose of collecting and so obtaining new seeds and plants and objects of natural history, especially dried plants, which would be acceptable by way of exchange to botanical institutions at home. As he states in 1868: "It is impossible for the superintendent of the gardens, with his present duties resting on his shoulders, to make frequent and extended journeys for collecting." For this reason also the herbarium, which was "in its infancy" in 1856, never seems to have emerged from the infantile stage; nor is there in the garden anything of the nature of a museum.

Botanic Gardens, all no doubt destined eventually to attain considerable importance, exist at Port Elizabeth, Graham's Town, Graaff Reinet, King Williamstown, and Queen's Town; with all except the last, which has apparently but lately come into existence, Kew has entered into correspondence, and it has assisted them in various ways. The legislation, of somewhat doubtful policy, which has recently prohibited the importation into the Cape Colony of living plants of any description, for fear of bringing with them the *Phylloxera*, will undoubtedly hinder its botanical enterprise, and practically puts a stop to any further correspondence with Kew, except in the shape of seeds. It is peculiarly unfortunate that the introduction of new kinds of fruit trees, for the cultivation of which South Africa is peculiarly suited, should now for the present be put an end to.

All these gardens should be affiliated in some degree to the metropolitan establishment at Cape Town. It is scarcely necessary for each of them to have a herbarium and an economic museum, or even any one with more qualifications than those of a good practical gardener to manage them. But it seems to me that at the seat of Government there should be an establishment—on a modest scale no doubt—but which should be the headquarters of all that relates to the botany of South Africa. I understand that the natural history museum and the library, with its important philological collections, are not unworthy

of so important a Colony. But considering how very remarkable a flora temperate South Africa possesses, it is not too much to hope that Cape Town will in time add to its other natural history collections a thoroughly good herbarium and a museum of local vegetable economic products. These should be placed in charge of a competent botanist, who would assist in keeping the nomenclature of the other botanic gardens up to an accurate standard, and who would have the assistance of Kew in all difficulties. Such an officer the Colony formerly possessed in Dr. Pappe, and I believe his herbarium was purchased at his death for the South African Museum. It would be needless to refer to the circumstances under which the tenure of office of his successor came to an end. But I think that now, as we all hope, a great future is in store for our South African colonies, it is time that the reconstitution of this important scientific department, in a way worthy of their metropolis, should be again considered; and it is a pleasure to say that there are abundance of able colonists in South Africa who would, I am convinced, be only too pleased to undertake the task.

The Botanic Garden in Natal, as perhaps might be expected, is in a somewhat dormant condition. It is said to be a common remark in the Colony that nothing good will grow there; but private gardens are said also to produce in profusion everything that is worth cultivating in the tropics. The Botanic Garden appears to have maintained an active exchange with India and Australia, and the last reports we received held out some promise of a successful beginning being made with Tea cultivation.

The Botanic Gardens of Mauritius, at Pamplemousses, owe their origin to the munificence of a wealthy French gentleman about a century ago, who gave the land to the Government. Its principal business of late years has been the introduction and distribution of new varieties of Sugar-cane. Of these a collection of about 130 kinds is now cultivated. There is also a temperate garden at the height of 2000 feet in the centre of the island; here *Cinchona* (from Ceylon seed) and Tea do well. Mr. Horne, the director, who is now in this country, has lately made an extensive tour in the southern hemisphere as far as Fiji, where his advice has, as I have pointed out, been of great service to the Government. He utilised his travels in increasing the Mauritius collection of Sugar-canes, which must now be the most extensive in the world. To Mr. Horne we are under great obligations for his assistance in sending collections to Kew for the preparation of Mr. Baker's Mauritian *Flora*.

In the Seychelles, botanical interests are cared for by the Chief Commissioner. We have supplied him with Liberian Coffee, and are preparing to forward the Cola-nut and other plants.

And here I must not forget to mention Dr. Kirk, Her Majesty's Political Agent at Zanzibar, who is indefatigable in the midst of arduous official work in procuring for us botanical novelties of every kind. To his energies are largely to be attributed the development of the trade in East African caoutchouc, of which, through his aid, we now have two kinds in cultivation at Kew. With our settlements on the West Coast of the continent we have also occasional correspondence, and from Cape Coast we obtained in 1872, and grew at Kew for the first time in Europe, the celebrated Liberian Coffee, since distributed to so many parts of the world. It is much to be wished that at some point in Western tropical Africa a botanical station could be established.

#### NOTES FROM CHATSWORTH.

Outdoor vegetation at Chatsworth has not suffered through the effects of the exceptionally low temperature of the past winter nearly so much as in the winter of 1860-61, when so many trees and shrubs succumbed. This may be accounted for by the autumn of last year being much drier for a considerable period previous to the frost setting in, and thus preparing most things better to withstand extreme cold than they were nineteen years ago, when warm moist weather almost like spring continued up to within a few days of the frost commencing. In addition to this, after the experience of the 1860-61 winter, the wise precaution was taken not to again plant such species of coniferous trees as were then destroyed, a course which, if followed generally, would not have resulted in the many vacant places

from whence the dead have been removed, or the still more unsightly presence of the quantities of half-killed specimens that are now to be met with in some parts of the kingdom. Nevertheless, the frost has left its mark, if to a limited extent, notably in the destruction of the fine old *Wistaria* on the wall immediately above the long glass corridor leading from the mansion up to the Orchid-houses. This plant occupied some 65 yards in length of wall from point to point of its branches; its stem a little above the ground was 5 feet in circumference. The grounds as a whole show little trace of the unusually severe frost; the rockwork in most cases is now all but covered with trailing shrubs, that look as fresh and green as if the winter had been mild.

The conservatory, which probably more people from all parts of the world have visited than any other structure of a similar kind in a private establishment, has during the last year or two undergone a regular course of renovation. The plants in it look in the best of health, the permanent occupants comprising Palms, Musas, Tree Ferns, Cycads, and a host of kindred subjects continue to flourish as they have always done. One of the most effective and useful plants here is *Bougainvillea glabra*, grown in numbers, trained in the shape of straight columns up to the roof on the inside of the path on the south side of the house; when in flower its innumerable mauve bracts must have a charming effect. *B. spectabilis* is also similarly grown in company with it. In the extensive collection of Epiphyllums which occupy the stage on the south side of the house, some beautiful large-bloomed kinds were in flower. The roasting they get here near the glass is just in accordance with their requirements. The fine Chinese Orchid, *Renanthera coccinea*, which so few people succeed in flowering, seems to be nearly always in bloom here; a strong large plant was bearing a couple of immense spikes, the largest of which, with four branches, was near upon a yard across. Few flowers last so long, and its colour, bright red, is scarce amongst Orchids.

In the Orchid-houses the plants look well; hung up near the roof I noticed a number of examples of *Dendrobium Bensoniae* in small shallow pans that had made very strong growth. Some of the bulbs were bearing as many as twenty-eight flowers each. The old but most useful of Orchids, *D. nobile*, is grown in quantities to bloom in succession. *Calanthe veratrifolia* and *C. Dominiana*, both excellent subjects for lasting either on the plant or when cut, were blooming well. A plant of *Odontoglossum vexillarium*, grown from a single break in four years, had on it sixty-one flowers. A single growth of *Aerides Fieldingii*, with twenty-six healthy leaves, was bearing a three-branched spike 2 feet in length. The stronger growing *Vanda*, such as those of the *V. suavis* and *V. tricolor* sections, grow like weeds; they almost fill the centre portion of a good sized house; one specimen of *V. suavis* is near upon 8 feet high by 6 feet through, clothed with healthy foliage, and there are numbers only something smaller. Kinds like *Cœlogyne cristata*, *Calanthe Veitchii*, *C. vestita*, *Pleiones*, and other winter flowering sorts, are grown in quantity. *Cattleyas* and *Lælias* are in a house by themselves, and apparently doing very well. Some fine varieties of *Cattleya Trianae* and *C. Mendelii* were in bloom. A nice collection of cool species, comprising *Odontoglossums* and *Masdevallias*, are coming on. A number of strong plants of the Cape Disas is located in one end of a house filled with Cape Heaths, which include most of the best hard-wooded varieties in good healthy condition, showing unmistakably the treatment they receive, and at the same time indicating what the Disas like.

In the Camellia-house the plants have grown to a very large size, and are in fine order. *Lapagerias* are grown along with them, and also the beautiful but seldom seen *Luclia gratissima*. The long glass corridor affords facilities for growing a number of plants that require room to spread to an extent they do not get under ordinary conditions, and here there is always something interesting. When I saw them in the early part of May, *Rhododendron Edgworthii* and a *Brugmansia*, each covering a large space, were clothed with a complete sheet of flower, such as not possible when grown where their head-room is restricted. With them were the two enormous specimens of *Camellia reticulata*, each covering a space some 30 feet high, and bearing hundreds of their immense flowers, resting on a background of deep green healthy leaves.

*Ixoras* are grown in quantity for cutting, especially the old and still the best, *I. coccinea*. A house is devoted to these plants, and remarkably well they look, with long stout healthy young shoots that have already in many cases reached a length of 2 feet. They comprise, in addition to *I. coccinea*, the best of the hybrid varieties, such as *I. Williamsii*, *I. Colei*, and a number of seedlings.

In the Victoria-house this year's specimen of the big Lily recently planted is just beginning to grow away; the rapidity with which this plant gains strength and size when once it gets established is in keeping with its extraordinary habit generally. The immense specimens of *Achimenes* grown in wire baskets suspended from the roof of this and the Palm-house, and which yearly are such a feature at Chatsworth, are making progress, and will doubtless, as heretofore, produce an effect which few, if any, other plants used for a like purpose are capable of. The *Amberstia nobilis* is fast attaining the proportions of a tree, and threatens at no distant time to outgrow the house in which it is planted.

Those who have been in the habit of visiting Chatsworth during the spring for some years will have noticed that Mr. Speed depends largely upon pot Vines for early Grapes, which are very well done. This year is no exception. The two large houses thus occupied have in them an immense number of these pot plants bearing a uniform heavy crop of well-finished fruit—the earliest house about ripe; the sorts grown are principally Black Hamburg and Foster's Seedling; the second house was just beginning to colour. This year the house occupied with permanent Vines, and started the same time as the first of the pot-plants, has distanced the latter for time, as the crop was mostly cut before the pot-fruit was ripe. The remains hanging in this earliest house were beautiful examples of early Grape growing, both as to size and general finish.

The house of old Hamburgs—now, I understand, some forty years planted—contains an excellent crop fast coming on. The long range of vineries, in six divisions, planted by Mr. Speed, and now in full bearing condition, from present appearances all promise to produce an excellent crop, as also do the latest houses, four in number, let to start of their own accord, and which, from the abundance of fruit showing, evidently had their wood fully matured last autumn, notwithstanding the adverse summer and not over-favourable locality for the indispensable ripening process.

In the first Peach-house Early Beatrice was just about ripe; the other kinds associated with it are mostly old well-proved kinds. In the succeeding house, occupied by Elruge Nectarines, Royal George Peach, and Hale's Early Peach, the last-named excellent variety was quite a month before the former kind. Peaches will not succeed on open walls at Chatsworth, but a very large extent of glass is occupied with this fruit. The trees in the successional houses, as in those already described, are in good bearing order and carrying heavy crops in various stages. What still remains of the two once immense old trees, Royal George and Admirable, in the large house, which, as many who visited the place in years past will remember, had grown to a size and covered a space as gave them a celebrity unequalled in the cultivation of this fruit, are at last fast going the way that the trees of this comparatively shortlived species does; branch after branch has gone, but still the portions that remain have set thousands of fruit. As the trees have gradually become smaller young ones have been planted to fill up the space vacant. The Fig-house here is a very wide structure; the plants are trained on an almost flat trellis. A splendid crop was coming on.

Strawberries in successional stages of growth were equally well done, and in quantities corresponding to other forced fruits, occupied shelves overhead in the various forcing-houses, and from the heavy crop of large handsome fruit they were carrying, have clearly done better here than in many places after the very indifferent season the last was for maturing the plants. The Cape Gooseberry is evidently a favourite, a spacious span-roofed house being devoted to it, where it is kept going so as to furnish a supply of fruit nearly the whole year round.

The variety of the Madagascar Lattice-plant, known as *Ouvirandra Berneriana*, is considered here a more satisfactory plant to grow than *O. fenestralis*, particularly when confined to a limited space; it was growing in one of the forcing houses in an ordinary

wooden tub not more than 3 feet diameter. Nothing could possibly be doing better, as proved by the quantity of clean healthy leaves it bore, some of them quite 15 inches long. The nature of the water in which this most singular plant is grown has evidently something to do with its well-doing; in some places its leaves keep clean and free from the conferva-like sediment, whilst in others, under exactly similar treatment, they become coated with slime to an extent that not only renders them unsightly to look upon, but destroys the foliage prematurely, through which the plant gradually becomes enfeebled.

The effects of the last sunless wet summer upon hardy fruits, so apparent in many parts of the kingdom, are more visible at Chatsworth than in most places, as with few exceptions the trees have very little bloom upon them. The situation is such as to make the cultivation of outdoor fruits precarious, even when the wood has been fully ripened—a condition in which it was very deficient last autumn. *T. Baines.*

### GREENHOUSE PLANTS FOR WINTER AND SPRING DECORATION.

*Correas*, and more particularly *C. cardinalis*, are an exceedingly useful class of plants, the one specified being most brilliant in colour and affording a continuous succession of flowers the whole of the winter. These being tube-shaped, and hanging from the slight twiggy shoots, have a graceful appearance, and the only drawback the plant has is its somewhat curled and very sparse leaves, but so beautiful are the blooms that this defect is hardly noticed when backed up by others having more foliage. The best way of managing it after it has done flowering is to keep it in a house where it can have a little artificial warmth, moisture, and slight shade, such as is required for Fuchsias or other similar plants when making their growth; and to improve the shape and render it of a more bushy habit, the points of the young shoots should be nipped out after they have got 6 or 8 inches long, which will induce them to break again, and thus keep it well furnished below. The growth complete, a half shady place outdoors during August and September will suit it best, but like all hard-wooded fine-rooted subjects, it is important that the pots be protected, or the fine fibrous portions that touch the sides are apt to perish through being dried on the sunny side or from parching winds acting on the exposed surface, the desiccating effect of which is so great that it is very injurious.

*Heaths* of the free flowering class, such as *hymalis*, *Wilmoreaana*, and *gracilis*, are quite indispensable for winter blooming, and so easy to manage that any one having a slight knowledge of plant culture is able to grow them. The best way with these is to buy them towards the autumn when they have got to a serviceable flowering size, and after their beauty is over then to cut them back and keep them in any warm house or pit where they can have an occasional syringing to encourage fresh growth; on which they will bloom the year after.

*Salvias* are perhaps the best and most showy among soft-wooded plants that come in during the winter, and when well grown and flowered make a grand display owing to the exceeding brilliancy of their blossoms, the bright glowing scarlet of which quite lights up any house they may be placed in. The three most useful species are *S. splendens*, *S. Heeri* and *S. gesnerifolia* that flower in the order in which they are named, the first commencing early in the autumn, and lasting till Christmas, the two others following immediately on in succession and continuing in full beauty till April. The proper way to manage them, unless very large plants are desired, is to propagate fresh stock annually about February, and grow them on outdoors in a fully exposed situation where they can be plunged in some non-conducting material, such as half-decomposed leaves, so as to shade the pots and prevent the soil in which the plants are grown from drying too rapidly, as it otherwise would. A hard coal-ash bottom to stand them on, or a small piece of slate placed under each, will prevent the ingress of worms, and any stopping they require to keep them bushy should not be done later than the middle of August, or they will not have time to form strong shoots that will develop fine spikes of bloom. The most suitable soil to grow them in is a stiffish fibry loam, enriched with a little mild, thoroughly decom-

posed manure, in which mixture they will thrive in the most satisfactory manner possible.

*Libonias*, such as *floribunda* and *penrhosiensis* ×, should be largely grown wherever free-flowering plants are required, as they are not only exceedingly showy, but they last in perfection a great length of time, and are so neat and compact in their habit as to occupy very little room. *Libonia penrhosiensis* is a hybrid, the result of a cross between *L. floribunda* and the well-known *Sericographis Ghiesbreghtiana*, so useful as a winter-blooming plant. In general character and appearance it is intermediate between the two, and partakes in every respect of the good qualities of both, so that altogether it is a most valuable and desirable thing to have where a display has to be kept up during the dull season of the year. Although under certain conditions the habit of *L. floribunda* is, as its specific name implies, a very free blooming plant, many fail with it through not getting the young growth on which the flowers are formed thoroughly ripe and mature, which can only be done by exposing the plants to full sun and air towards the autumn by withdrawing the lights during the day and closing them again in the evening after being syringed. Managed in this way they make short stubby growth, that is so floriferous that any one cannot fail to be pleased with them; and on such plants it is very rare that any of the leaves fall in the way they sometimes do when the stems are sappy and green. Dryness at the root, or any sudden transition of temperature, will likewise aid in bringing about this shedding of foliage, and therefore changes of this kind should be avoided as much as possible. Any one having old plants of either of these useful *Libonias* should cut them well back at once, and thin out the branches a little so as to leave room for the young growth that will follow to take their place. The kind of soil best adapted to grow them in is a mixture of loam and leaf-mould in the proportion of three-parts of the former to one of the latter, both of which should be well incorporated, and the plants, after being partly shaken out, potted somewhat firmly. Cuttings struck at once and pushed on quickly will make nice useful stuff by the autumn, and come in well for growing on as specimens for the following year.

*Richardia ethiopica* is a grand decorative subject for embellishing greenhouses and conservatories during the winter and early spring, a time when its pure lily-like flowers are doubly acceptable. To get it in, however, at these seasons it is necessary to afford the plants a little warmth just to give them a start, after which they will continue to send up their blooms in succession. The best and easiest way to manage this useful *Richardia* is to carefully divide it any time in spring and plant out during May or early June in well enriched shallow trenches similar to those generally prepared for Celery, only not so deep, and every few days during dry weather to soak them well with water, of which, sunk below the level as the crowns of the plants will then be, they will get the full benefit. It should be borne in mind by all who grow them that they are semi-aquatic, and cannot, therefore, be kept too moist all through the summer months, as then it is that the flowers are formed, and any check is sure to limit the number of these very materially. Plants kept in pots are generally starved, and this is why it is that they are so rarely seen in really first-class condition, with the strength and vigour they have when planted out and well cared for. Although *Richardias* are hardy if kept with their crowns under water, a very little frost disfigures the foliage, and this being the case, it is necessary to take them up towards the end of October, that they may be potted and got under cover.

*Cyclamens*.—A greenhouse without these during the winter would lack one of its principal charms, so varied and beautiful are they in their rich glowing colours. To have these really fine and keep up a stock of healthy free-flowering bulbs seed should be sown annually, and fresh plants raised to replace such as become old and exhausted, as they become in the space of a few years. In the management of these the best way is to turn them out of their pots after they have done flowering, and to plant them in a bed of prepared peat or leaf-soil in some half shady spot where they can be sprinkled overhead every afternoon during dry sunny weather, so as to encourage plenty of healthy foliage, without which they never produce flowers in the free manner they are capable

of. The old plan of growing *Cyclamens* and drying them off immediately they had done blooming caused much loss of vital power in the bulbs, but since a different kind of treatment has been pursued astonishing results have followed, as the plants one sees now will abundantly testify. When not planted out, the next best way of managing them is to keep them in a shady pit or frame, where they can be well syringed and have the lights placed on by night, so as to maintain a warm, humid atmosphere—a condition highly favourable to their welfare, especially as regards young plants raised from seed during the present season, and which have to be helped on in their growth. In the case of such as are planted out it is important that they be lifted early in the autumn and potted, that they may have time to make fresh roots and become thoroughly established before winter sets in. The assistance of a close, warm frame for a week or so will greatly aid them in this, after which the most suitable place for them is a light shelf near the glass in a greenhouse, where they can be afforded a temperature ranging between 40° and 50°.

*Primulas* of the Chinese section are likewise indispensable, and fine plants of these may be grown in any ordinary garden frame; indeed, so suitable is this to their requirements that they succeed better there than anywhere else. What is needed is a firm bottom of ashes to stand them on, and such natural shade near as is afforded by a tree or building, so as to obviate the necessity of using mats or anything of that kind on the glass to keep out the sun, for they not only do this, but they obstruct the light likewise, and this causes the plants to become etiolated and weak, instead of being sturdy and strong, with thick stout leaves and stems, such as they have when the conditions are favourable. In order to preserve a moist atmosphere around them the floor of ashes on which they stand should be kept well damped down, which may be done by sprinkling the plants overhead before closing them for the night, but this ought only to be carried out when the external air is dry and renders such a course necessary.

*Cinerarias*, too, that are now so popular owing to the great improvement made in the size and form of the flowers, should be treated in like manner, as no place suits them so well as where they can get natural shade and a cool moist bottom to stand on, in which position, kept duly watered, they are rarely assailed by red-spider, a pest that otherwise is often most troublesome.

*Solanums* of the berried sections, such as *Wetherell's Hybrid*, should not be omitted, as they are of great decorative value when properly managed, but many fail to get them well fruited through not planting them out in an open, sunny position, or from not keeping them uniformly moist at the roots. In pots it is most difficult to do this, and therefore the blooms tumble off instead of setting as they would do if the plants had plenty of soil to feed on. Before planting them out, however, the heads should be pruned hard in, as all the bloom and berries they form come on the young growth made during the summer, besides which, the pruning is necessary to keep them close and compact. *J. S.*

### NEW MEDICINAL PLANTS.

THE rate at which new drugs are introduced to British commerce now-a-days is somewhat surprising, and it is a notable fact that most of these new introductions are of vegetable origin. Many of them no doubt are destined to be heard of once and then forgotten, but on the other hand there are some that seem of real value and are being taken up enthusiastically by the medical profession, and further are being or have been carefully examined and experimented upon in our large London hospitals. This application of plants to the cure of diseases of the human frame is one of the highest to be sought for, and we must all hail with satisfaction any addition to the list of efficient drugs. Not long since we referred to the introduction of a new substance under the name of *Quebracho*. Two kinds of *Quebracho* are now known in English commerce, namely, the white, *Quebracho blanco* (*Aspidosperma Quebracho*), and the red, *Quebracho colorado* (*Loxopterygium Lorentzii*). The first of these is an Apocynaceous tree growing abundantly in the province of Santiago, and the bark has been used for many years as a febrifuge in South America, instead of Cinchona; latterly, however, it has assumed a prominent position in this country, and is in great

demand as a remedy in dyspnoea. The bark has been found upon examination to contain a crystallisable alkaloid called aspidodermine. The wood of this plant, together with that of the red Quebracho, is used in tanning on account of its astringency.

Under the name of Dito Bark, that of *Alstonia scholaris* has latterly attracted some attention. This tree is widely diffused in India and the Moluccas. The wood is extremely light, and is said to be used in Ceylon for making coffins. The bark is intensely bitter, and is well-known in India for its medicinal properties, being used as a tonic in dysentery, diarrhoea, and similar complaints. A substance contained in this bark, which was at first mistaken for an alkaloid principle and named ditaine, has since been found to be "a substance of a complex nature containing a definite principle, ditamine, which acts on the animal economy like curare, and which it would be very dangerous to use as quinine."

Another species of *Alstonia* (*A. constricta*), a tree widely distributed in Australia, produces a bark which as it appears in commerce is thick, of an ash-grey colour on the outside and of a brightish yellow inside. This bark has been introduced for the cure of malarial disorders.

Perhaps one of the most remarkable introductions, however, of late years is a new remedy for neuralgia, which has latterly attracted much attention in consequence of the difficulty there has been in discovering the botanical source of the ingredient used. This new medicine is known by the name of Tonga, and has been brought into this country from the Fiji islands. As seen in the London market, it consists of a mixture of broken pieces of bark, leaves, and woody fibre; into such small fragments indeed is the whole composition broken up that it is very difficult to detect any special characters by which its botanical origin might be traced. These broken pieces of bark, &c., are loosely tied up in bundles about the size of a small Orange, the wrapper being a portion of the sheathing base of the leaves of the Cocoa-nut Palm.

In a paper on the "Composition of Tonga," read at a recent meeting of the Pharmaceutical Society by Mr. A. W. Gerrard, the author says the drug was brought to Professor Sydney Ringer by a gentleman residing in Fiji, with the following account:—It has been used several years by the aborigines of the Fiji islands, and a European, who married a chief's daughter, learnt the secret from his father-in-law, in whose family the knowledge of the composition of this remedy had been an heirloom for upwards of 200 years. The name Tonga seems to have been given to the drug without any meaning, and simply for want of something more definite. For use, the rough native bundle, with the cocoa-nut fibre still attached, and without being unfastened, is recommended to be steeped in half a tumbler of cold water for ten minutes; the bag or bundle is then to be squeezed into the tumbler, and the infusion so prepared taken in doses of a claret glassful three times a-day about half an hour before a meal. After so using, the bundle or bag is to be hung up in a dry place to prevent it getting mouldy, and it is ready for use at any time, the same bag answering the same purpose for a year or more. A persistent use of the Tonga infusion thus prepared is said to be a certain cure for neuralgia; indeed, it is stated as a fact that a cure has been effected on the second or third day. The drug has been recently sent out by an eminent firm of London chemists both in the form of the native bags, and prepared as a tincture or infusion. The reports by medical men on the efficacy of this new drug, combined with the novel form in which it has appeared, and the difficulty of discovering its origin, owing to the small fragments into which it is broken, which appears to be done purposely to prevent its discovery, all tend to make this remedy one of considerable interest. It is not improbable that the composition includes parts of more than one plant. Mr. E. M. Holmes, of the Pharmaceutical Society, who has carefully examined the substance, thinks that the stem of a species of *Rhaphidophora*, probably *Rhaphidophora vitiensis*, Seem., plays an important part in the mixture. Judging from the trials that Tonga has had, it seems not unlikely that it may play an important part in the druggist's repertory.

The American people are much more fertile in their imagination as to the properties of plants likely to prove advantageous for medicinal or economic purposes than we are, therefore it is not surprising that America should send us many novelties in this line, which are indeed being constantly added to. *J. R. J.*

## PLANT PORTRAITS.

*ACANTHORIHA ACULEATA*, *Illustr. Hort.*, t. 367.—A noble Mexican Palm, the trunk of which is covered with a network of branching spines; petioles slender, leaves orbicular, palmately slit into numerous linear-lanceolate, glabrous segments, deep green above, silvery beneath. A greenhouse Palm, introduced by M. Linden.

*AMARYLLIS MRS. BAKER*, *Florist*, t. 509.—A splendid variety, with very large well-shaped flowers of a blood-red or crimson colour, of good substance. Raised by Mr. Baker. Messrs. Veitch & Sons.

*AZALEA INDICA*, MADAME L. VAN HOUTTE, *Flore des Serres*, t. 2383.—Salmon-pink edged with white.

*BARKERIA ELEGANS*, *Floral Mag.*, t. 394.—A representation of the plant shown under the erroneous name of *B. cyclotella*. See *Gard. Chron.*, Jan. 17. Mr. Bull.

*BEGONIA BRILLIANT*, *Floral Mag.*, t. 393.—A compact-growing variety, with pendulous flower-stalks and brilliant scarlet flowers of moderate size. It is well adapted for pot culture. Mr. B. S. Williams.

*BEGONIAS*, tuberous varieties, *Flore des Serres*, t. 2390.—Six fine varieties.

*BERTOLONIA HRUBYANA* ×, *Flore des Serres*, t. 2381.—A superb hybrid, the leaves of which have a ground colour of dark green spotted with small white spots, the nerves and secondary veins green edged with white. Van Houtte.

*BERTOLONIA RODECKIANA* ×, *Flore des Serres*, t. 2382.—In this variety the ground colour is bronze speckled with white spots, the nerves fine green edged with creamy white. Van Houtte.

*BOWENIA SPECTABILIS* VAR. *SERRULATA*, *Illustr. Hort.*, t. 366.—Segments of leaves obliquely ovate, tapering to both ends, dentate.

*CHEVALLIERIA VEITCHII*, *Illustr. Hort.*, t. 362; also known as *Æchmea Veitchii* (see *Bot. Mag.*, t. 6329).—A Bromeliad of tufted habit, producing dense spikes of brilliant red bracts; flowers whitish. New Grenada.

*CÆLOGYNE LAGENARIA*, *Flore des Serres*, t. 2386.—The *Pleione lagenaria* of *Bot. Mag.*, t. 5370.

*COLCHICUM SPECIOSUM*, *Flore des Serres*, t. 2385.—See *Bot. Mag.*, t. 6078.

*CONANDRON RAMONDIODES*, Sieb. et Zucc., *Bot. Mag.*, t. 6484.—A very remarkable Japanese Gesnerad, described in *Gard. Chron.* 1879, p. 232.

*CRINUM PODOPHYLLUM*, Linn., *Bot. Mag.*, t. 6483.—A dwarf species with wavy leaves, tapering at the base into a long stalk; scape lateral, erect, bearing a small number (two) of sessile flowers, each about 8 to 9 inches long, with a slender curved tube and funnel-shaped six-parted limb segments, lanceolate, white. Old Calabar; stove bulb.

*CROTON BARONESS DE ROTHSCHILD*, *Illustr. Hort.*, t. 365.—A seedling from *C. Veitchii* as seed parent, and *C. maximus* as pollen parent. A vigorous variety with oblong-obovate shortly-stalked leaves, the ground colour of which is green or purplish, the nerves being picked out with shades of carmine-rose and yellow.

*CYCAS MEDIA*, R. Br., *Illustr. Hort.*, t. 368.—This noble species has been introduced to the gardens at Monte Carlo, near Monaco, by M. André.

*CYPRIPEDIUM LAWRENCEANUM*, Rehb. f., *Flore des Serres*, t. 2372.—See *Gard. Chron.* 1878, Dec. 14, p. 748.

*DENDROBIUM LOWII*, *Flore des Serres*, t. 2395.—See *Bot. Mag.*, t. 5303.

*DRACÆNA (CORDYLINA) PRINCESS MARGARET*, *Flore des Serres*, t. 2375-76.—A variety introduced direct from the South Sea Islands by Mr. Peter Veitch.

*DRACÆNA REGIA*, *Illustr. Hort.*, t. 360.—A seedling between *D. Mooreana* as pollen parent, and *D. regina* as seed parent. The leaves are broadly ovate-lanceolate, stalked; petiole and midrib cherry-red, limb of leaves rosy-purple with paler edges. A very beautiful variety, raised by MM. Chantier, of Montefontaine.

*DROSEREA LINEATA*, *Illustr. Hort.*, t. 361.—Leaves long-stalked, blades divided pedately into linear segments studded with stalked glands. Australia and New Zealand.

*ERYTHRINA (?) MARMORATA*, *Flore des Serres*, t. 2379.—A beautiful yellow variegated plant, in which the green colouring matter of the leaves is

broken up into squarish masses of varying shades of green dispersed over a yellow groundwork.

*FUCHSIA LYE'S FAVOURITE*, *Floral Mag.*, t. 396.—Habit good, flowers long, well formed, white tube, reflexed sepals, rosy-crimson petals. An excellent variety for decorative purposes.

GOOSEBERRIES, *Florist*, t. 511.—1, Telegraph; 2, London; 3, Snowdrop; 4, Fascination.

*GUSTAVIA INSIGNIS*, Hook., *Flore des Serres*, t. 2392.—See *Bot. Mag.*, t. 5069.

*HÆMANTHUS KALBREYERI*, *Flore des Serres*, t. 2377-78.—See *Gard. Chron.* 1878, August 17, p. 202.

*IMANTOPHYLLUM (IMANTOPHYLLUM) MINIATUM* VAR. *MARIE REINIERS*, *Flore des Serres*, t. 2373-74.—A fine variety, raised by Mr. T. Reiners, of Ottensen, near Hamburg.

*HYPERICUM ÆGYPTIACUM*, Linn., *Bot. Mag.*, t. 6481.—A low growing shrub with minute leaves, and small yellow flowers. Flowers in late autumn; half-hardy.

*MASDEVALLIA INFRACTA*, Lindley, *Flore des Serres*, t. 2389; *Gard. Chron.* 1871, p. 1422.

*MASDEVALLIA TOVARENSIS*, Rehb. f., *Illustr. Hort.*, t. 363.—A charming white-flowered species, figured in the *Bot. Mag.*, t. 5505, and in *Gard. Chron.* 1874, p. 715.

PEACH EARLY SILVER, *Florist*, t. 510.—A handsome freestone Peach, with the brisk taste of the white Nectarine combined with the "noyau" of the Peach.

PELARGONIUMS (Show), *Florist*, t. 511.—The varieties figured are:—1, The Pope; 2, Alice; 3, Emperor William: all very fine sorts.

*PITCAIRNIA ANDREANA*, Lind., *Bot. Mag.*, t. 6480.—Dwarf habit, leaves broad, entire, mealy; flowers in close racemes, scarlet, paling off into pure yellow. New Grenada. Kew; stove.

POMPON DAHLIAS, *Floral Mag.*, t. 395.—1, Karl Goldenberg, yellow tipped with white; 2, Little Bobby, rich magenta; 3, Pure Love, soft lilac.

*RHODODENDRON COMTE MICHEL CORINALDI*, *Flore des Serres*, t. 2387-88.—A dark flowered full-trussed variety, richly spotted with brown.

ROSE LA REINE, *Journal des Roses*, March, 1880.—A fine H.P. Rose, with large well-shaped flowers of a fine lilac-rose.

ROSE, TEA, MIDDLE, *MARIE VAN HOUTTE*, *Journal des Roses*.—Raised by M. Claude Ducher. A cross between Madame Falcot and Madame de Tartas; petals yellowish-white shaded with bright rose. A lovely Rose.

RURUS PHÆNICOLASII, Maxim., *Bot. Mag.*, t. 6479.—A Japanese Bramble with inconspicuous flowers and scarlet berries. Kew; cool greenhouse.

*STRELITZIA REGINÆ* VAR. *LEMOINIERI*, *Flore des Serres*, t. 2370-71.—A yellow-flowered variety of this gorgeous plant, said to have originated from seed, in the possession of M. Lemoinei of Lille. The plant is unique, but we cannot say it is any improvement on the original, rather the reverse.

*TRICHINIUM MANGLESII*, *Flore des Serres*, t. 2396.—See *Bot. Mag.*, t. 5448.

*WAHLENBERGIA TENUIFOLIA*, *Bot. Mag.*, t. 6482.—A very peculiar Campanula-like plant, with tufts of linear grassy ciliolate leaves, from the axils of which proceed slender decumbent flower-stalks with close heads of purplish flowers intermixed with leafy bracts broad at the base, and prolonged into a long acumens; also called *Edraianthus*. Southern Austria. Kew; hardy.

*YUCCA GLORIOSA* VAR. *MEDIO-STRIATA*, *Flore des Serres*, t. 2393-94.—A rare variety with the leaves variegated, with a central paler stripe. Van Houtte.

## Forestry.

OF all the various kinds and forms of disease to which forest trees are liable, none are so general or so fatal as those affecting their roots. In many, perhaps most cases, it is extremely difficult to say precisely wherein disease originates and how it is produced; and it is only when we see it in some of its intense forms of development that we are aware of its existence. As when we see a running stream we are aware that it is connected with a source, although that source may be far distant from us, so in like manner, when we see external evidences of disease we know it had its origin somewhere, but the precise source may be distant, obscure, and difficult to discover. We shall not attempt to define disease, but simply assume that the tree so affected is in an abnormal condition, and the

condition such as to result in frustrating the object in view by the grower of the tree. If a tree is planted with the object of growing sixty years, and attaining 30 cubic feet of timber, and any circumstance of interruption of growth arises to frustrate that object by terminating its existence at forty years and arresting its development at 10 feet, that circumstance of frustration and arrestment we shall, for convenience, term disease, and speak of it as such.

In order to the existence and presence of disease there must be the roots themselves, and there must also be the ingredients or agency that injuriously affect them. Plants, unlike animals, take what is bad as well as what is good for them. The ox or the ass in the field only eats such herbs as he relishes and are good for him, but the root of the plant is otherwise endowed, and therefore absorbs alike what is and what is not good for it; and, more than that, before the discovery can be made that the plant has

the other hand, the stomach is diseased, no part of the subject can possibly be well for a single day. What the stomach is to the animal the roots in an important sense are to the tree; in both they constitute the entrance-gate through which the food is admitted both in kind and quantity.

From these considerations the following inferences may be drawn, viz.—1. That the temperature of the soil should be always such that the plant delights in at all seasons, not too cold, too hot, or unduly variable. 2. That the soil should be sufficiently free and open to admit of the requisite amount of air entering it, and that light and moisture be also freely and properly admitted to it. 3. That the requisite food for the tree, whatever that may be, should be within reach of the fibres, so that at all times they can avail themselves of what they require; and these conditions apply not only to the newly-planted or young trees, but to the condition of trees of all ages and

growth of trees than paring and removing the surface turf, thereby allowing the roots to enjoy the elements from which they were excluded. *C. Y. Michie, Cullen House, Banff, May 31.*

### Florists' Flowers.

**GREENHOUSE FLORISTS' FLOWERS.—AZALEAS.**—The plants that flowered early in the season may still be subjected to a high temperature, the object being to promote a strong and vigorous development of the young wood. The leaves should be thoroughly syringed twice daily—in the morning before opening the ventilators, and at night at the time of shutting up. Other plants as they go out of flower should have the seed-pods removed, and be treated in the same manner. The main collection that has not been subjected to a higher temperature than that of the greenhouse will now be in flower, and serve to make a most bril-

FIG. 122.—CHYSIS CHELSONI. (SEE P. 722.)

absorbed food, or rather poison, that has injured it, the disease is too far established to be curable, even were the means and the knowledge of doing so at command. Diseased roots emphatically imply diseased branches, and indeed a diseased tree in every part; and it is probably by this circuitous operation that fatal results are so often produced. The roots affect the stem, branches, and leaves, and the leaves when diseased imperfectly elaborate the sap which should descend to nourish the roots; therefore it is that when one member suffers all suffer with it. To maintain and preserve a tree in perfect health and soundness we must not only see to it, that the roots are in every way healthy, but that they are in the most favoured condition to remain healthy to the time at which the whole structure of the tree attains its highest possible state of perfection. The cure of root diseases, like that of all others, is very precarious and difficult, and therefore all preventive means should be diligently and thoughtfully used. If the stomach of the animal is truly healthy it is scarcely possible it can be ill; but if, on

dimensions. 4. That the general state of health of the tree should be always such that it can absorb moisture and assimilate its food, for it matters little how much food there is within reach of the roots if they have not the power and capacity of receiving it. In point of fact, the tree must, in order to full health, have that requisite capacity known in animal life as appetite. The structure of the roots and their sensibility is much more delicate and acute than is commonly thought of. So much is this the case, that when a tree of considerable size is transplanted from a clayey or strong loamy soil to one of any other extreme, the roots may frequently decay altogether; and before they can recover, or the tree can make new roots, a small young plant taken from the nursery will have become a large tree. As another proof of the delicacy and sensitiveness of tree roots we have only to witness those situated near the surface of the ground, and compare their favourable growth with those situated deep in the ground; even on bare ground trees generally grow better than on rich and deep soils, and in many cases nothing contributes more to the successful

liant display. It ought to be stated that, although the plants make the best growth in a warm house, they will continue in good health, and flower well every year, even if they are not placed outside the greenhouse at all, except out-of-doors for six weeks or so in August and September.

#### AMARYLLIS.

During the last thirteen weeks or more these showy flowers have been a distinct feature in our greenhouse. We place them in batches in a house with a moist atmosphere, and a temperature of from 50° to 55° at night; the first lot is placed on shelves near the glass in January; the first flowers open in March, the latest will not be over until the middle of this month. After the flowering period is over the plants are again placed in heat until the leaves begin to turn yellow, when water is gradually withheld, but not altogether until November, when they receive none until they are started into growth next season.

#### BOUVARDIAS.

If these are to flower satisfactorily in the late

autumn months they must now have careful attention. Our plants up to this time have been in a house where they have had a little heat; they have now been taken out and placed in cold frames, the glass-lights kept rather close at first, but gradually, as the season advances and the nights are warmer, we remove them night and day. I do not care to use very large pots, those about 4½ inches in diameter are large enough for the plants raised from cuttings this year; we use 6 and 7-inch pots for the larger cut-down plants. See that the leaves are kept free from insect pests, the shoots trained into shape with the use of slender sticks, and the long growths are to be stopped in time to form good bushes.

#### CALCEOLARIAS.

Those who have to keep large conservatories gay with flowering plants at this season know the value of these showy plants. They are now in full bloom, and if they were kept free from greenfly up to the time the first flowers open they will get through the flowering period without any injury from the pest; the flowering shoots must be supported with neat sticks. The choicest varieties, those with a good habit combined with rich and decided colours, should be set aside from which to save seeds. The pouch should be rounded and free from corrugations.

#### CHINESE PRIMULAS.

At p. 590 it was stated that the young seedling plants would be pricked out about six in a 3-inch pot; when these have grown sufficiently so that the leaves meet together they are repotted again in the same sized pots, one plant only in each. There is no better place for the plants than placing them on a bed of ashes in a frame partially shaded. The plants are rather particular as to the amount of water they receive; it is a mistake to give too much, and I prefer to apply it without watering the leaves. Cuttings may be put in of the double varieties or of any choice sorts. Before taking off the cuttings the plants should be stinted for water until the moisture in the leaves and stems has been reduced and the stems are hard. Pot each cutting singly in fine sandy soil, and place them in a close hand-glass for a few weeks, and when roots are formed gradually admit air, and treat the same as for established plants.

#### CINERARIAS.

Treatment of the seedling plants is very much the same as that required for Chinese Primulas. The same frame will do for both, the potting material for each being good loam, a little leaf-mould and rotten manure added to it. Offsets from named varieties or selected seedlings should be put in now. Use light soil, and put in about three small offsets round the sides of a 6½-sized pot. Place them in a close hand-glass on the north side of a low wall.

#### CYCLAMENS.

The plants are quite at rest, and a good deal depends upon their treatment now whether or not they will flower satisfactorily next season. I know one ardent cultivator of the Cyclamen who quite failed to produce a good specimen last season, owing to no other cause than punishing the plants at this season by allowing them to be too dry both at root and top. I allow the soil to become rather dry before applying water to the roots, but never to the extent of drying the soil too much that it will not readily take water again. The young plants raised from seed in the spring are now growing on nicely. Up to this time they have been in the same house with the Bouvardias, and have been removed to the cold frame with them. By shutting up the frame about 5 o'clock in the afternoon and syringing the plants at the same time we obtain a nice moist atmosphere and a sufficiently high temperature.

#### FUCHSIAS.

Young specimens growing on to flower in the autumn require plenty of ventilation. The lights of the house wherein the plants are placed should be kept open night and day to their full extent, unless when high winds are blowing; in that case it will be necessary to close them a little on the side from which the wind blows. Pot on the plants as they require it in good compost. I have had the best results by using the potting soil that was mixed up for Auriculars. Stop back the shoots in good time; if they are allowed to run out too much before stopping it is so much of the vital forces wasted. Do not give manure-water

until the plants are in their flowering pots and have well filled them with roots.

#### LARGE-FLOWERED PELARGONIUMS.

If the plants have been kept free from greenfly up to this time there is no probability of its doing any harm now that they are in flower, or very nearly so. Large supplies of water are now required. Most of our plants are in 6-inch pots, each plant producing a dozen trusses more or less; and in hot dry weather they require water twice every day. The large exhibition specimens in 8-inch pots require similar attention—manure water is applied at each alternate watering. I used the "Flor-vite" last year because it is easily applied—a teaspoonful of the white powder in a gallon of water; it gave so much satisfaction that we are using it again this year. A small bottle, costing half-a-crown, lasted a whole season for about eighty plants. A concentrated manure of this kind is most useful to amateurs who cannot get manure to mix up in tubs or barrels, and who do not like the smell and mess that it makes if they could. Fancy Pelargoniums require very similar treatment to the others, but we are rather more sparing with the manure-water for them. The trusses of flowers are light and supported on short stems, so that very few sticks are required.

#### ZONAL PELARGONIUMS.

All the different sections may be placed together in regard to the treatment they require. This class of Pelargoniums is most useful to flower in the autumn and winter, and for that purpose the plants are now grown on in suitable sized pots. Autumn-struck cuttings should be potted into 7 or even 8-inch pots if large specimens are required, but for ordinary purposes neat short-jointed specimens, managed so that they will flower in 6-inch pots, are perhaps the most useful, and are best adapted for small houses. It is not difficult to over-grow them, rich soil causes too much foliage with a small proportion of flowers. *J. Douglas, Loxford.*

## Garden Operations.

### KITCHEN GARDEN.

**BET.**—There are cogent reasons which occur in connection with some vegetable products that plainly reveal that the proceeding we adopt in some instances, and aforesaid were won't to practise, was quite unnecessary. This fact may clearly be demonstrated in the case of an early crop of Beet, which in times gone by was considered to be indispensably necessary in order to have a supply of it in good condition all the year round; but since the demand for it has largely increased, and in the summer months especially, for salad purposes, we have ascertained it to be of such a durable character as to enable us to dispense altogether with the trouble and disappointment connected with growing an advanced crop of it, and to satisfy any doubts concerning the roots not keeping in good condition until such time as those of the subsequent year's crop are available for use or even for a longer period—that is, if it were required. These conclusive facts show unmistakably that a general crop of it sown at the right time—the end of April—is all that is absolutely required to meet every emergency or want. Beet is easily cultivated, and will thrive in some degree under almost any conditions; still, preference should be given to a sunny place openly situated, and soil of a light and friable description, enriched the preceding year with a good dressing of stable manure. The most convenient way is to cultivate it in drills; these should be made 2 inches deep to receive the seed, at from 15 to 18 inches apart, in which the plants when finally thinned out should stand at from 9 to 15 inches from each other. In the event of having a scanty crop, or even when a short supply of it is imminent, recourse can be had to transplanting; it will not, however, under such circumstances succeed so well as when left as a seedling plant unmolested in a natural way. Large and gross growing kinds are not so commonly to be met with in gardens now-a-days, neither should their growth be encouraged for household needs because of the coarse and colourless nature of the flesh after they are dressed for use. I would rather choose from among those improved kinds which we now possess in Henderson's Pine-apple, Sutton's Dark Red, Veitch's Improved, and Carters' Perfection, or other esteemed and well known pure sorts. The cultivation of Beet-root itself is so simple in detail as scarcely to require any further comment than to impress the importance of having it lifted before frost injures it, and in such a manner as not to break the principal root, nor in the process of topping it to cut off the leaves too closely. There is another matter

of the utmost moment, and that is its preservation after being lifted; in my opinion this matter does not in some cases have adequate consideration, for occasionally I have observed stacks of these roots placed where an abundant circulation of air is proceeding, the drying effects of which may not probably be disadvantageous in the case of large, coarse kinds, in helping forward the elaboration of the juices in the roots, and thereby making them more palatable, but in the case of such choice kinds as those I have enumerated, it would have a contrary effect, and materially contribute towards shrivelling and impairing them. Our store-house is of rather a primitive character; it is formed in the angle of two walls which run due north and west respectively, and is made by removing the soil from 2 to 3 feet deep, 6 feet wide, and in length parallel with the wall to the west in proportion to the stock of roots it is expected to hold. The roots are stacked round the sides and end of this space closely together, 2 feet wide, leaving 2 feet open space in the centre to get to them whenever necessary. In the process of stacking no soil whatever is used; the roots are simply laid in regular order, one upon another. After this is done they are covered up with straw or old mats; afterwards a rough roof is constructed at an angle sharp enough to throw off rain, &c., and to prevent the hole being filled with water and protect the roots from saturation before intense frost sets in. As a preventive against damage from frost, an external covering of straw or long manure should be applied. This material further regulates and keeps the temperature within cool and moist—conditions which prevent the roots from starting into premature growth, by which the quality is in some measure deteriorated.

**ORDINARY WORK.**—The plants from sowings which were made towards the end of last April of Beet, Salsafy, Scorzonera, and Chicory will be large enough by this time to be singled out, the former in the way recommended above. Salsafy and Scorzonera should have a space left between the plants of from 4 to 6 inches; and Chicory, grown for the sake of its roots to produce blanched leaves for winter salads, requires at least a foot from plant to plant; and all thinning of former sown crops of Onions, Parsnips, &c., which are not completed should be so without further delay. Such operations can be more readily performed after a shower, and the genial rain now falling (May 31) will materially assist to advance these operations and start the plants remaining into a vigorous growth forthwith. Whenever necessity compels the doing of this work under arid sunshine, the plants which are retained should be watered shortly afterwards, to re-establish any which might be upset thereby. The sowings demanding attention will now include Lettuce, Endive, and Radishes among salading subjects, also late Peas, Carrots to be used in a young state during the autumn months, French Beans for the same purpose, and a good sized seed-bed of Rosette Colewort for winter work.

As the plants of former sowings of Celery now pricked out into beds become fit, let them be got into the trenches at once, and be well saturated at the roots after planting. If the general crop of plants is not already pricked out this should likewise be done. Take advantage of the state of the soil after a rain to earth-up Potatoes that require it.

Proceed as ground falls vacant with the further planting of all kinds of winter stuff, including Leeks, which are in great demand at some places for making soup. Globe Artichokes.—The growth in these plants with us is somewhat later than is usual; the dividing and planting out of these have, therefore, necessarily been delayed and deferred. Let this be attended to, and give from 4 to 6 feet every way between the plants. Go over plantations of Seakale, and reduce the shoots on these plants to single growths.

**FORCING DEPARTMENT.**—As frames and pots become vacant let them be filled again with Cucumbers, Melons, Basil, Gherkins, Knotted Marjoram, &c. Early crops of Potatoes from those places have turned out well this season, and are entirely free from disease. French Beans coming into bearing will require ample supplies of water, and so also will the latest crop of frame Carrots, which should now be ready for use. Mushroom beds in bearing will need attention occasionally to watering, &c. *G. T. Miles, Wycombe Abbey.*

#### FRUIT HOUSES.

**ORCHARD HOUSE.**—In the compartment or house that was started early the fruit will be ripe, or nearly so. In that case syringing must be discontinued, although it is still desirable to sprinkle the paths and borders of the house. If the trees are in pots they will still require a goodly supply of water, but do not water a tree until it is really wanted; should the roots be kept constantly soaked with water the fruits cannot be of good flavour. The question as to the best early Peaches still crops up. I have not sufficiently proved the new American varieties, but

hope that they will be of good flavour even if the fruit should be small. Early Beatrice and Early Rivers we cling to as long as there is any hope of their being really useful. The only point is their earliness. No one cares to eat the fruit even if it does not spoil before it is ripe, which it mostly does. Hale's Early and Early York are two really good Peaches, after them Early Grosse Mignonne, Royal George, Noblesse, Bellegarde, and Barrington; the last, by the way, does not set its fruit very well in the orchard-house. In the late house thinning of the fruits must be attended to, and this should be final. The stoning period presses heavily on the vital forces of the trees, and it is therefore the more necessary that only as many fruits as may be intended to come to maturity should be allowed to remain at the time of stoning. See previous instructions as to stopping the growing shoots. I like to have this done when the points can be readily stopped with the finger and thumb. They very soon break again, and it may be necessary to stop the strongest a second or even a third time if the growth is very vigorous. Pear, Plum, Cherry, and Apple trees may be removed outside to make more room for the Peaches and Nectarines. Some growers have said that a portion of the two latter may be placed outside to ripen off the fruit after it has arrived at this stage. I have done it on one or two occasions, but the result was not such as to permit me to recommend it to others. The hardier fruit trees succeed very well indeed, in some cases produce fruit quite as good as that protected with glass until it ripens. In most cases the fruit is more highly coloured. Get ready the compost to surface-dress the trees in the late house; it ought to be done about the middle of this month. I find a preparation of equal parts good clayey loam, malt or kiln dust, and stable manure thrown together into a heap to ferment is the best I have ever used. A good handful of this spread evenly over the surface of the soil in the pot at intervals of ten days or a fortnight is the best way to apply it. *J. Douglas.*

#### ORANGE-HOUSE.

It would almost be a repetition of what was stated at p. 591 to go into the details of the daily operations required. The culture of this fruit is very simple indeed, especially if the trees can be kept clean. The insect pests that usually attack the leaves and cling to the wood cannot readily be removed by syringing; if they get bad with scale and mealy-bug, only patient hand-washing with strong soapy water will get rid of them. At the same time if the leaves and wood are thoroughly syringed once daily—twice on hot dry days—these pests do not increase much if the trees are well hand-washed to start with. I have found that Orange trees will fruit themselves into a state of exhaustion, when they have borne a load of fruit three years in succession, and the blossoms of one crop open before the previous year's fruit has been removed. Some of the trees have been rested for a season after this, and with good treatment they soon recoup themselves. *J. Douglas.*

#### CHERRY HOUSE.

Immediately the fruit is gathered from the trees let the customary plan of washing them at morning and evening by means of a syringe or engine be resumed and continued onwards until growth ceases. In the event of any insects having established themselves about the trees during the time the fruit remained unplucked, when it is gone let the usual remedial applications of quassia-water or fumigation at eventide be at once applied, and repeated if necessary until the pests are destroyed. The main point to which attention in this compartment will now be required is that which is necessary to ensure a proper development of the buds, &c., for another season's work. In the case of trees which have been forced year after year consecutively this process should not by any means be hurried on, but left to natural agencies to finish it, because the growth in trees which have been treated thus will sometimes take place at a premature period, and is a source of much mischief, and, therefore, as far as possible, it should be counteracted. In the intervening period between now and the time when the growth is completed it is very important to have the borders about the roots in a proper state as regards moisture; and in the case of trees which are not over-vigorous, or those which have carried a heavy crop of fruit, it will be advisable to help them by means of weak manure-water or some other compound: we elect for this purpose guano-water. All the ventilators should now be fully opened and left so until the trees have become fit to admit of the sashes being taken off. *G. T. Miles, Wycombe Abbey.*

#### PEACHES AND NECTARINES.

Early forced trees from which full crops of fruit are gathered through the latter part of May onwards require very careful management to keep them in health and vigour for a number of years, as Peaches that are forced through the

winter months have to mature their growth and rest through the latter part of the summer, when, to avoid getting the wood over-ripe, it will be necessary to keep the house as cool as possible after the fruit is gathered by ventilating to the fullest possible extent, exposing the trees entirely by the removal of the sashes in showery weather, and by the frequent application of cold water to the paths and floors. As the trees are cleared, all shoots that have supported fruit and are no longer wanted may be removed, to make room for the free admission of light and air, and full exposure of the foliage to the influence of water through the syringe, otherwise red-spider will speedily attack and destroy it. Any gross laterals will be the better for being stopped, but a very close system of stopping is not advisable, as anything approaching a check has a tendency to hasten the ripening of the young wood and leaves, and as this is the reverse of that which is wanted, a steady and continuous growth is of the greatest importance. Houses in which Peaches are now ripening will no longer require fire-heat unless the weather continues wet and much colder than it was through May; but changes come on so rapidly, and sudden depressions being unfavourable to flavour, the command of gentle warmth through the night and on dull days, with free ventilation, will favour the swelling and finishing of the later kinds. In late houses the tying-in of the young shoots intended for carrying the next year's crop, as well as all extension growths, must have attention. Pinch all intermediate shoots that are not wanted for the proper furnishing of the trees, and afterwards allow a free-and-easy kind of growth until the fruit is ready to commence its last swelling. The internal borders may still be mulched with good rotten dung, lime-rubble, and turfy loam, and in the event of their being well drained water may be given until it passes through into the drains. Young trees in course of training for filling a given space should be properly disbudded and stopped to the exact number of shoots required, and these should be allowed to extend to their full length provided they are equally balanced. This system of training is perhaps better adapted to houses than walls unless the situation is very good and favourable to the ripening of the wood. One of the finest walls of trees in this part of England—Madresfield Court, Malvern—was clothed in about three years, laterals and 'sub-laterals being laid in, and the fruit is all that can be wished as regards size and flavour. *W. Coleman, Eastnor Castle Gardens, Hereford.*

#### PLANT HOUSES.

ORCHIDS.—Such Dendrobiums as *D. Wardianum*, *D. crassinode*, *D. Boxallii*, *D. primum*, *D. cretaceum*, *D. lituiflorum*, *D. nobile*, and *D. moniliforme* will now have got half-way through their growing season, and in many cases the young growing shoots will be making from their swollen base numbers of young roots. It is not only necessary to prevent such roots being devoured by insects, but they should one and all have a certain quantity of fresh open compost to grow in. Where any of the above plants have crammed their baskets or pots with roots, the present will be found a good time to give them more room. In doing this there must be no shaking out the plants from their old compost, as every root has now its full share of work to do, and which it would fail to do if the least injured. Let those growing in baskets be put just as they are into larger ones, filling up the space between the two baskets with crocks, fibry peat, and sphagnum. The pot plants should be very carefully knocked out, so as to upset the roots as little as possible. If the roots have taken possession of the drainage, do not disturb them, but place crocks and all into a larger pot, and fill up round with the same compost as used in the baskets. Not one of the Dendrobiums mentioned should, even after they have been repotted, be allowed to get the least dry, or they might get a check that would cause them to finish up the young growth abruptly, and then to start a fresh batch of young breaks, which would of necessity have to be ripened up during the shortest days of winter. *D. Bensoniæ* and its variety *xanthina* will now be going out of flower, and attention must be paid to the young breaks. These commence to push roots when only a few inches high, so if the plants require fresh potting or fresh baskets let them at once be seen to, for in a great measure the strength of the next year's bulb depends upon the care and attention now given to the young break and its roots. This Dendrobium requires but a very thin layer of fibry peat and sphagnum to root in. Keep it hot and moist while growing, with its foliage near to the roof-glass. Its two great enemies are bug and red-spider, which must be held in check by frequent brushing and sponging. The autumn flowering *D. formosum* may also now be safely potted or fresh blocked; it does equally well either way, but when grown on a block it requires a little sphagnum wired over the wood for its large roots to ramble in. Grow this plant under the same conditions as *D. Bensoniæ*. The moment the spikes of flower show on the bulbs of the strong growing *D. Dalhousianum*, *D. moschatum* and *D.*

*Calceolaria*, give the plants a thorough soaking of water, and from henceforth keep them hot and moist. An excellent place to grow them in is the centre bed of the East Indian-house. Such plants as *Saccolabium guttatum*, *S. retusum*, *S. Blumei* Dayi, *S. curvifolium*, *S. ampullaceum*, *Aerides virens*, *A. Fieldingii* and *A. Larpente* will now have passed through the flowering stage, and should at once be placed in their growing quarters. If any require more root-room, give it at once, for although in the operation the points of a few roots may be broken this class of plants suffers less from repotting at this time of the year than any other. Those plants shifted in the early spring will now be all the better for a top-dressing of living sphagnum. *Saccolabium ampullaceum* should in every case be grown suspended near the glass. Two other dwarf growing plants, *Vanda conulescens* and *V. coerulescens* *Boxallii*, should be grown in the same manner. All three are charming plants when in flower, and retain their beauty for several weeks. Where grown strong enough, the *Cattleya*-like growths of *Brassavola Diglyana* will be pushing up its large and interesting flowers. At this trying period give this plant very generous treatment. The heat and humidity of the East Indian-house will not be too much for it until the flowers have expanded. These remarks will apply equally as well to *Cattleya Dowiana*—both flowering and unflowering plants of this species must for the present be kept under a growing treatment; anything like a resting treatment would finish the growth up too soon, and consequently render the plant liable to start away weak unseasonable breaks. This year's spring has been an excellent one for the flowering of that grand Orchid, *C. gigas*. Where the plants have been handled as advised in a former Calendar, plenty of bloom-buds will now be showing. To assist these plants while developing their flowers, let them be placed in a more shady position in the *Cattleya*-house, and be kept more than ordinarily moist. Even those plants of this species not flowering must now receive generous treatment, or strong bulbs need not be looked for. Leave the ripening process till after the bulbs are made up. *J. C. Spyers, Burford Lodge, Dorking.*

#### TOWN GARDENING.

BEDDING-OUT.—Now that the principal part of the hardier kinds of bedding plants should have been planted, I would draw attention to the more tender subjects. *Alternantheras* grown in pots or otherwise should have the lights off and exposed to the full air and sun, and if the weather is favourable they may be consigned to their summer quarters in the coming week. *Coleus* and *Iresine* should also be gradually hardened off by free ventilation, and if the weather is favourable fully exposed to the open air during the day. *Coleus* and *Iresine* should be good plants when planted out in town, for they will not make much growth after being put out; for, what with the dullness of the weather generally, and dust, they will require but very little pinching to keep them in bounds.

SUBTROPICAL PLANTS.—The planting of all subtropical plants, if the weather should prove favourable, may be proceeded with without delay. The *Brugmansia Knightii* is perhaps one of the grandest plants for subtropical gardening; not only is it a fine ornamental foliage plant, but its large white trumpet-like flowers are very showy, and moreover their fine odour adds a great charm to that part of the garden in which they abound. For these plants it is necessary that the soil should be of as rich a texture as possible, for they are very gross feeders, and require to be deluged with water, which always tends to impoverish the soil. They should, if possible, have a bed specially allotted to them, and provided with a carpet of some shallow-rooted plant, such as *Amaranthus tricolor*, or other light-leaved plant, to brighten up their dark green foliage. *Wigandia caracasana* should have a prominent place where subtropical gardening is practised; the soil should be rich, and good space should be allowed them—5 to 6 feet will not be too great a distance for them to expand their large leaves in. A bed planted with these, edged with *Salvia argentea*, and a band of pink *Pelargonium*, with a carpet of variegated *Pelargonium* underneath, is one of the finest of beds, seldom seen. *Polymnia grandis* is also a noble plant; this should either have a bed to itself or be planted at some prominent point of a shrubbery. The plants should be planted 4 to 5 feet apart, with a carpeting of some light-leaved plant—*Amaranthus*, *Coleus*, or variegated *Pelargonium*.

FUCHSIA BEDS.—A Fuchsia bed in a garden, if the summer is favourable, is one of its gems. If possible it should have partial shade, that is to say, it should not be exposed to the full mid-day sun; but if it can get the morning or afternoon sun, that will benefit them. Perhaps one of the best for bedding purposes is *Rose of Castile*; not only is it a good grower but it is a free bloomer, and tells better on account of its flowers being of a lighter colour than the generality of Fuchsias used for bedding. *W. Gibson, Hospital Gardens, Chelsea, S.W.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	June 7	Sale of Imported Orchids from Borneo, at Stevens' Rooms. Sale at the Mart, by Protheroe & Morris, of the Lease, Goodwill, Stock, &c., of the Floral Hall, King'sland. Sale of Established and Imported Orchids, at the Mart, by Protheroe & Morris.
TUESDAY,	June 8	
		Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 1 P.M.; Great Summer Show opens at 1 P.M., and closes on Friday night.

TO speak of THE SUN AS A PLANT KILLER may probably startle some cultivators. It is meant to do so, to startle them out of cruelty to plants into wise care and culture of them. But is not the sun the great source of plant life?

the better for the plants, is not unfrequently carried too far in practice. It hardly holds good as a fact with our modern glass, which is so transparent as to transmit almost every ray of light unimpaired in brilliancy. The intense heat of the sun often renders it desirable to allow a considerable space between the glass and the leaves or stems. This allows the air to move freely, for it is found in practice that a free motion of the air is one of the best and most potent preventatives of leaf-scorching or scalding.

Again, heat is in the wrong place when it is permitted to concentrate its energy on the

the outside of the balls, and in closest proximity to the hottest portion of the pots.

Of course good cultivators adopt means to prevent the heat of the sun from crippling or killing their plants. Double potting, the rendering opaque the lowermost squares in green-houses and conservatories, tend to keep the roots cool; but lady gardeners and amateurs, as a rule, seldom take such precautions, and the consequence is an enormous annual death-rate from the sun's heat in the wrong place. Some plants, too, are much more susceptible to injury from this cause than others. Camellias, for example, suffer perhaps more than any other plants from the

FIG. 123.—*CARLINA ACAULIS*, NAT. SIZE. (SEE P. 722.)

Undoubtedly. How then can it kill plants? Easily; for the sun is not merely the source of light, but the centre of heat. The latter is as essential as light to the health and strength of plants, yet, nevertheless, heat in the wrong place, at the wrong time, or in excess, speedily kills plants; and in practical horticulture plants are often exposed to one or more, and sometimes to all, of these evils, either in succession or together.

For example, the leaves or stems of Vines or other plants crowded up against the glass receive the heat and light of the sun in the wrong place, and are scorched or semi-scalded in consequence. The theory that the nearer the glass the more intense the light, and consequently

surface or sides of the pots. In some cases the leaves shield the roots from the scorching heat of the sun; this purpose is frustrated entirely when, under artificial conditions, the sides or surface of the pots are allowed to become unduly heated. Plants in pots on balconies, in windows, or on conservatory stages and shelves, are often half, and not seldom altogether, killed from the root-roasting to which they are subjected. We have felt flower-pots so warm that we could hardly bear our hands on them without being burned. The poor roots, that generally hug the sides of the pots closely, must indeed have a sorry time of it under such conditions; the best of them, too, are always in the worst place—that is, on

heat of the sun on the sides of thin pots. Cape Heaths, Azaleas, Epacris, and all such plants also suffer severely; and, doubtless, one great reason why Camellias do so much better, as a rule, planted out than in pots, is that the planted-out ones enjoy a more uniform root temperature, and escape the killing ordeal of root scorching.

Standard plants—including standard Roses—are often also severely injured from the exposure of the surface-roots to the sun. The top is too high and too formal, or too much of both, to give them the amount of shade provided by Nature, and disease and death follow as a matter of course the violation of natural laws. Many years' experience has convinced us that

the sun in the wrong place—that is, beating fiercely on their surface-roots—is one of the first causes of their destruction, and the same holds good of the trunks of Apricot or Peach trees at the base of a wall.

Heat at the wrong time is almost as fatal as heat in the wrong place. For example, who has not observed the serious mischief wrought in plant and fruit houses by any excess of heat in the early morning before the houses are ventilated? Allow the temperature to run up  $10^{\circ}$  or  $20^{\circ}$  before the ventilators are opened, and scorched and scalded leaves and colourless semi-flavourless Grapes or other fruit will be the natural result. So certainly do these results

at the later than at the earlier period of the day. The point may be difficult of scientific explanation, but few men of long practice will challenge that the facts are as here stated.

It may seem too far fetched to blame the sun for the evil effects of high temperatures at night, though we all know that the sun is really the prime and only source of all our artificial heat. But, most cultivators have found that any excess of heat at night is heat at the wrong time with such a vengeance that it sends plants backwards rather than forwards to any good purpose.

But plants have their times and seasons of growth, and each of these needs a different

safely inured to the open air, and will bear the full sun without injury through September and October.

Our last point—that solar heat in excess may, nay, does kill plants—is too well known to need elaborate explanation or proof. Cultivators are too familiar with cases of sunstroke in which sometimes the entire plant, oftener a portion of it, is destroyed almost in a moment. But these obvious cases of speedy destruction convey no adequate idea of the full amount of injury or destruction brought about by an access of solar heat. The sudden flux of the sap, the softening and partial rupture and derangement of the tissues, the dissipation and waste

FIG. 124.—CARLINIA ACAULIS. REDUCED TO SHOW HABIT. (SEE P. 722.)

follow that a low temperature in the morning and early ventilation are two laws strictly enforced by all skillful cultivators. But if these conditions be reversed, either through accident or ignorance, the penalties of injury or even death assuredly follow, and yet the same plants will bear, not only with impunity, but with positive benefit, a higher temperature at 4 P.M., than that which would have scalded or injured them at 9 A.M. Of course it will be said the sun is losing its power in the afternoon, and so it is. But that depends a good deal on the aspect and angle of the house, and the latter being such as to command more sun in the afternoon than in the morning; it is, nevertheless, true that the plants will bear more heat

degree of heat. For example, take the Camellia, once more, as an illustration. In its resting and through its flowering stages a temperature of  $40^{\circ}$  to  $45^{\circ}$  suits it well; apply  $10^{\circ}$  or  $15^{\circ}$  more heat to it then and its flowers fall off in showers till not one is left, and it starts into growth out of season, to its destruction and the ruin of all hopes of any or many flowers next season. But as soon as its last flowers drop, and its wood-buds begin to burst into growth, it will thrive well in a semitropical atmosphere of  $65^{\circ}$  to  $70^{\circ}$  in a semi-saturated condition, and should have every direct heating ray of the sun shut out from its tender leaves for a month or six weeks. No sooner is its young wood partially matured, and its embryo blooms formed, than it may be

of the juices, and consequent partial paralysis from exhaustion of vital fluids and force—these leave traces of weakness behind, which render the plants a ready prey to disease and insect pests of all kinds. For it is as true in vegetable as in animal life, that the weak invite disease while the strong resist it. And as to insect pests, the very excess of heat that lowers or exhausts the vital forces of plants is often most favourable for the increase and strengthening of the pests that prey upon, devour, and destroy plants. Of course it is well nigh impossible for the cultivator to protect himself from the evils of excessive solar heat in the open air, but under glass we can moderate the energy of the sun's heat by shading and

ventilation; and one of the first conditions of cultural success consists in seeing that no plant has either less or more heat than suits its character and constitution, and that this heat should be given to it at the proper time in the right place.

— **CARLINA ACAULIS.**—The illustrations of the very striking plant represented in figs. 123, 124, were taken from a plant in Mr. WARE's nursery at Tottenham. As will be seen it has the habit of *Carduus acaulis*, but in colour and texture of flower it more nearly resembles another of our wild plants, *Carlina vulgaris*. It may be said also to resemble a Sunflower nestling on the ground in a tuft of pinnately lobed glabrous spiny leaves. It is a common South and Central European plant, but not nearly so much known in our gardens as its very striking appearance would justify. It is probably a biennial, reproduced from seeds sown by preference in heat and afterwards transplanted.

— **HYBRIDS.**—Time was when hybrids were looked at askance. Some thought they were not quite proper, botanists objected to them as confusing the limits of so-called species and upsetting their nicely planned arrangements. Horticulturists thought differently; they saw their way to new combinations, further developments, progress. Then came the immense impetus given to natural science by Mr. DARWIN. Physiologists, instead of looking askance at hybrids, recognised their great intrinsic interest, studied out natural hybrids, and sought in them the solution of some of their knotty problems; and so it has come to pass that, instead of being looked on as questionable beings, they are now invested with special interest. Messrs. VEITCH have been among the foremost in this work of crossing, and no one who has seen the results obtained in their establishment by Mr. DOMINY, Mr. SEDEN, and others, will venture to deny the fact that great advance has been made from a decorative point of view, while from a scientific standpoint the gain is yet greater. The two plants we figure to-day, and for the opportunity of doing which we are indebted to Messrs. VEITCH, are *Sarracenia Chelsoni* × (fig. 125, p. 725), a hybrid between *S. purpurea* and *S. rubra*, and *Chysis Chelsoni* × (fig. 122, p. 717), a hybrid raised between *C. Limminghei*, as the female parent, and *C. bractescens*. The flowers are in racemes, each about 2½ inches in diameter, of a buff-yellow colour, the segments blotched with pink. The lip is striped with red.

— **THE GREAT SHOW OF THE ROYAL HORTICULTURAL SOCIETY.**—We beg to remind intending exhibitors at the great summer exhibition of the Royal Horticultural Society, which opens on Tuesday next, the 8th inst., that entries must be sent in this week. We are glad to learn that the show promises to be one of considerable magnitude and importance, the entries in the plant classes being very good. The display of implements, garden appliances, and other objects of a miscellaneous character, is likely to be very interesting, many of the exhibits being already in position. Many interesting novelties will be submitted to the Floral Committee, including a collection of new Crotons, from the establishment of Messrs. CHANTRIER FRÈRES, Mortefontaine, near Paris. We sincerely hope the weather may prove favourable.

— **WALL CREEPERS.**—Some of the finest and most showy of greenhouse wall creepers are Rose of Castile and Madame Cornélissen Fuchsia, and a well-known *Trachelospermum* (*Rhynchospermum*) *jasmifolium*. Fuchsias are very graceful in habit, and perhaps there are no pillar plants in existence so useful, so easily cultivated, and so showy as Fuchsias if they are chosen of free habit. Once furnish a trellis with flowering wood, keep the plant free from insects, and supply it generously at the root with rich open soil and an abundance of water in the growing season, and there need be no fear of a display of flowers extending over several months. Few persons who have seen the Fuchsias on the roof of one of the greenhouses at Chatsworth will readily forget the display. The *Trachelospermum*, although it does not last so long in flower, is also a lovely wall plant. Its white clusters of flowers, so chaste and charming to look at, and drooping over its rich green leaves, are very effective. It is one of those plants which is spoiled by over-training, and as a balloon specimen it looks, in a way, bald, even under careful training;

but given one tie to the young wood on a trellis, and let Nature do the rest, and the effect is not easily excelled.

— **THE PELARGONIUM SOCIETY.**—The Pelargonium Society's Exhibition, which will be held at South Kensington on Tuesday, June 29, promises to be an interesting affair. We are desired by the Executive Committee to intimate to intending competitors that the staging of plants should be completed as early as possible on the morning of the 29th in order to allow time for the judging in classes, and the subsequent awarding of certificates to new varieties before the public are admitted. In the case of seedling Pelargoniums not likely to be in condition for judging on the 29th special arrangements will be made for adjudicating on their merits at the floral meetings of June 22 and July 13; but intending exhibitors must give notice on forms which may be obtained from the Honorary Secretary. In connection with the exhibition on the 29th Mr. SHIRLEY HIBBERD will give a brief lecture on Pelargoniums in the Council chamber of the Royal Horticultural Society, at 3 P.M.

— **GRUBS AND THE FROST.**—How little likely the frost is to hurt some insect pests is shown by the fact that the larvæ of the Crane Fly (*Daddy Long-legs*), so prevalent this year, were exposed lately by Miss ORMEROD to —10° Fahr., or 42° of frost, without injury.

— **NARCISSUS CANARIENSIS.**—Messrs. KRELLAGE, of Haarlem, offer this rare species. It is one of the umbellate, small-crowned species, with white flowers. It is figured in BURBIDGE's *Monograph*, t. 48.

— **PINNATE LEAVES IN TRIFOLIUM MINUS.**—A correspondent sends us leaves of this plant with two pairs of lateral leaflets and one terminal. The lengthening of the axis, and the production of two supplementary leaflets, has sufficed to convert a palmate into a pinnate leaf.

— **THE AURICULA BLOOM OF 1880.**—In a budget of Auricula gossip contributed by the Rev. F. D. HORNER to this month's *Florist*, that gentleman—than whom few are more competent to form an opinion—remarks that “the usual repotting of these plants after the bloom has revealed one—perhaps the cause why the flowers of 1880 have not, on the whole, been equal to an average of correctness, beauty, and vigour. Many of the plants did not root well from the neck during March and April, and in some cases had bloomed entirely upon last year's roots. Where this was so, the winter foliage did not stand well, and I think, with BENJ. SIMONITE, that the cause has lain in imperfect maturity of the autumnal growth. The lamentable autumn of 1879 has had many floral failures laid to its cold and rainy memory, and there is the Carnation bloom yet to witness against it. The Auricula, indeed, does not need the direct brightness of the harvest-tide sun, but still an untimely sunlessness is felt, even into the very depths of shade, and there is an unripeness in the gloomy light that strikes everywhere. Up to the time of the Auricula bloom the spring had not been genial in the North.”

— **THE ORIGIN OF THE FLORISTS' PINK.**—As this is the season of the year when the Pink is in perfection, it may be interesting to record the fact, published in an old number of the *Floricultural Cabinet*, that the first Pink worthy of notice was raised in the year 1772, by Mr. JAMES MAJOR, who was then gardener to the Duchess of LANCASTER; previous to that there were but four sorts, and those of very little note, being cultivated only as common border flowers. Mr. MAJOR having saved some seed in 1771, he reared several plants, which, blooming the next season, one out of the number proved to be a double flower with laced petals, at which he was agreeably surprised, although he considered it as being only in embryo, and the prelude to still further advance, to be developed at some future period, which is now verified by the rapid strides this beautiful flower made in size and quality during the years which followed. Mr. MAJOR informed the writer of the foregoing remarks that he made his discovery known to a nurseryman or florist, and was offered the sum of ten guineas for the stock of his new Pink;

but, acting on the advice of his friends, he declined to sell, and set to work instead and increased the stock with a view to offering it in sale to the public. It was sent out to the public at half-a-guinea a pair (for it has long been a custom to offer Pinks in pairs, a custom which is continued to this day), under the name of MAJOR's Duchess of Lancaster, the orders for which amounted to the sum of £80. It is recorded that one individual ordered as many as twenty pairs, which was considered in those days an unusually large number. It would be interesting to have a bloom of Duchess of Lancaster to compare with the fine double varieties of the present day. We appear to have come to something like a pause in the matter of Pink production, as the flowers are now very large and full, and the lacing is as perfect as can well be conceived. But we never can forecast the time of a new departure in Nature, and some day there may be produced types largely in advance of our most flattering anticipations.

— **HERBACEOUS CALCEOLARIAS AT READING.**—It is only when Calceolarias are grown on a large scale that a house full of them is presented to view; and when, in addition to the number of plants, they are well grown, with that balance between foliage and flowers that constitutes perfect plants, and the blossoms are large, finely formed, varied, and handsomely marked, one can appreciate the value of this showy subject for greenhouse decoration. Such a house of Calceolarias is to be seen at the florists' flower seed grounds of Messrs. SUTTON & SONS, in the London Road. What particularly strikes the visitor is the strong, vigorous, and healthily clean character of the leaves, destitute of any insect life. And this suggests the point at which many collections, otherwise meritorious, fall away into shabbiness. The great art in growing Calceolarias is to have the foliage healthy and clean up to the blooming time, and then the balance will be maintained during the time of decorative use. Requisite shading, plenty of air, and attention to watering, will then maintain a collection in rude health. Messrs. SUTTON & SONS have attained a strain remarkable for the strength of habit the plants possess; perhaps it may be only a characteristic of good cultivation, but it is quite certain that a weakly strain will not exhibit the vigour that is found in a strong one. Those who are taking up the culture of the Calceolaria should commence with a good strain, and improve it to the best of their ability as time rolls on.

— **DOUBLE FLOWER OF RHODODENDRON DALHOUSIE.**—Mr. KNIGHT, of Floors Castle Gardens, sends us a flower of this superb plant, with a hose-in-hose corolla and several of the stamens replaced more or less perfectly by petals. The delicious perfume of the plant was in no wise impaired.

— **DOUBLE LAPAGERIA.**—Messrs. VEITCH send us a double flower of *Lapageria rosea*, in which the number of petals is increased partly by actual increase, partly by substitution of petals for stamens.

— **LINNEUS' "SPECIES PLANTARUM."**—Baron FERDINAND VON MUELLER has had the happy idea of publishing a complete index to the first edition of this work, in which the now universally received binomial nomenclature was first practically acted on in 1753. This edition has become so scarce that authors generally quote the second edition. To ensure conformity to the law of priority this Index, first compiled for the author's private use, will be found very serviceable.

— **DESCRIPTION OF PLANTS.**—Under the title of *La Phytographie, ou l'art de décrire les végétaux*, M. DE CANDOLLE has published a suggestive work on the method of drawing up descriptive botanical works which demands more than a mere cursory notice. We must confine ourselves, therefore, for the present to a mere mention of its publication, and reserve further comment till the pressure on our space is somewhat less.

— **THE PRIMROSE, THE OXLIP, AND THE COWSLIP.**—A confession of faith, even when not demanded, is often a help to the reader in understanding an author. We may then take as our standpoint the opinion—we hardly dare to call it fact—that in gardens there are the following types of Primroses:—1. The common Primrose, of various shades of colour, single as well as double, but always with a single flower at the end of a slender stalk coming

straight from the stock. 2. The Polyanthus or umbellate Primrose, also of every shade of colour, but bearing an umbel or truss of characteristic Primrose flowers on the top of a stalk sent up from the stock. When the flowers of this kind are yellow, we have an Oxlip but not *the* Oxlip. 3. The Cowslip, in which the flowers are borne in a stalked umbel, as in the Polyanthus, but often, not always, turned to one side; very variable in colour, but always Cowslip-shaped, the lip being cupped. 4. The Oxlip proper, a rare plant, so rare, indeed, that it need not be more than mentioned in this connection. We have now to call attention to a mark of distinction—if it be so—which we have only recently noticed, and do not remember to have seen recorded. If the reader will take a withered Primrose or a Polyanthus he will find, if his experience be like ours, that the corolla withers and dries up in irregular fashion, but in the Cowslip the lobes of the corolla dry up and lap over one another regularly, just as they did in the young unexpanded flower. The flower in its decay assumes the position it had in childhood. The French call this arrangement of the flower as it dies off the *post-floraison*, in contrast to the "æstivation," or arrangement of the parts of the flower in the unopened bud. Will some reader suggest a good English epithet for this "*post-floraison*," which affords useful distinguishing marks in many cases, though often overlooked?

— THE ROYAL SOCIETY.—At the election of Fellows on the 3d inst., Mr. W. T. THISELTON DYER, Assistant Director, Royal Gardens, Kew, was elected a Fellow *nom. con.*

— FLORA OF SPAIN.—The last part of the admirable *Prodromus Floræ Hispanicæ* of WILKOMM and LANGE has just been issued. It may be obtained of Messrs. WILLIAMS & NORGATE. Five thousand and eighty-nine species are described in Latin, with analytical tables, synonyms, references to plates, localities, and observations. It is a model Flora, and one which we are glad to see to be supplemented by a series of illustrations, to be published in parts, each containing ten coloured plates, and costing 12s.

— ETOILE D'OR CHRYSANTHEMUM.—We can give this plant (figured at p. 560) a high character, not only for effectiveness, but for duration of bloom and hardness. A plant has been on an outside balcony in bloom for four or five weeks, and is scarcely the worse for the exposure even now. It is interesting to note that the flower goes to sleep, not by infolding its rays over the centre, but by bending them down against the stem, and leaving the dome-shaped "disc" fully exposed.

— HORTICULTURAL CLUB.—There will be a special dinner of the Club on June 8, the opening day of the great summer show of the Royal Horticultural Society. Those wishing to be present should communicate with the Secretary, at the Club, Arundel Street, Strand.

— SIR JOHN LUBBOCK.—We are glad to see that this eminent man, representative of so many departments of knowledge, has been elected as member for the University of London. We say this without the remotest party bias, which is out of place in these columns, and almost as much so in the University. We may, we hope, look to good work being done by the new member in educational matters, and in the improvement of agricultural prospects, by promoting, amongst other things, education in those branches of science upon which all successful culture more or less directly depends. We shall advert to the subject on a future occasion.

— ELECTRIC LIGHT.—We hear that experiments on the effect of this mode of lighting for the growth of plants are to be carried out at the Alexandra Palace.

— GRAPES AT ELVASTON CASTLE.—Those who have seen the excellent collections of fruit often shown by Mr. GOODACRE will not fail to have noticed that his Muscat Grapes, especially the Canon Hall variety, are generally very fine in both bunch and berry, with an absence of the defects in setting which this Grape is so liable to. This season it and the Muscat of Alexandria are unusually promising, and notwithstanding the continued cold ungenial weather at the time the Vines were in flower, the

bunches have set as fully as Hamburgs ordinarily do. The Canon Hall Vine which produces the Grapes in question is placed right at the end of a lean-to house exposed to the east wind, and affords substantial evidence in favour of the views of those who maintain the advisability of a low night temperature during the blooming season, as Mr. GOODACRE does not keep up a heat of more than 55° to 60° whilst the Vines are in flower, and does not assist the fertilisation in any way, not even so much as by shaking the canes, simply raising the temperature in the day sufficiently to admit of enough air being given to fully dry the atmosphere. We saw them in the middle of May, when just ready for thinning, and some of the bunches were then 14 inches long. The other Vines—Muscat of Alexandria—which occupy the rest of the house gave equal promise of a crop. There is no early forcing carried out here; the first house (Hamburgs) were just about stoning, and were a very fine crop. Following these is a house containing a mixed lot, amongst which are Madresfield Court and Venn's Seedling, that look remarkably well. In the latest house are Lady Downe's, Gros Colmar, Golden Queen, Mrs. Pince, Mrs. Pearson, and Black Alicante. Some of the bunches of this latter variety last year reached 8 lb. each, and look like being as big this season.

— HARDY PERENNIALS.—A correspondent sends us the following list of those in bloom at Southwood, Bickley:—

- |                           |                             |
|---------------------------|-----------------------------|
| Achillea aurea            | Gypsophila cerastioides     |
| " subumbellata            | " repens                    |
| Armeria maritima rosea    | Houstonia cœrulea           |
| " juncea                  | Hornimium pyrenaicum        |
| Asphodelus subalpinus     | Hutchinsia alpina           |
| " tauricus                | Hippocrepis comosa          |
| Aemone narcissiflora      | " helvetica                 |
| " sylvestris              | Iris obliensis vera         |
| " sulphurea               | Iberis corifolia            |
| Anthyllis montana         | Lychnis Lagascae            |
| Astragalus monspessulanus | " vicaria splendens         |
| " hypoglottis             | Lamium longiflorum          |
| Androsace coronopifolia   | Linaria pilosa              |
| " sarmentosa              | " alpina                    |
| " lanuginosa              | " origanifolia              |
| Aquilegia grata           | Lithospermum prostratum     |
| " glandulosa              | " purpureo-cœruleum         |
| " corulea hybrida         | Lupinus Douglasi            |
| " Bürgeriana              | Mertensia alpina            |
| Ajuga alpina              | " paniculata                |
| Aubrietia croatica        | Myosotis tunicola           |
| " graeca                  | Nepeta Keicherbachiana      |
| " Campbellii              | Oniscia coccinea            |
| " Columnæ                 | Omphalodes Luciliae         |
| " Hendersoni              | Osmunda taurica             |
| Alyssum spmosum           | Potentilla aurea            |
| " montanum                | " lupinoides                |
| Arenaria balearica        | Polygala Chamæbuxus atro-   |
| " purpurascens            | purpurea                    |
| " triflora                | Primula farinosa            |
| " verua                   | " sikkimensis               |
| " norvegica               | Phyteuma Sieberi            |
| Bellis rotundifolia       | Phlox setacea var. Carolina |
| " cœrulescens             | Polemonium reptans Richard- |
| Camassia esculenta        | soniana                     |
| Cynoglossum apenninum     | Pentstemon procerus         |
| Claytonia sibirica        | Papaver umbrosum            |
| Coronilla iberica         | " arneucœum                 |
| " montana                 | " alpinum                   |
| Cyclobothra pulchella     | Ranuncula pyrenaica         |
| Campanula Warneri         | Rubus arcticus              |
| " Portenschlagiana        | Rosa spinosissima           |
| " muralis                 | " pimpinellifolia           |
| " fragilis                | " pyrenaica                 |
| " aggregata               | Ranunculus gramineus        |
| Centaurea stricta         | Rhodiola rosea              |
| " montana                 | Saxifraga nervosa           |
| Cheiranthus alpinus       | " muscoides atropurpurea    |
| Dianthus casius           | " hypnoides keteviensis     |
| " suavis                  | " hirta                     |
| " Fischeri                | " Tazettae                  |
| " neglectus               | " geranioides               |
| " corsicus                | " Schröderi                 |
| " atrorubens              | " tenella                   |
| Dodecatheon Meadia var.   | " Cotyledon gracilis pyra-  |
| " Jeffreyi                | midalis                     |
| Dryas octopetala          | " capillaris                |
| " Drummondii              | " cœsia                     |
| Dielytra eximia           | " incrustata                |
| " spectabilis             | " crustata hybrida          |
| Delphinium tricoeme       | Saponaria ocymoides splen-  |
| " nudicaule               | dens                        |
| Erius albus               | Silene quadrifida           |
| " alpinus                 | " alpestris                 |
| " hirsutus                | " maritima rosea            |
| " hispanicus              | " pennsylvanica             |
| Eritrichium nanum         | Tulipa stellata             |
| Erodium petraeum          | " persica                   |
| " cheilanthifolium        | Thalictrum tuberosum        |
| " macradenium             | Scilla verna                |
| " romanum                 | Veronica saxatilis Grievei  |
| Geum montanum             | " officinalis rosea         |
| " triflorum               | " Chamædrys alba            |
| Genista prostrata         | " pulchella                 |
| Geranium lancastriense    | " prostrata                 |
| " sanguineum              | " rupestris major           |
| " Endresii                | " orientalis                |
| " ciucereum               | Xerophyllum asphodeloides   |
| " nodosum                 |                             |

— ENTOMOLOGICAL SOCIETY OF LONDON.—The Council of the above Society has been authorised by Miss G. ORMEROD to offer the two following prizes:—£5 for the best essay on the "Early Stages of the Life-history of *Sitona lineata*, S. crinitus, or

other Injurious Species commonly known by the name of Pea Weevil." This essay to give information respecting the season of the year and the locality of oviposition, food of the larva, with locality and duration of larval and pupal stages, and best methods of prevention. £5 for the best essay on "Methods of Prevention or Remedy for Insect Attacks upon Pine or Fir Plantations, with special reference to Weevils or Sawflies." A short life-history of the insect or insects selected for observation will be required. The essays to be accompanied by specimens and any practical information bearing on the subject, such as increase of the insects through neglect, the presence of weeds, the state of the weather, the non-removal of infested timber, &c. The prizes to be awarded according to the practical utility of the essay. The same observer may compete for both prizes. Papers and specimens to be sent to the Secretary of the Entomological Society, 11, Chandos Street, Cavendish Square, W., on or before November 1, 1881.

— A GARDENER IN OPERA.—Mr. T. SMITH, the gardener at Papworth Hall, St. Ives, took a prominent part in a new opera produced recently, which although performed privately, obtained crowded audiences for several nights in succession. The composer, Mr. S. H. WILLIAMS, brought it out under the patronage of Miss CHEERE, of the Hall, and it is entitled "The Village Heroes." The music, as we are informed, was very taking and melodious, was chiefly sustained by the author, but Mr. SMITH took the part of the old man, and in that capacity sung one or two songs in excellent style. It shows that cultivation and ability in this department are quite compatible with excellence in a purely horticultural training, as Mr. SMITH was equally successful in the prize list at the Cambridge flower show last week.

— PUBLICATIONS RECEIVED.—We have received from the Botanic Garden, Coimbra, the following brochures:—*Contribuções ad Floram Mycológicam Lusitanicam*. Series 2. F. DE THUEMEN.—*Catalogue raisonné des graminées du Portugal*. Par E. HACKEL.

— THE WEATHER.—General remarks on the weather during the week ending May 31, issued by the Meteorological Office, London:—The weather during this period has been of a rather changeable character. On the 25th, 26th, 28th, and 29th the sky was moderately clear, but on the other days the weather was generally cloudy or dull. Thunderstorms, accompanied by heavy rain, occurred at some stations on the 26th, and again on the 28th. The temperature has varied very considerably, but has been on the whole a few degrees below the mean for the time of year in all districts. At the commencement of the period readings were rather high in all parts of the kingdom, and in London and at Cambridge 86° and 82° were recorded respectively on the 26th. During the last few days the thermometer stood much lower, and the nights were very cold, the lowest reading of all being 30° in the shade at Shrewsbury during the early morning of the 28th. On this occasion sharp ground frosts occurred in many parts of England. Rainfall was less than the mean in "England, S.," and over Scotland, but more than the mean in all other districts; over the greater part of England the excess was rather large. Bright sunshine shows a slight increase over the south and east of England, and in the north of Ireland, but elsewhere a decrease is reported. The number of hours shows considerable uniformity in all parts of the kingdom, but was rather greater (fifty-one hours) in "England, S.," and less (thirty-two hours) in "Scotland, W.," than elsewhere. The wind was generally south-westerly during the first two days, very variable on the 27th, westerly on the 28th, between S.W. and N.W. in most places on the 29th, and southerly to south-easterly on the 30th and 31st. In force it was generally moderate in the east and south, but fresh in the west and north, and on the 30th blew with the force of a gale at some of the most exposed stations on our western and northern coasts.

— GARDEN APPOINTMENTS.—Mr. GEORGE MALCOLM, late Foreman at Eridge Castle, has been appointed Head Gardener to J. TOMKINSON, Esq., Willington Hall, Cheshire.—Mr. CHARLES BENNETT, late of Mentmore Gardens, has been appointed Gardener to E. PIKE, Esq., Bessborough, Cork.

## Home Correspondence.

**The Falling of Peach Leaves.**—Will Mr. Keel, of Newton Park, Bristol, be good enough to explain his method of curing this? At p. 629 he describes the symptoms or remedies applied which failed, but leaves us in the dark as to what succeeded. This is rather too bad. I read my *Gardeners' Chronicle* hurriedly, I admit. When I got to the end of the half-column I thought I must have over-read something, so I read it again, and found symptoms and remedies with which we were all familiar, but not a word about the curative processes which have proved permanently effectual. Mr. Keel will see that by an oversight he left the jam out of the pie. Perhaps he will be good enough to put it in, and oblige myself and many readers. The frost of the 19th has produced the symptoms described on many trees, and it may be added that very few of us have yet found any sure and certain remedy for these disfiguring and destructive phenomena. I think the Rev. Mr. Kadycliffe propounded a paint or dressing cure some years since in your pages, possibly he also would be good enough to favour us with his experience in the *Gardeners' Chronicle*. *D. T. Fish.*

**Dying Apple Trees.**—Instances of established Apple trees dead and dying, as described by Mr. Alex. Dean in last week's *Gardeners' Chronicle*, may be seen in many orchards; but after looking carefully into the matter I have come to the conclusion that the severe frost is not to blame, but the extreme wet of last summer, which caused the limbs to canker and the roots to rot. An examination of the roots will, I believe, confirm this statement. Plums and Cherries are not such a heavy crop as they promised to be a fortnight ago. *C. L., Hounslow, May 31.*

**Odontoglossum vexillarium.**—In Mr. Smith's fine collection of Orchids at Brencham Park, is a nearly white variety of *Odontoglossum vexillarium*, which I think is most beautiful, and distinct from anything I have hitherto seen. *Henry Knight, Floors.*

**Substitutes for Box Edgings.**—Your correspondent who wishes for a substitute for Box would find the new rose-coloured Thrift (*Armeria rosea*) a pretty edging, if the soil is dry. It is in bloom nearly the whole summer, and soon covers the edging-tiles, if they are used, and they are certainly an improvement. If for a damp soil, the minor Periwinkles are beautiful hardy evergreens. The shoots should be pegged down after planting and 7 inches allowed between the plants. The edging tiles ought to be used for these also. If for broad walks or drives two rows of *Vinca* are used, variegated and green alternating in zigzag; the effect is good, as they soon become a thick mass of lovely shading in tender greens, and give no farther trouble. *Gentiana acaulis* is pretty for the purpose if the soil is damp or peaty, but in a dry loam it is unsatisfactory. *H. M. E., May 31.*

**The Cuckoo.**—In describing the beauties of Loughton your correspondent, "The Rambler," alludes to the "friendly cuckoo." I once kept a cuckoo for six months, and of all the disagreeable, spiteful, unamiable, and, I may add, unfriendly and untameable creatures I ever met with, it surpassed them all. What would the birds whose nests he spoils say of the cuckoo's friendliness? *C. L., Hounslow, May 31.*

**Venerable Yew Trees.**—To those interested in such matters, I may say that there is (or was a few years back) a magnificent Yew in the churchyard of Darley Dale, Derbyshire. It was said to be "nearly a thousand years old," and had lost several limbs in its long life, but was a most picturesque subject for the pencil. About three miles from Brecon, South Wales, there is a grand group of Yew trees in their prime, thirteen or fourteen in number. A correct spelling and pronunciation of the name of this village would be hopeless to any Saxon, male or female; but it is close to the beautiful river Usk, and will repay a visit to those who want a ramble on a long summer day. *H. M. E.*

**Epimedium Perralderianum.**—This is a species in which I have taken a special interest for some years, and observing that under the description in Mr. Baker's synopsis (p. 683) a plant contributed to Kew by Dr. Reichenbach is acknowledged, it may be of interest for me to state that as far back as 1871 there was a strong and well established clump in the old dell by the flagstaff. Its size at that time would indicate its being planted a considerable time before, and being only discovered in 1867 it must, if contributed soon after, have made fast progress. I clearly remember its recognition at Kew by Dr. Reichenbach, who knew it by sight, and that was the first botanical recognition the plant could obtain, previous reference

having been unsuccessful, though the name was with it from the first of my notice. It always appeared to me that this species had a particular beauty and distinctive feature in the undulation of the leaf-margins; from this it is always elegant, and at any time the half of a leaflet could be picked out from among all the other cultivated species. *R. I. L.*

**The Orchids at the Late Manchester Show.**—In reply to your correspondent, "An Exhibitor," who seems to assume a kind of "I am Sir Oracle" tone, I, as an exhibitor, have to say that if his idea were carried out at exhibitions the Orchid display would be very poor indeed; and if a collection is to be disqualified owing to the making up system, nearly any collection of Orchids I have seen staged both at the London and Manchester shows would be of the same quality. Cyripediums, Odontoglossums, Masdevallias, Phalenopsis, and other kinds are, as a rule, made up, that is, several plants put into one pot. Your correspondent says: "If making up is admissible, let it be done in such a manner that an appearance of naturalness is evident in the plants staged;" but "strange that any difference should be 'twixt Tweedledum and Tweedledee." Again, we are told that "the judges should have thought seriously before doing so and so." How does your correspondent know but that the judges did "think seriously"? The judges engaged at the Manchester exhibitions are, as a rule, the best men to be had in the kingdom; therefore, I do think it somewhat egotistical on the part of your correspondent to tell the judges what they should do. But his advice does not stop here. The compilers of the schedule are advised to "be a little more careful." And what is this advice based upon? Simply because they have (wisely, I think) left out the word "distinct." Surely the judges take into account the element of variety in a collection, and this I am sure has an influence upon them in making their awards. Finally, the show managers are told "that they should have a thought to the advancing and furthering of the objects for which shows were intended—to increase and extend the love and interest of the public in all that pertains to horticulture." Whether the "show managers" have this in view or not I cannot tell; but one thing I know, that no society in the kingdom has done more during the last fourteen years "to increase and extend the love and interest of the public in all that pertains to horticulture" than the Botanical and Horticultural Society of Manchester. The last bit of advice is to the exhibitors to "observe a watchful attitude." At some exhibitions we exhibitors have to observe a painfully watchful attitude, inasmuch as we have to watch for our prize-money for a very long time before we get it. Not so at Manchester; the money is there for all exhibitors on the last day of the show. In conclusion, permit me to say that I have not the slightest objection to any one making a complaint, but what I do object to is for any one to assume the "superior person." First, there is advice to the "compilers of schedules;" next there is advice to the judges; then advice to the show managers; and finally exhibitors are told what to do. *Spectator.*

I quite agree with "An Exhibitor" of Orchids in his complaints in last week's *Gardeners' Chronicle*, regarding the judging at the Manchester Whit-week Show. It is a well known fact amongst Orchid growers in this district, that practical Orchid growers are seldom invited to judge at Manchester, and there was no exception to the rule this year. It was quite visible to any one with the least knowledge of Orchids, that the prizes were awarded to large masses of colour at first sight; the plants could not have been examined point for point, as neither high-class cultivation nor value counted for anything. *Another Exhibitor.*

**May Blossom in May.**—Singularly enough, though so many plants seem late this year, the Thorns are not. Many of them have been in flower for a week or ten days, and the whole will be out in a week or so, which is early for this neighbourhood. I have often been unable to get a sufficiency of May in May to give a May dinner—one, that is, at which the dinner-table is wholly dressed with Hawthorn bloom; this year a few solitary trees were in flower by the 30th, and the whole are well advanced for the time of year. The crop of blossom, like so many others this year, is capricious, some trees being white as a sheet, and others as green as if the flowering season had not come—as to such it has not—there being no buds to expand. *D. T. Fish.*

**Ornithogalum arabicum, &c.**—I enclose some flowers of *Ornithogalum arabicum*, which a friend who sent them from Algiers tells me is to be found growing in the fields in the greatest profusion. If hardy it will be a welcome addition to the herbaceous border, where the *Trilliums*, yellow and orange *Trollius*, *Cypripediums*, *Aquilegia cœrulea* and its hybrids, &c., make so lovely a display at this season. Talking of hardy border plants, with some novel introductions it seems a case of *le jeu ne vaut pas la chandelle*, notably with *Polemonium confertum*, the

flower of which must be very beautiful, judging from the plate, but it has never survived three months with me. Nor has a friend of mine, a past mistress in hardy gardening, succeeded any better, as it seemed to be making its last dying speech and confession when I had the pleasure of visiting her garden a short time since. *H. M.*

**Passiflora racemosa.**—One reason why this beautiful climber—I had almost written finest of all the Passion-flowers—is not more generally grown is that in the hands of many cultivators it proves a shy bloomer; but this arises chiefly through errors of judgment in the treatment. The old flowering stems should never be cut off, as they flower again and again, and year after year. The same stems can hardly be termed continuous, but rather intermittent bloomers, and if left intact they will seldom be long flowerless. When they become too long it is an easy matter to tuck them up with a tie. The mode of growth and flowering of this splendid Passion-flower are so peculiar that if the same exhausted flower racemes are removed it must needs prove a shy bloomer. Again, this Passion-flower should receive little or no pruning. The shoots become flower racemes, as it were, and the more of them the better. The further and the looser the shoots run the better also they seem to flower. By attending to these hints, which have been picked up from many years' experience with this plant, it will generally reward the cultivator with a brilliant display of its most brilliant and graceful blossoms. *D. T. Fish.*

**Schizanthus pinnatus.**—Few things are more gay and useful for the conservatory during the present season of the year than *Schizanthus pinnatus* and its several pretty varieties. They are easy to cultivate and inexpensive. A 6d. packet of seed will produce 100 plants. We have a number of plants flowering at the present time in 6 and 8-inch pots which have upwards of 300 flowers on each plant. They have been much admired, and are certainly very beautiful—almost, if not quite, equal to many of the small-flowered Orchids, the flowers of which they much resemble. For flowering in April and May we sow the seed in August in rich light soil, consisting of light loam, leaf-mould, and silver-sand. When the seedlings are 2 inches high they are potted singly into 3-inch pots, and placed on a shelf in the greenhouse close to the glass, where they are kept through the winter, during which time they require but little water. As soon as active growth commences in the spring they require frequent pinching back to induce a bushy habit, which also greatly increases the number of flowers. To any one who may not have already grown these pretty plants I strongly recommend them to do so, and I feel sure they will be pleased with the result. *H. Ellis, Summer Hill, Pendleton.*

**Bougainvillea glabra.**—I can fully testify as to the hardy character of *Bougainvillea glabra*, as stated at p. 653, as I have it planted out with *Stephanotis floribunda*, and both have lived through the past winter in a night temperature seldom above 40°. From December 21 to 26, 38° was the highest point. The *Bougainvillea* is now growing freely, and showing flower at every point. *Thomas Weaver, Oakley Hall Gardens, Basingstoke.*

**Verbascum phœniceum.**—This hardy herbaceous perennial is now coming into flower, and deserves a recommendation. It grows anywhere and in any soil, is never obtrusive, as the leaves lie on the soil and never look shabby. The flower-spikes are from 1 foot to 18 inches high. When the principal spike is over the laterals continue the flowering season into August or September, especially if not allowed to bear seed. Seedlings of the year flower from July till stopped by hard frost. The colour varies from every shade of purple to pink and white. The plants may be moved with a trowel without injury at any time, even when in flower. I wonder it is not more generally grown. I have several hundred now in flower, and move them about to fill up gaps just as I please. *C. Wolley Dod, Edge Hall, Malpas, May 28.*

**Effects of the Weather on Vegetation.**—I send you a few specimens of various trees, to show you the effect of the recent cutting N.E. winds. The month of April was very mild till the last week, when the wind suddenly changed to N.E., from which point, with very slight variations, it blew hard for a month, completely shrivelling the young growth of all trees exposed to it. Indeed, the hedges and trees are scorched as though by fire. We are situated about 1½ mile from the sea, and the trees on the north side of the park, Elms, Poplars, &c., are as devoid of foliage as they were in November. I enclose specimens. In the garden we are sheltered, and so have in a measure escaped; but I fear there will be but little fruit. Plum trees were covered with blossom, but now the leaves are all curled and full of aphides. Apples and Pears bloomed well, but few are setting. Vegetables are suffering fearfully from

drought; we have not had a good rain since October 3. I never saw the ground so dry at this season. Onions, Carrots, Turnips, &c., are going back, and until we get rain, planting Savoys, &c., is out of the question; grass is brown as a berry, and, as I heard a person say the other day, smells in the fields like hay now, but it is only a few inches high. In brief, the prospects for the coming summer are gloomy indeed, and to assist the drought we have almost every day a cloudless sun and strong wind. *Thos. Woolford, Quax Park, Thanet, Kent.*

**Setting Peaches.**—In answer to your correspondent, Mr. Williams, as to the nature of the soil in which our Peach and Nectarine trees are growing and fruiting so successfully, I may say that the gardens here are old: and the original soil has got mixed with other soils, and manures have been constantly carted on to it. I may also say we grow good vegetables from the same borders, viz., Potatoes, Cauliflowers, Brussels Sprouts, and salads, all together with the fruit trees, but not cropped close up to the walls. My

recovery, still much may be done with vegetables after this time of year. The fruit, already severely hit by Whit Tuesday's and other frost will, it is feared, prove but a scant crop once more. Apples are already dropping: the Court pendu-plat, however, is not yet in flower—only a few blossoms expanded on June 1. Surely no blight, nor frost, nor stinging East winds can now rob us of good basketfuls of this useful variety. The Besspool is also late, but not nearly so late as the Court pendu-plat. Potatoes have sprung up rapidly on the heels of the frost, and are looking well on the whole. Some of the smaller-topped Ash-leaved strains are already fit to eat in the open, where they escaped the frost, and our provincial markets are full of new Potatoes from Naples and Portugal, at from 2½ to 4½ per pound. New Potatoes, however, travel badly unless in baskets, and most of these seem to have come in bags, and are badly bruised, which gives them a strong flavour. With rain and genial weather the Strawberry crop will prove plentiful and good, though with such weather it will be late. I can endorse all the praise

biton it was certainly inferior to what we have been accustomed to, owing principally to the lack of quality of the exhibits in some of the principal classes. Azaleas, for instance, which help so much to give effect to an early summer exhibition, were poor, with the exception of those sent from Mr. C. Turner, of Slough. The Pelargoniums in the amateurs' glasses were very poor indeed, and the stove and greenhouse flowering plants were far below what we had become accustomed to see. On the other hand, there were many plants of first-class merit. The collections and groups of Roses from Slough and Cheshunt were deserving of all praise, and Mr. B. S. Williams, of Holloway, fully maintained his well-earned reputation.

**Stove and Greenhouse Flowering Plants.**—Messrs. Jackson & Son, Kingston, gained the 1st prize in the nurserymen's class for nine. The *Darwinia fuchsoides* was a well-trained and finely-flowered specimen; *Pimelea Hendersoni*, a fine plant, well flowered; the centre plant, of *Darwinia tulipifera*, was also good and well flowered. The remaining plants

FIG. 125.—SARRACENIA CHELSONI. (SEE P. 722.)

recommendation is, Soil not too stiff nor too light but heavily manured, and keep the growing crops clean, not omitting the fruit trees. *Robert Smith, Kenward Gardens, Spalding, Kent, June 1.*

**The Weather.**—June has come in with a biting north-east wind—more like December than June. In the shade and shelter the thermometer is barely 50°, but in exposed positions and in the teeth of the wind, one might take it to be at freezing-point. I see by the morning papers you had a quarter of an inch of rain in London: we had none, and to-day we have scarcely had any, though it has threatened and even tried to rain several times. The two things desiderated now are thorough soaking rains and genial warm weather afterwards. Unless favoured with these soon, the cold and the drought threaten to prove as disastrous to horticulture as the sunless sappy summer of last year: but surely June will bring some seasonable weather. The garden and the farm pine and languish for a warm dripping June, to put all things in tune. A good hay crop is already out of the question, and seldom has the yield of Asparagus in the open been so scanty and poor. The early Peas are already stunted beyond

that has recently been lavished on the President, either for forcing or indoors. *D. T. Fish.*

**Sempervivum Disease.**—In reference to the hitherto rare occurrence of the fungus of this disease in Britain, the Rev. J. E. Nize, of Welshpool, who has long made a special study of microscopic fungi, writes us that he has for years searched in vain for it. It was found at Banbury in 1870, and at Birmingham in 1879, and Mr. Berkeley has recorded its occurrence in Warwickshire. If any of our readers can give us further information as to its presence elsewhere, we shall feel obliged. The original name for *Endophyllum sempervivi* is *Uredo sempervivi*, A. and S., found in June in *Sempervivum globiferum*; Léveillé terms the plant *Endophyllum Persoonii*. *W. G. S.*

**Reports of Societies.**

**Crystal Palace Great Flower Show.**—This was held on Saturday, May 29. As usual, the plants and flowers were arranged in the centre transept, and it is only just to the Superintendent to say that he made an effective use of his material. As an exhibi-

were *Dracophyllum gracile*, *Azalea Roi de Hollande*, *Clerodendron Balfourianum*, *Aphelexis macrantha purpurea*, a very good *Anthurium Scherzerianum* and *Azalea Extranzi*. Messrs. B. Peed & Sons, Norbury Nurseries, Lower Streatham, were 2d; they had a splendid *Anthurium Scherzerianum*, an immense specimen of *Pimelea mirabilis*, and two good Heaths. Mr. B. Peed, gr. to Mrs. Treadwell, St. John's Lodge, Lower Norwood, had a good group of nine, and gained the 1st prize in the amateurs' class. He was very closely followed by Mr. Child, gr. to Mrs. Torr, Garbrand Hall, Ewell. The 1st prize lot contained good Heaths and a fine plant of *Imantophyllum miniatum*, with seventeen trusses. Mr. Child was almost overdone with Azaleas. Mr. B. Peed was again 1st for six, and Mr. J. Weston, gr. to D. Martineau, Esq., Clapton Park, was 2d.

Heaths were very poorly represented for a great exhibition: Messrs. Jackson had the best, and Mr. B. Peed the 2d best, none of the plants calling for any special remark.

**Azaleas.**—Mr. Child was the principal exhibitor in the amateurs' class, but the plants were not so good as we have usually seen them come from Garbrand Hall. In the trade classes, Mr. Chas. Turner, of
